Blewbury was anciently a prebend, attached to the cathedral church of Salisbury, and was assessed in 1226 at 40 marks, and in 1534 at 54*l*. The right of nomination appears to have rested with the knights templar and the knights of St. John of Jerusalem, or hospitallers, but the Crown contested this claim. The advowson of the church was given to the knights templar by Thomas de Sandford, chamberlain to King John. Among the prebendaries may be named Adam de Osgodby, Master of the Rolls and Canon of York, 1312-16; Roger de Northburgh, Bishop of Lichfield, 1316; Ralph de Stratford, Bishop of London, 1335; and John Tinmouth, or Maynelyn, "Episcopus Argoliensis," 1511. Towards the close of the sixteenth century the estate forming the prebend, in the deanery of Abingdon, after some exchanges, was merged into the separate estates belonging to the see of Salisbury, and the prebend dissolved.

Among the former curates of Blewbury was the Rev. Morgan Jones, an eccentric character known as the "Blewbury Miser," who died worth about 40,000*l*. He wrote his sermons on scraps of paper, sometimes torn from the walls, and lay in bed while his single shirt was washed. A threadbare coat, said to have been worn by him for forty years, is now in the possession of Mr. Luke Lowsley, of the Manor House, Hampstead Norris.

Several distinguished characters were natives of Blewbury and benefactors to the parish, and among the ancient families connected with the place may be mentioned the Humfreys, still resident there. A William Humfrey lived there as far back as 1340. An interesting tradition associated with this neighbourhood is that Christianity was first preached to the West Saxons by St. Birinus on the adjacent Downs. The whole country around Blewbury is full of historical interest, and a visit to the place would amply reward lovers of antiquarian lore.

We are indebted to Mr. Luke Lowsley for information relating to several curious and interesting incidents in the history of Blewbury. He informs us that at one time the people of Aston Upthorpe, which is in the parish, had a great objection to being buried at Blewbury, and a woman who lived at Aston Upthorpe was heard to declare that if Blewbury bell rung for her, she hoped it would split. The bell was rung at her funeral, and tradition states that the bell split. A new bell was cast by a man named Hunt, who placed upon it the following inscription:—

> Three times run, and twice cast,
> Blewbury tenor was made at last.

It is said that Hunt threatened that if he did not succeed in making the bell in three castings he would destroy himself, and

it was a remarkable circumstance that he committed suicide some time afterwards, and in accordance with the custom which then prevailed, he was buried with a stake driven through his body, at the cross-roads just outside the village, at a spot still familiar as Hunt's grave. Mr. Job Lowsley, father of our informant, Mr. Luke Lowsley, was churchwarden of Blewbury at the time the new bell was cast, and he was wont to relate that he saw the bell slung up under a large yew-tree in the churchyard, and that it was filled with beer, contributed by the parishioners, and that the contents were drunk by the villagers who assembled. Mr. Job Lowsley secured two or three bottles of the liquor, one of which is still in the possession of his son, Mr. Luke Lowsley. It is a curious circumstance that although not a drop of water runs into Blewbury, springs rise in sufficient number and quantity to drive a mill, and there are numerous streams in which watercress grow prolifically, and the cultivation of it is one of the principal industries of the place. Large consignments are made to London, where Blewbury watercress is daily hawked through the residential districts, and where a ready sale is effected.

TESSERÆ.

Scale in Ornament.

THE ornaments of architecture, being executed in a very hard and durable substance, are in fact only beautiful when they appear but as minute parts of the whole. The great constituent parts of every building require direct and angular lines, because in such parts we require the expression of stability and strength. It is only in the minute and delicate parts of the work that any kind of ornament is attempted with propriety, and whenever such ornaments exceed in size, in their quantity of matter, or in the prominence of their relief, that proportion which in point of lightness or delicacy we expect them to hold with respect to the whole of the building, the imitation of the most beautiful vegetable forms does not preserve them from the censure of clumsiness and deformity. A balustrade might with equal propriety be finished in waving lines, but certainly would not be beautiful. A twisted column, though affording very pleasing curves to the eye, is acknowledged to be less beautiful than the common and regular one. In short, if the serpentine form were the only form of beauty, it might with sufficient propriety be introduced into a great number of the ornamental parts of architecture. The fact, of which every person may assure himself, that such forms are beautiful only in those parts where the quantity of matter is minute, the relief small and the workmanship more exquisite, affords a strong presumption that such forms cease to be beautiful when the general association we have with them is destroyed. It is the same limit which seems to determine the beauty of those forms which are executed either in wood or plaster for the ornament of our houses. Every person must have observed in old houses the absolute deformity of those figures with which the roofs were decorated, and in comparing them with those of modern times will perceive that the great superiority of the latter consists in the greater delicacy of the forms as well as in the greater perfection of the execution. In both, flowers and foliage are imitated, but in the one in full relief and upon a scale sometimes greater than that of nature; in the other, with the simplest relief and the finest lines that are consistent with the preparation of the subject. The terms, accordingly, by which we express our contempt or our admiration of them are those of heaviness or lightness, terms which in this subject are synonymous with massiness or delicacy. The subjects, however, are the same, and no other circumstances intervene but the superior delicacy of the forms and the greater accuracy of the workmanship.

The Tortoise Emblem in Greek Sculpture.

The tortoise enters into several traditions of different Hellenic races, and it is found as the attribute of their deities. Its general position is at the feet, and hence its name, for an obvious reason, was one of the expressions for a footstool, and it was with these wooden footstools that the Thessalian women killed the courtesan Lais in the temple of Aphrodite Anosia. The tortoise was placed at the foot of Aphrodite or Venus, of Hermes or Mercury, of Pan, of Apollo, and of Æsculapius his son, as well as upon the arm of Zeus. It has been supposed that its relation to Hermes is on account of his invention of the chelys or lyre, for which purpose this god employed the shell as a sounding-board; or from the part performed by the god in changing the envious nymph Chelone into this animal. According to another Arcadian tradition the tortoise was sacred to Pan, and this god, in the old theogony, was the son of Hermes and Dryope; but the details of the amour in which Hermes, like the Apollo Nomios, tended the herds of a mortal are wanting, and might throw considerable light upon this subject. The usual tradition, in which Mercury, surnamed Akakesios, discovers the tortoise upon Mount Chelydorea is all that can be deemed certain. Not so with respect to Apollo; it appears that he became enamoured of Dryope, the only daughter of Dryops, King of Oeta, and that in order to effect his purpose, while she was playing with the Hamadryad nymphs, the god changed himself into a tortoise, and when taken up as a plaything by her and placed in her bosom suddenly changed himself into a serpent, terrified the nymphs, and became, by her, the father of Amphiesus. The collections of Antoninus Liberalis are so filled with traditions totally distinct from those of the earlier writers that it is extremely difficult to verify the notices he gives, yet there is reason for believing that the tortoise anciently had an intimate connection with Apollo, for when Crœsus sent to the oracles of Asia Minor, Greece and Libya to try their discernment, he cut up and seethed in a brazen pot a tortoise and lamb—a very significant act if it is considered that they were the animals sacred to the gods Apollo and Ammon.

The Chancel in English Churches.

It is a curious fact that, strictly speaking, the chancel, in the modern sense of the word—*i.e.* denoting the eastern portion of a church—is not legally part of the church at all, since the parish is bound to keep the church in repair but not so the chancel, which belongs to the rector, and the rectorial estate is chargeable with these repairs. Instances have, unfortunately, too often occurred in which landowners who have become lay rectors have evaded their duty, and of chancels actually being pulled down to avoid the cost of keeping them in repair. A curious archæological fact may be occasionally noticed arising from the negative position of the wall separating the chancel from the nave, which, as Mr. Parker ingeniously remarks, is frequently the oldest part of the church, the chancel having been rebuilt at one period and the church at another, while this wall and arch has been left standing in both, and he states his belief that even now it is, as it undoubtedly was in former times, a disputed point in law to which portion of the edifice the said arch properly belongs, and consequently on whom the duty of repairing it really should fall. The whole subject is one of great interest and not easily to be unravelled, owing to the complexity of evidence and the oft-discussed but rarely settled questions to which these contrarieties give birth.

James Wyatt, R.A.

The birthplace of James Wyatt was Barton Constable, in Staffordshire, where his father was both a farmer and dealer in timber. He was born in 1746, and at an early age was introduced to Lord Bagot, who being then about to set out for Italy, as ambassador to the Pope, took Wyatt with him. He was fourteen when he arrived in Rome, and he spent there three or four years, examining the principal monuments of ancient architecture, but, it would seem, without imbibing any taste for the modern architecture, since no traces of it are discoverable in his own works. On quitting Rome he proceeded to Venice, where he studied for about two years more under Vicentini, an architect and painter, and then returned to England, after being absent altogether about six years. His design for the Pantheon in Oxford Street, which was finished and opened in 1772, at once stamped his celebrity, and he thenceforth became the "fashionable" architect of the day. It was fitted up in a style of splendour till then unprecedented in this country, and was eminently attractive as the resort and rendezvous of the gay world, yet how far it merited all the encomiums passed upon it as a work of architecture it is now hardly possible to decide. Though it was esteemed a masterpiece, no copy of the original designs has been preserved to us as an authentic memorial of Wyatt's Pantheon. There exist, indeed, views of the great room or "rotunda," but they are such that very little reliance is to be placed upon them, and even were they satisfactory in themselves, they furnish very imperfect information; nor is more to be obtained from description, nothing deserving to be called so having been written at the time. The Pantheon seems to have been the only building in the metropolis executed by Wyatt, for he obtained no more commissions in London, either public or private. Commissions poured in upon him, but all from different parts of the country, and chiefly for private residences, the majority of which hardly aspired to the character of mansions. Wyatt's Grecian style, admired in his own day for its then almost proverbial "simplicity" and chasteness, now strikes us as being very *jejune* and bare, and not so marked by as deficient in that artistical simplicity which results from uniform finish throughout, perfect harmony of character and unity of expression. There is more of the pretty than of the beautiful, of the neat than of the elegant, of the plain than of the simple, in his so-called Grecian or Græco-Italian style; nor could it, perhaps, be better described than as a sort of genteel commonplace. Probably he would have done more in his art had he been employed on fewer works, for the multiplicity of his professional engagements prevented him from bestowing much study on the respective designs. It has been recorded of him as matter for

admiration that he was in the habit of improvising his designs while travelling in his carriage to the places he was about to be employed at; no wonder, therefore, that so many of them present such sameness and poverty of ideas, and so very little study, being apparently little more than first hasty sketches with hardly any revising. Accustomed to this specious commonplace and indolent fertility, he could scarcely rise above it on occasions which either demanded or afforded opportunity for achieving something really noble. His design for Downing College, Cambridge, where, however, he was not eventually employed, was animadverted upon in a letter from Mr. T. Hope to the architect himself as being altogether unworthy of the occasion. About 1784 Wyatt began to turn his attention to the Gothic style of architecture. At that time there were no publications, as at present, to initiate the student into the art and facilitate his progress by exhibiting specimens ready drawn and measured, so that Wyatt had to draw and measure for himself, which, it must be remembered, was a great disadvantage. It is therefore highly to his credit that under such circumstances he gained the insight into it which he did. His first essay in the Gothic style was Mr. Barrett's, at Lee, near Canterbury, which he executed in 1783, and which was as happy a hit in its way as the Pantheon had been. In making alterations and improvements in the older edifices in that style he was extensively employed at some of the colleges at Oxford and at the cathedrals of Salisbury and Lichfield. Besides the edifices before mentioned he was also employed at Woolwich, the House of Lords, Windsor Castle and Kew. In 1802, on the retirement of West from the office of president of the Royal Academy, Wyatt became his successor, to the no small dissatisfaction of that body, who viewed with jealousy an architect in the chair. He was, however, not long seated there, for the following year West was re-elected. James Wyatt died September 5, 1813, in consequence of being overturned in a carriage while travelling from Bath to London. He left a widow who survived him four years and four sons, one of whom was the architect for Drury Lane Theatre. Notwithstanding his very extensive and lucrative business James Wyatt was so far from accumulating a fortune that he was often involved in pecuniary difficulties.

Lombard Architecture.

Mr. Hope remarks that "in Lombard buildings the whole of the strength requisite for support and resistance is sought in the general thickness of the wall." This power of the wall constitutes the theme of the Lombard system of expression. The most common and peculiar decoration of the Lombard style is a sort of recessed panelling, produced, as it seems to the eye, by removing a certain thickness of the wall and leaving a band of the original thickness, which follows the outlines of the walls and surrounds the recessed spaces. This recessed space is seldom allowed to be large enough to admit of the eyes resting upon it to the exclusion of the raised surfaces. If the front or flank of the building is too large to be thoroughly taken in at once, its surface is divided up by strips of wall dropped from the upper projecting surfaces or "wall plates," or sometimes sent across from the perpendicular strips at the angles. These bands are of little, often of no use, to the wall, the true buttress form is carefully avoided in them, but they powerfully aid the Lombard expression by beginning, as the like Greek architecture began, with a delicate but decided assertion of a superabundance of the kind of power to be displayed. The office of these "wall plates" is greatly assisted by their reception of a degree of enrichment greater than that which is conferred upon the principal recessed surfaces. This enrichment, which consists in its most frequent and most efficient form of a series of simple arch-heads or "scollops," impresses on the eye the existence and character of the raised wall-plate, and is therefore "decoration" precisely in the same sense as the Greek fret or egg-and-dart is decoration. These recessions of the general surface of the wall are seldom limited to one degree; the recessed face recedes again behind a series of shallow arcades, and yet again, arcade within arcade, and in the upper parts of edifices there are often actual galleries practised in the enormous thickness of the wall. Apertures are turned to account with great skill; the chamfer or bevel of those which are to give light, contrary to the method which would be dictated by mere utility, is often chiefly external, and its depth is commonly marked and even exaggerated to the eye by a perspective of elaborately carved mouldings one behind the other. Lombard doorways of large dimensions are often approached by an advanced porch, and we do not perceive, on entering, where the porch ends and the wall begins; thus the eye is saved from the disappointment it might suffer upon perceiving that the wall decoration had indicated an amount of thickness which the wall, however solid, must have failed to realise. The devices employed on this feature for augmenting the importance of the wall are various and highly interesting, but they are too numerous and require too much technical explanation to be described here. There is one, however, of the most common and effective of these methods which we must not pass over. When there is no porch a great part of the thickness of the wall is traversed and forced into notice by the shafted and moulded arch, but before the wall is pierced this chamfered approach stops and is made to include a portion of plain wall with an aperture, of which the head is horizontal and the jambs plain and at right angles to the face of the wall. Thus there is a series of deep recessions from the outer wall surface which, when they terminate, leave a further thickness to be traversed by the true aperture, the rectangular cutting of which leaves the remaining thickness, when the spectator is not absolutely within the doorway, to be measured by his imagination. The outlines of apertures are most appropriate. Doorways and arcades always adopt the semicircular arch, and the most characteristic form of the Lombard window is the perfect circle, exhibiting the principle of the arch, of which, as we have said, the proper object is the wall, in its fullest development. The rosette window is the invention and most striking feature of Lombard architecture, and it is impossible to imagine a more admirable means of giving effect and artistic importance to the wall than the presence, in every principle façade, of the great circular window, revealing by its deep and decorated chamfer the vast power to which, by its form, it expresses an infinite power of resistance. The filling up of this window, when it is large, by thick bars radiating from an inner circle, like the spokes of a wheel, excellently and obviously subserves this expression. Ornament in Lombard edifices is beautifully subordinated to the effect of pure masses of wall. It clusters about windows, cornices, string-courses and doorways, and breaks out occasionally upon the wall itself, but it is always felt to be a judicious and brilliant foil rather than an interruption to the plain and principal wall surfaces. This is the right economy of decoration, for that which is all decoration is no decoration. Decoration should always, as in this case, subserve an object, and not be an object in itself. Lombard decoration was moreover fitted, no less by its peculiar character of amazing and apparently reckless variety than by its skilful distribution, to give expression by contrast to the pure sheets of the all-important wall.

Temple Statues of the Greeks.

In Greece, as in other nations, the first employment of sculpture was to serve the cause of religion, and for a long time it was, as elsewhere, subjected to a strictly prescribed mode of treatment. Its development in forms of exquisite beauty was owing to peculiar causes. The chief may be found in the extreme sensibility of that people to material refinement; and next, it may be attributed to the impulse given to that predisposition by the sublime notions put forth, first by Socrates and then in the philosophical system of Plato, who propounded the almost divine dogma of the connection or union of the good and the beautiful. This was accepted by his fellow-countrymen, and especially by the acute and sensitive Athenians, as almost an inspiration. The great sculptors of the age of Pericles, beginning at about 450 years before Christ, first gave expression in art to this revelation of a new system, and their gods and heroes, their divine and semi-divine personages came from this time to be represented in forms of appropriate perfection and beauty. Before this the images were but types of ideas without any regard to their having agreeable or pleasing forms. Indeed, the idea was rather to make them terrible than attractive, and, as deities, exceptional; and it is curious to read how opposed the priesthood appears to have been at first to the innovation upon old usages which the new doctrine occasioned. The prejudice of this body was doubtless strengthened by the fear that any interference with established religious representation might weaken their moral influence. The form given to the gods had hitherto been received by the people as the authorised and orthodox mode of representation, and there were not only spiritual but material interests at stake should the new light that was breaking in upon the sensibilities of the community place the hierarchy in a less important position than that which they had so long occupied. Phidias, the great sculptor of the age, was boldly charged with sacrilege for having in one small particular innovated upon established usage by introducing a lay element—a portrait—in one of his most celebrated Temple statues. By degrees, however, this ground was abandoned even by the priests, who, perhaps seeing in time the policy of not offering a useless resistance to the tide of public feeling, wisely joined in recognising the new sentiment that had sprung up. The practice of sculpture was thus entirely changed, and what was great and noble in intention or sentiment was made also noble in the form in which it was presented. But still, for a considerable period the mission and object of sculpture was in its service to the Temple. Whether the god or goddess was to be represented, or whether the great deeds of the persons of their hero-worship were to be illustrated, it was all more or less connected with their religious system. It was later, when this exercise had led to its material perfection, that its employment on other and less noble objects was introduced. Its beauty then became so attractive, irrespective of its purpose, æsthetically, that it was sought for this quality exclusively.

NOTES AND COMMENTS.

The Corporation of Liverpool, like similar bodies in Scotland, are responsible for the conservation of certain churches and the salaries of the ministers. The advantages of the arrangement are not apparent to all, and the returns for the outlay are unsatisfactory. In Scotland there is a close alliance between Church and State, which may account for the appropriation of money towards ecclesiastical work; but in England there are enough secular needs to employ all the cash that can be raised by rates. A return that was made out a few weeks ago in Liverpool, showing the outlay on churches, was enough to amaze the citizens, the majority of whom probably were not aware of the extent of the expenditure. It is not surprising that an effort is to be made to get rid of so expensive a privilege. The Finance Committee of the Corporation, after considering the return, passed the following resolution:—"That in the opinion of the committee it is desirable that Parliamentary powers be obtained for making provision for the extinction of the present liabilities of the Corporation in connection with the Corporation churches, and for the pulling-down, removing or otherwise dealing with some of the churches, subject to such terms and conditions as may be imposed by Parliament, and that with this object the Council be recommended to refer the consideration of the matter to the Parliamentary Committee with instructions to prepare a scheme for submission to the Council." The people of Liverpool will, of course, have to pay a good sum to become free. If the churches were of architectural importance it might be wise to entrust the care of them to a public body, although in Liverpool the Corporation would not be qualified to undertake such an office; but, as it would be difficult to spoil the majority of them, the congregations may well be trusted with upholding them.

The French Historic Monuments Commission should be entrusted with an adequate sum of money to complete the restoration of the castle of Pierrefonds, or the quarter of a million sterling which was expended under Viollet le Duc will be in a measure thrown away. That marvellous draughtsman was not entrusted with many buildings by clients, and it is not a wonder that, having but scant experience of materials, an unsuitable stone should be selected by him for his restoration of Pierrefonds. The consequence is that a large part of the masonry already needs to be removed; and, in fact, the difference between old work and new is recognisable by the number of defects which are apparent in the modern masonry. If the restoration had been completed there would be fewer spots exposed, and the rain could not so easily operate on the interior of the walls. Whatever may be the cause that originated the dilapidations, Pierrefonds is so important a show-place it will not be wise to allow further decay. It is well to have a substantial building in order to induce visitors to imagine that the castle in its pristine condition corresponded with what they behold.

The county surveyorships of Ireland, which are now obtained by competition, are not among the prizes of the engineering profession. Among the classes of works which they have to undertake are maintenance of public roads and footpaths, and the construction of new ones; maintenance of bridges, retaining walls, fences, pipes, &c., and the construction of new works; hill-cutting and other improvements to public roads, maintenance of court-houses and various public buildings, superintendence of tramway construction and works which entail interference with the county roads, maintenance of piers, quays, landing slips, &c. For accomplishing these duties a moderate salary is given, and however large may be the county there is no allowance to the surveyor for his own or his assistants' travelling expenses. As some of the counties are divided, there are forty-three surveyors and one hundred and fifty-eight assistant surveyors. The roads under their superintendence measure over 51,000 miles, which are maintained by an annual outlay that is small if compared with England. The cost of supervision is 5·28 per cent. on the expenditure. It is plain therefore that the surveyors are guardians of economy without much advantage to themselves. It is not their fault if they are compelled to have recourse to methods that an English road surveyor, although he may only have a farmer's experience of work, would consider to be primitive. The Grand Jury, who make all the fiscal arrangements, are not authorised to purchase steam-rollers, tools, instruments or appliances of any kind. If a stone depôt has to be formed for materials, the cost must not exceed twenty shillings. The contractors, on the other hand, have reason to grumble, for they are paid only twice a year, and as the lowest tender must be accepted, they can never anticipate much profit for their enterprise. As a result, the wages paid are at the lowest, and it is no wonder the men who break stones or mend the roads get through their tasks in a manner that annoys every English traveller who passes by, and who concludes from what he sees that the Irish labourer is slothful.

Perugino died of the plague in 1523, and as yet there is not even a humble memorial of him in any part of Italy. Fortunately he left a portrait of himself in the Sala del Cambia of the city from whence was derived the designation by which he is known. There are also works enough by himself and his pupils to preserve his reputation from oblivion, although connoisseurs may not, like the cousin in the "Vicar of Wakefield," make it a rule to set up Perugino as a sort of standard. At last an effort is to be made by the Italians to show that they have not entirely forgotten the master who taught Raphael. It is intended to raise some kind of monument in Perugia to the memory of Vannucci if money can be raised; but the Italians are shrewd, and are likely to say to the committee that if the painter's name has remained among the renowned for nearly four centuries without the aid of statues or fountains, it may manage to be remembered while the world lasts.

The Americans have discovered the advantages of living as high as possible above street noises and in pure air. It appears that the last year's receipts from the tenants of the tower of the new auditorium in Chicago amounted to nearly 16,000*l.* An offer of 10,000*l.* a year has been made to the committee of the Masonic Temple of Chicago for the apartments in the roof. At that rate a large return is expected to be derived regularly after the visitors to the World's Fair have departed. During the fair there will be enough people to pay for reaching the height a larger sum than 10,000*l.* The owners of old buildings in German towns, where the vertical measurements of the roofs are sometimes not less than that of the house to the springing, must often wish that a similar fashion prevailed in Europe, for in most cases the space within the roofs is useless. A cheap system of lifts that could be readily applied might, however, enhance the value of many a German and Dutch house.

The latter years of Louis Gallait's life, it is said, were embittered because he was not elevated to the peerage. An artist who, according to some, was the foremost of the painters of Belgium would not gain much by becoming a Belgian baron, but men of genius are not exempt from the weaknesses of ordinary mortals. His townsfolk of Tournai have now before them in the esplanade of the park a statute of Gallait, who appears standing in the costume he commonly wore in his studio. It is the work of M. Charlier, a young sculptor. Gallait was born in Tournai in 1810, and it was not long before he proved his competence as a painter of history. He was fond of scenes from Flemish history, and his picture of the visit of the Spanish governor to the chamber where the decapitated corpses of Egmont and Horn were lying excited more interest than any other modern work in Belgium. But he was not confined to that class of subject. His *Temptation of St. Anthony* made compensation for the unsatisfactory versions of the legend which Flemish painters formerly produced, and his figure of *Louis XVII.*, who was seen crouching in a corner after illusage by his shoemaker-master, was impressive enough to be used as a text by the late Prince Consort for a little sermon to his sons. It may be doubted if Gallait's fame will endure. His execution produced such smooth pictures that people say there is no vigour in his work, and his best paintings are not to be compared with those of Albrecht de Vriendt's, the worthy head of the historical school of Belgium.

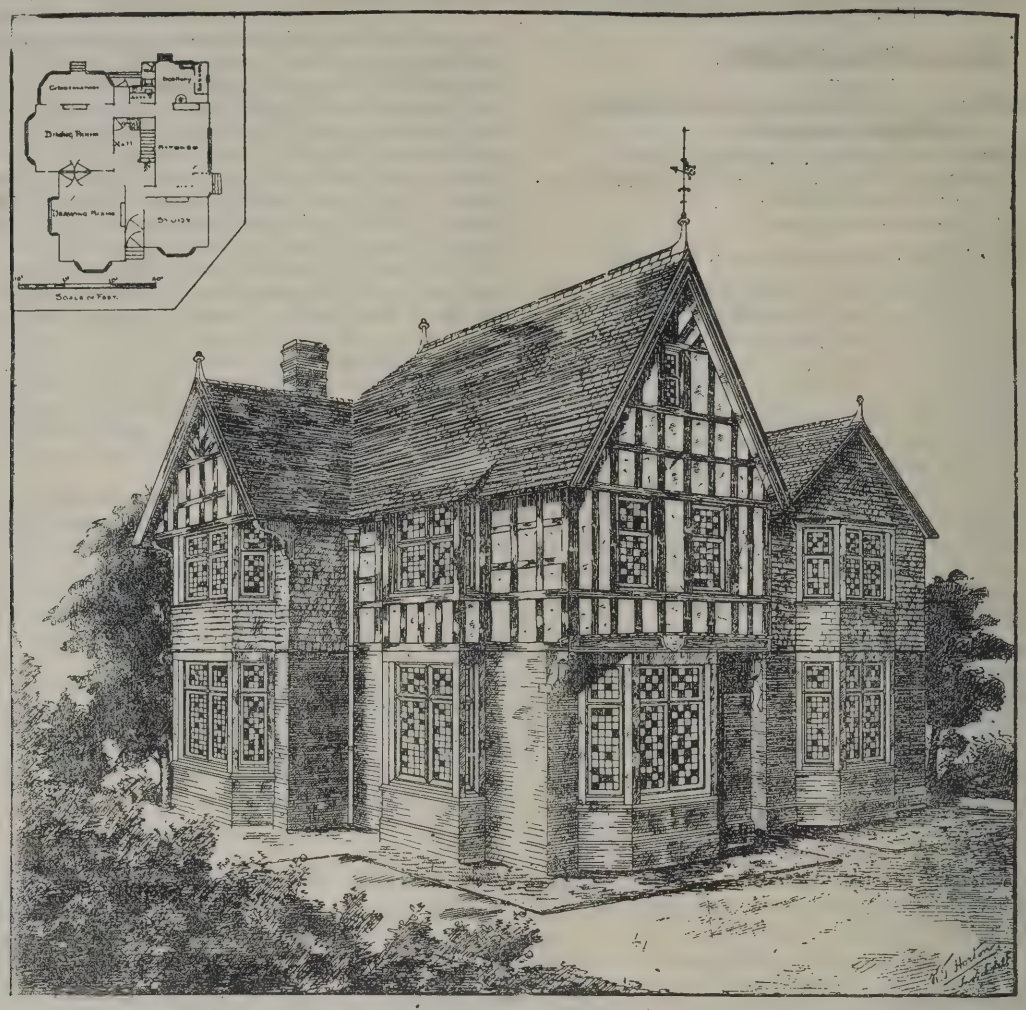
TRINITY U.P. CHURCH, POLLOCKSHIELDS, GLASGOW.

THE site of this church, which was opened a fortnight ago, is one of the finest on the south side of the Clyde, the ground being 15 feet to 20 feet above the road levels. The church is planned as nave and aisles, with a recess 20 feet deep and full width of nave, in which is placed the organ. The communion-table takes the centre position in the choir, in front the elders' and choir seats being ranged right and left, and the minister's chair at the table making a good screen for the organ-player. The whole of the fittings and furnishings of this part of the church are richly designed and carved in solid oak, and being lightly stained agree very well with the polished ashlar red stone lining the walls. In the windows above the organ there are some good bits of stained-glass. The nave arches are carried by Peterhead granite piers, with richly-carved stone capitals and moulded bases. The gallery front, wall linings, doors and their finishings, pewing, &c., are all good examples of their kind, showing an amount of care and thoughtfulness in detail not by any means common in our everyday, moderately-priced church work. The pulpit and the font —the latter not yet finished, however—surpass in richness of design and colour, and in the rare skill and art-craftsmanship put forth by the carvers upon them, all the other fittings with which the church has been so handsomely gifted. Built of Corsehill red sandstone, with green marble shaftings in the upper and lower stages, the panels of the upper stage are filled with beautiful examples of onyx finely marked in colours, and so transparent in parts that light could be seen through about a thickness of an inch where only one face was polished. The coping is wrought in richly-coloured alabaster with a good effect of transparency in it, and selected for its soundness as well as colour. The varying tones and colours of the marble, alabaster and onyx have a rich setting in the red sandstone cusped and carved traceries of the canopied work which surrounds and partly encloses them, apart from the foliated string-courses and crocketed terminals of the inner shafts of the lower stage. The book-rest is of black hammered iron, richly wrought with well-modelled work of a vine-leaf pattern. The massive high-backed and gabled chair is wrought in solid oak, ornamented with cusped traceries and richly carved. Altogether this church may fairly mark a step in advance in the treatment of the interiors of United Presbyterian churches at any rate, and it is creditable to the taste and liberality of those in authority that this is so, and that the architect was practically allowed a free hand in the arrangement of what must be regarded by many as a novel and artistic interior. The gasfittings, of black hammered iron, wrought mostly as pendants, but with a few wall brackets, have been made by Messrs. James Milne & Son, Glasgow and Edinburgh. Messrs. Dawson & Sherriff, Glasgow, were the carvers, and did the pulpit, &c.; Mr. James Morrison, joiner, did the oak fittings; and Mr. Crawford did the oak carvings. Mr. John Sim was the clerk of works, and Mr. W. G. Rowan, 234 West George Street, Glasgow, was the architect from whose drawings and details the whole work has been completed.

STANDLAKE CHURCH.



THIS building has just been restored by Mr. Barnes, builder, under the supervision of Mr. Clapton C. Rolfe.

Standlake Church is, the *Oxford Chronicle* says, five miles or so from Witney, close by the river Windrush, and lower than the level of the water. This edifice is dedicated, some affirm, to the Glory of God and of the Holy Cross, but it is more probable that St. Giles is the patron saint to whose especial honour the original building was erected. It has been pronounced by a well-known authority to be "one of the most beautiful amongst the groups of churches of the upper Thames." It is eleven years ago since the present rector, the Rev. Lewis S. Tuckwell, first commenced the restoration of the venerable pile, much of which dates from the thirteenth century, and the work was begun, as it has now just been finished, from the designs of Mr. Clapton Crabbe Rolfe, Holywell Ford, Oxford. The first section (the nave) was dedicated, after renovation, in 1881, and two years afterwards the south aisle and transept were restored, and four years later the five bells were rehung, and a new one added to the belfry in the quaint old western tower. The north transept and adjoining aisle were restored in 1888, and now through the earnest exertions, and greatly through the munificent liberality of the rector and his personal friends, the chancel has been partly rebuilt and most conservatively restored, so that, at last, the work that has so steadily gone on for all these years (at an outlay of something like 6,000*l.*) is completed. Perhaps the greatest glory of Standlake Church is the unique character of its sumptuous oak carving, the greater part of which is figure work. Indeed, in the body of the church, the story of the saints in the English Calendar is vividly told by the representations of many of their number, carved on the various bench-ends.

In the chancel two Late Perpendicular (fifteenth century) windows have been blocked up, and in their places two thirteenth-century ones, that have been discovered during the progress of the restoration, have been opened out. The roof is entirely new and of most massive character, all of English oak and richly carved. Amongst the timbers occur a number of almost life-sized angels, crowned and with wings fully extended. These play musical instruments, and the roof itself is supported on sculptured stone corbels, representing other angels, also with musical instruments of ancient type in their hands. The motive for this, as it were, celestial choir, has been the well-known minstrel gallery at the Exeter Cathedral. The roof is one of the finest, if not the very finest, in any country parish church in the country.

THE GROWTH OF GLASGOW.

AT the last meeting of the Dean of Guild Court Dean Ure said as that was the last Court at which he would preside, he took the opportunity of making the annual statement of the business engaged in during the last twelve months. The only thing that made it differ from the immediately preceding years was that the number of linings asked for exceeded those of any of the years since 1878. In some of those intervening the aggregate value of the buildings authorised exceeded the computed amount of those which had this year been passed. That was notably the case in 1883, when the Municipal Buildings were authorised. The total value of that year's work was 697,000*l.* This year it amounted to 590,810*l.* In the two years of his deanship buildings had been authorised the cost of which was computed at over a million sterling. During last year they examined and passed the plans of several public buildings—halls, churches and schools—the value of which was about 50,000*l.*; houses and shop property to the value of 233,500*l.*; warehouses, stores and workshops to the value of 179,000*l.*, and alterations and additions amounting to 68,300*l.* The dwelling-house property authorised was fully 300 occupancies more than in the previous year—1,561 was the number this year, as against 1,253. He was glad to say that the excess of this year was all in the better class of workmen's houses. Of single apartment houses there were only 230, as against 321 in the previous year; 778 of two apartments, against 666 in the year before; of three-apartment houses 474, against only 191 in the previous year; of four apartments and upwards there were 79 houses last year, and 75 in the year before. It might appear singular to those not acquainted with our circumstances that in this great and wealthy city the number of small houses now being built was still so great as compared with those of larger size. Of course the explanation was that the eligible sites within the city for better-class houses had already been taken up, and builders had now to go outwith our present bounds. As an evidence of that he found, looking back to the work of this Court some sixteen or eighteen years ago, that there were many more houses being built in the city then of six rooms and upwards than there were now. The Master of Works had furnished him with a memorandum of yearly linings granted by the Dean of Guild Court from September 1, 1872, down to the present time, and he found from it that within the first five years ending in 1887 there were linings granted for 300 houses of six rooms and upwards, whereas during the last five years there had only been the plans of 32 houses of such sizes presented to the Court, and in the past two years only three of over five apartments. He was sure they were all glad to know that the cause of this anomaly would now cease—the great annexation of territory accomplished last session of Parliament extended the city bounds in November next over much land most suitable for building these better-class houses upon, and he had no doubt that his successors in this chair would for many years to come have an increased number and higher standard of house property to report.

Residence at Ashford, Kent: for H. Horton Esqre. W.T. HORTON. ARCHITECT.

LANDLORDS AND LEASES.

THE following additional letters on this subject have appeared in the *Times*:—

Mr. Sextus Dyball writes:—My letter, for which you kindly found space a few days since, seems to have been misunderstood by those whose replies you published on Saturday. The remarks of the riparian house agent may, I think, be passed over. His experience in dilapidations must be of the most elementary character, or he would know that, whether acting for landlord or tenant, a surveyor is bound by the four corners of the lease, which either clearly lays down or implies the extent of the tenant's liability. His insinuations induce me to quote the utterance of the judge who, when it was represented that a defendant would be ruined and for ever impoverished if a certain action could be maintained against him, answered, "What is that to us? It is better that he should be entirely ruined than that the law should be changed for him." That, I take it, is the spirit in which any professional man worthy of the name would look after his client's rights. The remaining letters I have read with interest, tempered by regret that the writers should have failed to grasp the point which I raised. "F. S. I." complains that the growing tendency of the age is to rebel against the very principle of repairing leases—a statement in which I heartily concur, although from the standpoint exactly opposite to that which he takes up. The very essence of my argument is that the covenant to repair is not a covenant to improve the building, or even to keep and yield it up in as perfect a state as when demised, the tenant being bound only to take care that it does not suffer more than the natural operations of time and nature would effect. That is the equitable construction of the law of dilapidations, upon which I maintain the repairing covenants in leases were formerly based. Compare it with the covenant quoted in my first letter. Can "F. S. I." show me such a one in any ordinary lease of forty or fifty years back? Will he contend that inside painting, papering, colouring, flatting, graining, marbling, gilding, varnishing, decorating and French polishing during the last three months of the fifth or seventh, fourteenth and twenty-first years of the term are necessary for the upholding and maintenance of the structure? He says that the landlord only asks the tenant to give him back his house in the same state as it is delivered over; but I would ask, For what purpose does the tenant take the house—to shut it up in a glass case or to live in it? If the latter, does he not pay a full rack-rent for the privilege of using and occupying it? And if he uses and occupies it in a reasonable manner, and takes care by the proper execution of repair that it does not become more depreciated than it necessarily would from such reasonable use and occupation, or from the natural operation of time, what more ought to be expected of him under the old and equitable construction of a tenant's liability? Of course, a landlord has a perfect right to make the best bargain he can, and the same right appertains equally to a tenant. With a legal contract nobody can interfere, although, undoubtedly, as "F. S. I." points out, tenants, from either sheer ignorance or carelessness, frequently do sign leases without giving any heed to essential conditions of the structure. I agree with him as to the "schedule of defects," although, strictly speaking, even that would be of little avail if the covenant should be to keep and leave the premises in repair, it having been held that a tenant is not in the position to do that unless he first puts them into repair. "H. T. P." inquires if I want a landlord to let his house at less than the market value. To that I reply, Certainly not, nor do I find it done. What I protest against is that the landlord should agree to let his house at what I maintain is a full rack-rental, and then endeavour to saddle the tenant with an additional and unjustifiable liability of at least 25 per cent. of such rental. The example mentioned by "H. T. P." proves nothing. Had his property increased instead of depreciated in value, he would of course have had the advantage of the increase, similarly as he now has to submit to the reduction. That, I take it, is one of the penalties of property ownership, but if it would be any consolation to him to know that he is not alone in the boat, I can refer him to a case in which I am now acting for one of the parties concerned, and where a lessee, who holds an unexpired lease of a house at 570*l.* a year, upon which he has spent hundreds of pounds in improvements, being desirous of disposing of it, finds that the best terms upon which he can do so are to assign the lease at a reduced rental of 475*l.* and to pay the superior landlord the difference between that amount and the original rent of 570*l.*

Mr. W. W. Baldwin writes:—My experience of many years in leases and the assessment and settlement of dilapidations suggests to me several points in the relationship between land-

lord and tenant which appear to throw the balance of favour on the side of the tenant, rather than on that of the landlord. Your correspondent seems to have overlooked the facts that—first, the premises are put into complete structural and decorative repair at the commencement of the term; that about 20 per cent. reduction is made on rentals under repairing leases; that short leases are now general; that tenants are yearly becoming more exacting in their requirements, and that landlords are consequently obliged to expend larger sums in decorative and other works. Under these circumstances it cannot be said that, and especially under a short lease, the covenant to paper, paint, decorate, &c., in the last year of term is unreasonable, and I fail to see in it any argument in support of your correspondent's assertions as to "the increasing one-sidedness of the covenants (in leases) in favour of the landlord."

AMERICAN LAW OF ARCHITECTURAL SUPERINTENDENCE.

A SERIES of articles on "Architect, Owner and Builder before the Law" is appearing in the *American Architect*. Among the reports given is the following, in which the law as respects superintendence is more clearly explained than is common in American judgments.

Messrs. Hubert, Pirsson & Co. were architects of a building called the Mount Morris Apartment House in New York for Mr. John W. Aitken. The total cost of construction was 118,000 dols. The action was to enforce a lien for the architects' services. The defendant set up a counterclaim for alleged negligence on the part of the plaintiffs, resulting in defects, omissions and mistakes of contractors and workmen. The case was tried first before a referee, who found for the plaintiffs, for the full amount claimed, and an appeal was taken to the full court.

In announcing the decision of the court Judge Van Hoesen said:—"The learned referee, in answer to the request of the defendant, has found that the sectional area of the boiler-flues" (probably tubes) "for the building was 404 square inches; that the sectional area of the chimney-flue designed to receive the smoke and gases from the boiler-flues was, at its base, where it was entered by the boiler-flue, 272 square inches; that the area provided by the said chimney was inadequate for the service of the said boiler-flues; that by reason of the inadequacy of the said chimney-flue the proper combustion of the coal in said boiler fires could not be secured; that to supply the deficiency of chimney-flue the defendant will necessarily and properly be required to build a new chimney-flue on the outside of said building; and that the necessary cost and expense thereof will be 1,000 dols. But the learned referee was of opinion that the plaintiffs were not liable to the defendant for the expense of supplying the deficiencies of the chimney, because, though architects by profession, they are not experts in steam-heating, and, to use the referee's language, 'all that was required of them was that they should confer with whoever became the contractor for the steam-heating, and ascertain what dimensions were required for the chimney-flue to afford a draught for the heating system. This they did, and Tudor, the contractor for the steam-heating appliances, gave the dimensions. While it is obvious that this chimney was insufficient, the responsibility should rest upon the person who committed the fault.'

"I am unable to agree with the referee in his conclusion. The plaintiffs are architects of standing, who assume to be able to plan and superintend the construction of first-class apartment-houses, to be heated by steam, and to be provided with every convenience demanded by the luxurious tastes of the day. They are not architects in a rural community, but in the first city in America. Steam-heating is, as we all know, common, if not a necessity, in all apartment-houses of large size and of a high class. It is true that houses of this description are of recent introduction, but they are now a very important part of our system of economics, for in some of the new streets they are more numerous than private residences or tenements of the kind that formerly were in vogue. The architect who undertakes to construct a house that is to be heated by steam is groping in the dark unless he knows how large a chimney is required. It is as necessary that the architect should know what is needed to make the steam-heating apparatus serviceable as it is that he should know how sewer-gas is to be kept out of the house.

"No one would contend that at this day an architect could shelter himself behind the plumber, and excuse his ignorance of the ordinary appliances of sanitary ventilation by saying that he was not an expert in the trade of plumbing. He is an expert in carpentry, in cements, in mortar, in the strength of materials, in the art of constructing the walls, the floors, the staircases, the roofs; and is in duty bound to possess reasonable skill and knowledge in all these things; and when, in the progress of civilisation, new conveniences are introduced into our houses, and become, not curious novelties, but the customary means of securing the comfort of the unpretentious citizen, why should not the architect be expected to possess the technical learning respecting them that is exacted of him with respect to other and older branches of his professional studies? It is not asking too much of the man who assumes that he is competent to build a house at a cost of more than 100,000 dols., and to arrange that it shall be heated by steam, to insist that he shall know how to proportion his chimney to the boiler. It is not enough for him to say, 'I asked the steam-fitter,' and then throw the responsibility of any error that may be made upon the employer who engages him, relying upon his skill. Responsibility cannot be shifted in that way. . . . I am of opinion that the defendant should be allowed to deduct from the plaintiffs' demand against him the cost of correcting the defects in the chimney—1,000 dols. I have read the appeal book through with care, but find nothing that warrants us in allowing a further deduction from the judgment."

The case was subsequently reargued. In announcing the decision, which confirmed the former one, the Chief Justice, Larremore, said:—"The point upon which chief stress was laid in the reargument of this appeal was that of the entirety of the contract between the parties. The plaintiffs are architects, who agreed to draw the plans for, and also according to the custom of the profession, supervise the construction of the building referred to in the complaint. It appears that there was one grave fault in said plans, and that there were some quite serious departures from the specifications and from the best workmanship in the erection of said building. The learned counsel for the appellant therefore argues that the architect has not completely performed his contract, and that as said contract was an entire one for professional skill and services, and not a divisible or apportionable one, no recovery can be had, and the complaint should have been dismissed. But a very simple analysis will show that this construction is founded on a misconception. With regard to the plans, it appears that the contract was completely performed. Drawings for the whole building were furnished, and it was actually constructed in accordance therewith. After the building was finished it was discovered that the chimney-flues connecting with the boiler-flues were not large enough for the purpose for which they were designed. These flues were not omitted from the plans; on the contrary, they were set down with the same fulness of detail as the other parts of the building. It cannot therefore be said that the plaintiffs did not entirely perform their contract in this respect. They completely performed it, but they performed it negligently.

"Similar considerations apply to the other branch of the case. The learned counsel would not claim that an architect is bound to spend all his time at a building which is going up under his professional care, so that no fraud or negligence can be committed by any of the contractors. The counsel would not contend that the architect is an insurer of the perfection of the masonwork, the carpenterwork, the plumbing, &c. He is bound only to exercise reasonable care, and to use reasonable powers of observation and detection in the supervision of the structure. When, therefore, it appears that the architect has made frequent visits to the building, and in a general way has performed the duties called for by the custom of his profession, the mere fact, for instance, that inferior bricks have been used in places does not establish, as matter of law, that he has not entirely performed his contract. He might have directed at one of his visits that portions of the plumbingwork be packed in wool. Upon his next return to the building the pipes in question might have been covered with brickwork in the progress of the building. If he had inquired whether the wool-packing had been attended to, and had received an affirmative answer from the plumber and the bricklayer, I am of opinion that his duty as an architect, in the matter of the required protection of said pipes from the weather, would have been ended. Yet, under these very circumstances, the packing might have been intentionally or carelessly omitted in fraud upon the architect and owner, and could it still be claimed that the architect had not fully performed his work? The learned counsel for the appellants is in effect asking us to hold that the defects of the character above named establish, as a matter of law, that the plaintiffs have not fully performed their agreement. An architect is no more a mere overseer or foreman or watchman than he is a guarantor of a flawless building, and the only question that can arise in a case where general performance of duty is shown is, whether, considering all the circumstances and peculiar facts involved, he has or has not been guilty of negligence. This is a question of fact and not of law.

"Upon reconsideration I am more firmly convinced of the correctness of our conclusions reached after the former argument. The defect in the plans which led to the construction of too small a chimney was something for which the plaintiffs, and no one else, could be held responsible. For the reasons so cogently stated in Judge Van Hoesen's opinion, the plaintiffs were, as a matter of law, guilty of negligence in falling into this grave error. In analogy with the rule adopted in ordinary contractors' cases we deducted from the sum due under the contract

the amount of damages caused by such negligence, and directed that the plaintiffs either take judgment for the balance, or suffer an absolute reversal. As to the conceded facts of malconstruction and use of inferior materials, the referee has decided, on sufficient evidence, that the same were not properly attributable to the plaintiffs' negligence, and we can discover no reason for disturbing his findings. The order entered after the former argument must in all respects stand."

In this very recent and important case, the duties of the architect, and the distinction between them and those of the contractor, are laid down with great clearness and precision, and, on the facts as presented, even architects will probably acknowledge that strict justice was done; but, so far as the report indicates, the facts were presented with a singular carelessness of the interest of the plaintiff. The referee's finding, based of course on the evidence offered him by both sides, made it appear that the scientific rule for proportioning boiler-chimneys, which the architects ought to have followed, was to make this area of the chimney-flue equal to the combined area of the boiler-tubes, and, as it was easily proved that the area of the flue was less than that of the tubes, he assumed, and the judges of course followed his conclusion, that the architects had neglected to comply with a scientific rule which they ought to have known and followed. Now, in point of fact, there is no such rule. It is not uncommon for ordinary mechanics, of the sort that the judge contemptuously called "steam-fitters," to use such a proportion, which is easy of application, and gives a flue which, if too large, can be reduced by partly closing the damper; but this practice has no scientific basis whatever. On the contrary, the rules given in the books usually concern themselves only with the ratio between chimney-flue and the grate-surface, without any regard to the area of the boiler-tubes. It is obvious that the amount of coal consumed, and the volume of smoke to be carried off by the chimney, are strictly limited by the grate-surface, and the proper capacity of the chimney is that which, taking into account the proportion of openings to solids in the grate, and the resistance offered to the passage of air by the coal, as well as the height of the chimney and the estimated velocity of the flow through it, will carry off the products of combustion freely.

In many cases, probably, there is an excess of tube-area in the boiler over that required by the grate-surface, so that most of the smoke passes through a portion of the tubes; but the chimney can evidently draw only so much air as the grate-surface supplies, whatever the tube area may be. What the grate-surface in this case may have been no one seems to have inquired, and, although it does not follow that the chimney was really large enough for its purpose, or that the architects may not have been at fault in some other way, the record represents them as having been fined a thousand dollars for having neglected to observe an imaginary rule, which is unknown to science, and has no foundation in reason or authority.

Moreover, the court reproached the architects for having deferred to the judgment of "the steam-fitter" in designing their flue, instead of following the guidance of their own "technical learning." So far as the facts were presented to the court, this point was well taken; but it does not seem to have been anywhere suggested, on behalf of the architects, that Mr. Tudor, far from being a mere "steam-fitter," was one of the most accomplished experts in steam-heating in the United States. If the architects had felt any doubt about the proportioning of their chimneys, or in regard to any other point in the heating of their building, it would have been their duty, in their client's interests, to consult exactly such an expert as Mr. Tudor, and to follow his advice, in preference to their own opinion, and they might justly have been accused of negligence if they had failed to do so; while Mr. Tudor's position as the contractor for the heating apparatus gave his opinion the additional weight to be derived from special familiarity with the problem, and a personal interest in the successful working of the apparatus.

It seems hardly possible to doubt that these considerations would have had a very important influence in modifying the decision of the court if they had been brought to the attention of the referee, and through him to that of the judges, but there is no indication in the report that they were presented at all. On the contrary, the referee thought, although the court did not agree with him, that it was the duty of the architects to "confer with whoever became the contractor for the steam-heating," and that if they did this their duty was fulfilled, no reference whatever being made to Mr. Tudor's exceptional position as an expert of the highest rank.

Another point which seems to have been neglected by the counsel for the architects was the proof of the necessary cost of remedying the deficiency in the size of the chimney, if it really existed. Every architect knows that the insufficiency of a flue, in cases where heating systems are changed, is often remedied by connecting another spare flue, perhaps a ventilating flue, or one intended for stoves, with the boiler, so as to give the boiler two flues instead of one. This arrangement works perfectly well in most cases, and costs only a few dollars; and the architects, even if their negligence were proved, could only be held liable for the cost of the cheapest reasonable method of remedying the defect due to their fault; but no attempt appears to have been made, on behalf of the architects, to devise such a method, and the defendant's estimate of the probable expense of remedying the alleged trouble appears to have been accepted without question.

The whole story shows how extremely technical cases concerning architects usually are, and how difficult it is to have their side properly placed before a court, even in a community so familiar with professional work as New York. In other places, where architects are little employed, the temptation to confuse their functions and responsibility with those of the builder is still strong.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE members of this Association paid a visit to the house erecting in Great Western Road for Mr. A. P. Anderson, and of which Mr. T. L. Watson, F.R.I.B.A., is architect. Among many fine residences it takes a conspicuous place. The style adopted, English Gothic of the sixteenth and seventeenth centuries, causes a marked though not inharmonious contrast with its Classic neighbours. Picturesque grouping and variety of form is obtained by tall chimneys, many gables and timber-work; colour by the red stone of two shades, ornamental brick filling—cement also—of timber quarterings, green slates and tile ridgings and crests. Internally the chief features of interest are the hall and the staircase. The former is a large apartment rising the height of two storeys, with an open timber roof, a gallery of woodwork at one end, space for a large organ, and a fireplace recess with hooded stone chimneypiece. The staircase has stone arcadings, both large and small, enriched with carving and diaperwork. Mr. Wishart, clerk of works, conducted the party and gave all necessary explanations.

VILLAGE SEWERAGE.*

IT appeared to our fathers that the speediest, most natural and most effectual method of disposing of sewage was to pour it into the nearest river or stream, regardless of whether the water, or any quantity of it, was likely to be taken by villagers further down for domestic purposes, and this method, unfortunately, obtains generally throughout the length and breadth of the land. To this state of affairs we have the following objections brought prominently before us:—(1) That it is illegal to pollute streams; (2) that it is antagonistic to public sentiment; (3) that it is injurious to public health. Any one of these objections would cause district committees to hesitate before proposing to execute drainage works which have, as an element, the disposal of filthy liquid into a limpid stream; but if all three objections are established, no such scheme would get beyond the standing joint-committee of a county council. The third objection, if proved, would of course be the most fatal; and in this connection I shall refer to a few expressions of opinion which were made public recently. According to the *Deutsche Bauzeitung* (February 18, 1891), a remarkable investigation was made by Professor Pettenkofer of the river Isar, between Munich and Freising. Observations were made during a time when the river was in flood, and also last winter when it was abnormally low, and, consequently, when the proportion of the fæcal matter, in relation to volume, was greatest. The relative volume was as follows:—At lowest level, 50 cubic mètres per sec.; at mean level, 189 cubic mètres per sec.; at highest level, 359 cubic mètres per sec.

A comparison was made between the amount of oxygen that was required to destroy the organic substances in the water when the river was at its lowest level, and the amount that was required when it was at its highest or in time of flood, and the observations of Professor von Pettenkofer led him to conclude that the water was much freer from pollution when the river was low than when it was in flood. He affirms that he does not think that evil results follow the discharge of raw sewage into the river, retreats from the contrary opinion which he formerly held, and undertakes to prove that bacteriological investigations do not support the theory that harm is done to the river by the discharge of sewage. Munich is a town with 270,000 inhabitants. In reading a paper before the Engineering Section of the London Congress of Hygiene last month, Mr. Baldwin Latham, C.E., said:—"The experience in India in connection with the water supplies taken from rivers shows that the rivers undergo a process of purification, and that the waters taken from them

* A paper by Mr. J. D. Watson, county sanitary inspector of Aberdeenshire, read at the meeting of the Sanitary Association of Scotland.

after a sufficient length of flow and proper filtration, are amongst the most wholesome supplies in the country, as the case of Calcutta fully demonstrates." And yet he adds :—"The running streams of India, to which the natives have access, are polluted from their sources downwards, but, as a rule, the districts supplied from running streams are healthier than those drawing their water supplies from either tanks or wells."

Against these opinions we have evidence from Professor Robinson, C.E. ; Mr. Binnie, chief engineer to the London County Council (who has had considerable experience as a water engineer in India); and also from Professor Frankland, who read at the Congress a valuable paper on "The present state of our knowledge concerning the self-purification of rivers," in which he quoted the experiments of the Rivers Pollution Commission on the Irwell, Mersey, Derwent and Thames, and his own experiments on the Thames and Ouse, to show that all these experiments negative the theory of self-purification as regards dissolved organic matter, although unmistakable improvement is traceable in the case of suspended matter. He also referred to the experiments of Hulwa, on the Oder, near Preslau ; Frank, on the Spree, at Berlin ; and Pransnitz, on the Isar, at Munich. Hulwa supports the theory of self-purification, Frank limits it to suspended matters, and Pransnitz adopts an intermediate view. Dr. Frankland also pointed out that unanimity exists with regard only to self-purification by sedimentation, a process which can never guarantee the absence of danger, inasmuch as a flood is liable at any time to disturb the bed of a stream in such a manner as to raise the microbes which had there obtained a lodgment. He held that of the removal of dissolved organic matter there was no evidence. In the discussion which followed there was very general assent to the views expressed by Dr. Frankland.

It must be admitted that the bulk of the chemical evidence leads to the conclusion that there is real danger in drinking water which has been polluted by sewage, and that the elements of danger are only lessened, not destroyed, by rendering the sewage inappreciable from its uniting with a great body of pure water. But even if it were established beyond question that a water once polluted may be rendered altogether innocuous by natural or artificial means, public opinion is so powerful and frequently so fastidious that it would be difficult to persuade a community to use a water for domestic and dietetic purposes which was well known to be contaminated with foul matters. An eminent analytical chemist (in reporting upon the question of whether it was deleterious to a pure stream to allow a quantity of sewage to flow into it) arrived at the conclusion that the contamination was altogether inappreciable some distance down the stream, and that the water might safely be used for drinking purposes, but, in reporting his conclusion, he described the bed of the stream so minutely at the place of pollution, detailing the appearance of sewage particles, *vorhiellidæ* and *tubifix rivulorum*, in such a manner that the report, instead of having a reassuring effect, created prejudice against the waters of the stream. While I distinctly deprecate supplying a village with the water of a stream which has been contaminated in its upper reaches when it is possible to obtain water from an undefiled source, I attach so much value to the provision of an abundant supply of soft water for dietetic, cleansing and flushing purposes that I should weigh very carefully the chances of danger to health from using water in which an occasional microbe or spore may be found against the certainty of the danger to health from ill-flushed sewers and personal uncleanliness. If it depended altogether upon the question of whether water which had been polluted by sewage can under any circumstances be used as a drinking water, we might not be called upon to deal with the subject immediately, but the law enacts that "every person who causes to fall or flow or knowingly permits to fall or flow or to be carried into any stream any solid or liquid sewage matter shall (subject as in the Act mentioned) be deemed to have committed an offence against this Act." The qualification referred to in the clause (of the Rivers Pollution Act) is to the effect that if the accused shows to the satisfaction of the Court that he has used the best practicable and available "means to render harmless the sewage matter so falling or flowing into the stream" he shall be acquitted. It is quite evident, of course, that both questions are inseparable, inasmuch as a district committee or a county council would hesitate to enforce the provisions of the Act against anyone (more particularly themselves) unless they were satisfied that there were tangible reasons for so doing.

The main question therefore for consideration is, what is the best practicable and available means of rendering harmless sewage matter? In Aberdeenshire we have been for several months deeply interested in the question of the pollution of the river Dee, and by instruction I prepared a report upon the best means of rendering sewage harmless. In that report (a copy of which I lay on the table) I stated at the outset that the conclusions at which one arrives depend almost altogether upon the sources from which his information has been drawn and the experiments that have come under his notice, and that I had therefore deemed it advisable to communicate with a large number of small communities both in England and Scotland, in order to ascertain the exact condition of matters at the present time. Four hundred circular letters were sent out, and 182 were returned with answers to our queries. From the replies which we received 86 were tabulated and printed, and these were selected for the simple reason that the others (96) were for the most part statements to the effect that the sewage of the places to which they referred was allowed to gravitate towards the neighbouring streams without treatment of any kind. The following is a summary of the replies received :—

At fifty places irrigation is adopted in one form or another, and sewage in its crude state is applied to the land. At twenty-four places precipitation is adopted, the following systems being used, viz. Alumino-ferric (4), the "Amines" process (1), Hillë's fluid (1), chloride of lime and iron (1), lime (7), ferozone and polarite (4), Smith's sodium process (2), sewage is said to be treated chemically (4). At six places natural or mechanical subsidence is adopted, and the effluent is thereafter passed into a river or on to a small piece of land. At two places mechanical filtration is adopted. At six places the dry closet system is adopted. At one place cesspools are in vogue.

It should be mentioned that requests were made for replies to our queries only where the town or village was believed to have a population of 20,000 or under. The reason for this restriction was that a town of 100,000 inhabitants might have found a particular manner of treating a large quantity of sewage quite satisfactory when similar treatment would have been quite unsatisfactory in the case of a small town or village ; or, conversely—and perhaps more correctly—a place of 1,000 inhabitants might dispose of its sewage by, say irrigation, when a town of a hundred times that size would find such a course perfectly impracticable. This rule was disregarded only in a few exceptional cases, which I had learned were actually making a profit out of the disposal of their sewage. I therefore made special inquiry, eliciting the information that profit is hardly ever to be thought of in connection with the effectual disposal of drainage water, and where profit has been made it invariably was the result of good "sewage farming."

I beg to notice a few points which occur to me as particularly worthy of attention in the returns which we received, and as bearing directly upon the problem which will present itself to a local authority when it is called upon to take up the subject of river pollution :—

1. It is an important fact that of the 182 replies which we have got, nearly one hundred local authorities do next to nothing to purify the sewage of the town or village they govern. This seems to indicate that neither the Local Government Board in England nor the Board of Supervision in Scotland have been active in causing local authorities to carry out the provisions of the Rivers Pollution Act ; and it may safely be inferred that local authorities have taken action only when the health of the community generally was suffering by the sewage contamination, or when proprietors of the streams affected, or others having *locus standi*, have sued for interdict in the law courts.

2. The decided preference for irrigation, in one form or another, as the most effectual means of disposing of sewage is one of the features of the returns. That this should be so is not surprising to me. Land irrigation is at once the most natural, the best and the cheapest method of disposing of town's sewage, unless, perhaps, when it is largely diluted with chemicals from manufactories, or when land for the purpose cannot readily be obtained.

3. It has to be noted that, in the comparatively few cases where precipitation is recommended, there is a great lack of unanimity in putting forward a particular system. Considering the fact that there have been several scores of patents taken out for purifying and rendering harmless sewage liquid, it is somewhat remarkable that so few of those patent processes are recommended by responsible surveyors and inspectors ; and it is also noteworthy that in no case where a particular chemical or method of precipitation has been recommended is that method of long standing—emphasising the fact that of those methods which have been put into practical operation, a limited number only have attained more than transitory existence ; and these returns again bear out in a remarkable manner the truth of the conclusions to which the Royal Commission on Metropolitan Sewage Discharge (Lord Bramwell's) arrived when they reported that "several processes appear to be fairly effective, but that there has been no evidence to satisfy us of the marked superiority of any one in particular."

4. A summary of the Appendix also shows that land irrigation is a much cheaper operation than precipitation, presuming, of course, that land can be got at a reasonable cost, and that it does not require too much labour to convert it into a fit condition for receiving sewage ; and it should not be forgotten that even clay soil is fit to be used for irrigation if properly prepared. One of the results of the Society of Arts conference on the health and sewage of towns (1876) was expressed by committee as follows :—"In certain localities, when land at a reasonable price can be procured with favour-

able natural gradients, with a soil of suitable quality and in sufficient quantity, a sewage farm, if properly conducted, is apparently the best method of disposing of water-carried sewage. It is essential, however, to bear in mind that a profit should not be looked for by the locality establishing the sewage farm, and only a moderate one by the farmer."

5. That the sludge precipitated is got rid of with difficulty, even where no charge is made for it. When farmers take it away, they do so at times convenient for themselves, and it frequently lies in great heaps for many months of the year. The chemical used for precipitation sometimes destroys the fertilising qualities of the sludge; occasionally, on the contrary, it is said to improve it, but, speaking generally, the sludge is hardly worth more than cartage from the tanks to the farm.

That improvements are likely to be effected upon the present systems of treating sewage by precipitation and filtration is more than probable, but in the present state of knowledge and experience there is little room for hesitating to accept the conclusion that the system of broad irrigation, assisted occasionally by intermittent downward filtration, is the most effectual, the cheapest and most generally suitable for the disposal of the sewage of our villages. It would be impossible to recommend any system which would be equally suitable to all towns and villages, as circumstances vary so much at different places, but when the following conditions obtain there need be little hesitation in adopting broad irrigation :—

1. Where land can be got at a convenient distance from the village.

2. Where the area of ground to be farmed is not less than one acre per 100 of population.

3. Where the ground is of an open or gravelly nature.

4. Where the gradients are suitable, both in respect of natural declivity from the village to the farm, and where the contour of the farm-land readily yields itself to being made an easy slope.

Where all these conditions unite, and the local authority are fortunate enough to obtain a good tenant, I shall expect that the works would more than pay interest on capital outlay. Seeing that it is quite impossible in a paper of limited length to treat the subject in an exhaustive manner, I have endeavoured to refer to those points which ought to impress themselves upon us before we form a judgment which will be subjected to the criticism of a county council and of the public.

THE JUNIOR ENGINEERING SOCIETY.

THE tenth annual general meeting of this flourishing society was held last Friday evening at the Westminster Palace Hotel, Victoria Street, Westminster, Mr. W. J. Tennant occupying the chair. A satisfactory report for the past session was read by the secretary, Mr. Walter T. Dunn, showing an increase in membership of 34 per cent. In consideration of the project for publishing the proceedings of the society and possibly opening a reading-room and museum, it was moved from the chair that the subscription of members over twenty-one years of age be increased. After a long discussion this motion was carried. Afterwards Mr. S. Boulding was elected president. An attractive programme of excursions and other arrangements is in course of preparation for the eleventh session. It is interesting to note that this society, founded ten years ago by half-a-dozen young engineers, has now over 260 members.

MEASUREMENTS OF LONDON BOARD SCHOOLS.

THE Works Committee of the London School Board have had under consideration the following report of the measuring-surveyor of the Board with reference to certain of the duties performed by him :—

As there are two important matters to which I think your attention and that of the committee should be drawn, I shall be glad if you will lay the following before them :—

Firstly, *re* measurements of foundations and drains. I see from the report of the committee on Goodrich Road School, p. 7, last paragraph, "That the measuring-surveyor shall measure the foundations," &c. &c., and on p. 8, first paragraph, "That all questions of drainage shall be similarly examined," &c. &c. Now, this work has been carried out, both in letter and in spirit, according to instructions in all works executed under the supervision of the assistant architect for buildings, but it has not been carried out in works under the assistant architect for repairs. I shall be glad of the committee's instructions as to whether I shall, or shall not, take the measurements of foundations and drains executed under the assistant architect for repairs, as I am now under the impression that the committee and the Board expect that this is being done by me. I need scarcely point out to the committee that it will necessitate additional assistance for that work alone. As it is, the measurement of foundations and drains takes the time, on the average, of considerably more than one man. Sometimes as many as five assistants are engaged on this work at once, having to put aside other work so as not to create an excuse for delay by the contractors.

Secondly, with reference to final reports, it has always to me been an unsatisfactory proceeding, for hitherto it has only been a superficial examination. I now feel that in the minds of the members of the Board there is so much weight attached to these reports that their superficial purport and character should be clearly grasped. Without hammer and chisel and workmen to cut and disfigure a new building, it is impossible to find out what is below the surface. I have not the least desire to shirk the responsibility in this or any other matter which the Board may put upon me; but I think it would be well that, for the purpose of these reports, the committee and the Board should understand there never have been any instructions given for an examination below the surface. In view of the importance attached to these reports, I feel that, for my own protection, I must ask for definite instructions as to the nature and scope of the investigations, and also whether they shall extend to contracts executed under the assistant architect for repairs.

After carefully considering the above statement, the committee have given the following instructions to the measuring surveyor and to the assistant architect for repairs :—"Measurements of drainage works executed under the assistant architect for repairs not to be taken by the measuring surveyor or his staff while the work is in progress, as the depths can be checked from the man-holes; but clerk of works to be instructed to keep a record of the widths and thicknesses of concrete laid under the drains, and also the width of the excavations for the same. Measuring surveyor to take the measurements of the depths of foundations and the thicknesses of concrete for the additions and alterations carried out under the assistant architect for repairs, and notice to be sent by the assistant architect for repairs direct to the measuring surveyor when the excavations have been approved by the former, and are ready for the dimensions to be taken. Measuring surveyor, when making final report, not to be responsible for work which has been covered up, and which cannot be tested without cutting about. No final report to be made upon work executed under the superintendence of the assistant architect for repairs."

GENERAL.

Professor Roger Smith will deliver the opening lecture of the coming session in connection with the classes for the study of architecture, construction and architectural drawing, at the college in Gower Street on Monday evening next, October 5, at 7·30 P.M. The subject will be "New Departures in Architecture."

A Portrait of Sir James King, ex-Lord Provost, painted by Mr. E. A. Walton, A.R.S.A., has been unveiled in the Council Hall of the Glasgow Municipal Buildings.

A Picture by Mr. Alma-Tadema—*Water Pets*—has just been added to the collection in the Wolverhampton Art Gallery.

Mr. Hamo Thorneycroft, R.A., has been asked to execute the proposed memorial statue of the late Lord Granville.

Mr. A. Hessell Tiltman has been successful in the competition for the new Westminster Bridge Road establishment to be erected by the Commissioners of Baths and Washhouses of Lambeth. This is the third consecutive victory of the architect within twelve months in similar competitions.

The Annual Convention of the American Institute of Architects takes place at Boston on the 28th, 29th and 30th of this month.

Mr. J. Harnett Harrisson, president of the Liverpool Architectural Society, will deliver his opening address on Monday, the 5th inst.

Mr. W. C. Lucy has been re-elected president of the Gloucester Science and Art Society.

The Autumn Meeting of the Bristol and Gloucestershire Archæological Society will be held at Gloucester on October 8.

The Plans of Mr. D. M'Millan, of Aberdeen, sent in in competition under the motto "Spero," have been selected by the trustees of the Mackie Academy for their proposed new academy at Stonehaven.

The Marquis of Huntly has been appointed to preside at the next annual Sanitary Congress.

In consequence of the heavy pressure of orders received by the Climax Ventilating Company, of 15 Great George Street, Westminster, S.W., it has been necessary to greatly increase the size of the works; a large number of fresh hands have been employed, and it will now be possible to carry out all contracts with great promptitude. The company have just received instructions for the ventilation of the works and offices of the E.C. Powder Company, near Southfleet, Kent; for the church of St. Mary, Cotherstone; and several other churches and public buildings.

The Architect.

THE WEEK.

On Monday next Mr. Anderson will begin his first course as Professor of Anatomy in the Royal Academy. The demonstrations will commence on November 2. The chemistry lectures of Professor A. H. Church will this year treat of grounds, oils, vehicles and varnishes, pigments, new or little-known pigments, selected and restricted palettes, conservation of pictures and drawings. The first will be delivered on November 23. The course of Mr. J. E. Hodgson, R.A., will begin in January next, and will be devoted to the technique of ancient and modern painters. Mr. Aitchison's course on Saracenic and Turkish architecture will follow. At present the lectures on sculpture remain undetermined.

Through the resignation of Mr. George Wallis, F.S.A., Keeper of the Art Collections in the South Kensington Museum, the services of one of the oldest officials will be lost to the Science and Art Department. He has been senior keeper in the Museum for nearly twenty-eight years, and is therefore entitled to rest on that account alone. In addition, Mr. Wallis has served as art master and in other ways for a further period, and in all can count over forty years of work as an official. In 1841 he was appointed to the School of Design in Somerset House, from thence he passed to the Spitalfields School, and afterwards to the Manchester School. Mr. Wallis aided in the preliminary work of the Exhibition of 1851, and served as superintendent of the British textile division. Afterwards he became head-master of the Birmingham School. He was associated with the Exhibitions of 1862 and 1867. Mr. Wallis prepared several reports, which have been printed. If he wrote an autobiography it would contain much that would be useful hereafter, for Mr. Wallis was not one of the officials who hampered progress in the art schools and elsewhere.

The architects of Sunderland are dissatisfied with the arrangements of the competition for the proposed lunatic asylum. It is intended to limit the competition to architects who have already designed buildings of the class, and as the local architects do not possess the requisite experience, the arrangement is simply a device for excluding them. Fortunately in England there is no great demand for lunatic asylums, and consequently very few architects have been enabled to carry out that class of work. The Sunderland Council, by restricting the competition to them, cannot expect more than a repetition of something that already exists, and it would be almost as wise to send a surveyor to make plans of an asylum which could be carried out by a builder. An open competition would not entail more expense than one between a select few, and there can be no doubt the result would be more advantageous to Sunderland.

Efforts are being made for the recovery of an old Scottish chalice. It appears that early in the present century two old chalices, dated 1638 and 1642, passed into the possession of the late Lord Panmure. For some years great efforts by antiquaries and others have been made to trace the destination of these chalices. The 1642 chalice, bearing the Dundee town-mark, has been discovered in the possession of the rector of Exeter College, Oxford, a drawing of which appears in "Old Scottish Communion Plate." It is with reference to the 1638 chalice that an appeal is made on behalf of several influential antiquaries. A few years ago this chalice was exhibited at a *soirée* in connection with the Society of Antiquaries by Messrs. Lambert & Co., Coventry Street, W. Since then it is supposed to have been sold for some charity. The Messrs. Lambert "regret they are unable to afford the information" which would lead to its discovery. A well known English antiquary, who saw the chalice at the *soirée*, and took a wax impression of its hall-mark, states that it was stamped with the Edinburgh hall-mark, and had engraved on its bowl an inscription to the effect that it was gifted to Monifieth in 1638 by a nobleman, whose name he is unable to recall. It had a large saucer-shaped bowl set on a slender stalk, and weighed, according to a statement in the church records, "16 ounces and one drop." As this chalice forms an important link in the history of the manufacture of Scottish chalices, any information which would lead to its present destination would be of great service to antiquarian research.

The Liverpool City Council on Wednesday authorised the Library Committee to apply the sum of 800*l.*, portion of the profits of the Autumn Exhibition, in the purchase of pictures and works of art for the permanent collection. The committee propose to purchase a bronze statuette, *Peace*, by Mr. Onslow Ford, and the following pictures:—*A Select Committee*, by H. S. Marks, R.A.; *An Idyll*, by M. Greiffenhagen; and *Ronda Fair*, by Mr. A. Melville. Some objection was raised to the expenditure of 800*l.* on the statuette, which was described by one member as having an ungraceful pose, legs of unequal length and a peculiarly ugly face. But the force of criticism has been weakened of late in the Council, and the proposal was carried by twenty-seven votes to seven.

The tunnelling beneath the Mersey for the conduit of the Liverpool Waterworks is a most difficult operation; but as the delay in completing it has retarded the delivery of the water in the city, there is some dissatisfaction. The death of one of the contractors has naturally caused many people to become desponding about the result. Mr. Deacon, the engineer, in his last report admits this, for he says:—"I have reason to believe that the disappointments which have occurred in connection with this tunnel have led to the impression in some minds that its completion is practically impossible. I have consistently urged the contrary, and the experience gained in the progress of the work has increased the confidence I have always felt that it will be satisfactorily carried out." In order to inspire confidence in the operations, Sir Benjamin Baker has been asked to give his opinion on them, and to say whether there is a prospect of their being successfully carried through within a reasonable time, and whether it is advisable for the Corporation to complete the tunnel according to the present plans, or whether any other plans, or a modification of the present ones, had better be adopted. In his report Sir Benjamin Baker states that he approves of the plan adopted by Mr. Deacon, and does not consider many deviations from the course hitherto pursued are necessary.

The volume on "Bungalows and Country Residences," by Mr. R. A. Briggs, published by Mr. Batsford, contains such an ample list of subscribers, it does not need any commendation of ours to insure its success. We may say, however, that these drawings of executed works will be found suggestive by many architects and by people who are thinking about building comfortable and economical houses, but are not determined upon the character of what they desire. By a bungalow, Mr. Briggs does not mean a house for a special locality like those near Margate, to which the title was first applied in England. His definition of a bungalow is "a little country-house, a homely, cosy, little place, with verandahs and balconies, and the plan so arranged as to insure complete comfort with a feeling of rusticity and ease," and the aim of the author is "to show that small houses costing about 700*l.* can be built simply, economically and, I hope it will be thought, artistically." A few of the houses are more costly: one is 2,500*l.*, another 2,200*l.*, and a house for New Zealand was estimated at 4,500*l.* There is a surprising amount of variety in the plates. Mr. Briggs is never afraid to exercise his imagination, and to think for himself. But it must be said he never attempts anything which is out of place in buildings of the class he has in view. Even the bungalow, "in a free Greek style," does not appear inapposite, for the treatment does not recall the small Classic houses of the early part of the century, which seemed to be derived from an ancient mausoleum. The designs are also satisfactory, through the lightness which pervades them, and they all are adapted to make bright and cheerful homes, at prices which compete with commonplace houses of the speculative builder.

LANDOR ON ART.

IT is often said that the art of writing noble prose is lost in England, and some will maintain that the last master was Walter Savage Landor. There are others of a more hopeful turn who hold that if not the last of the race he was at least the finest prose writer of the century—a man who could combine, as Archdeacon Hare says, "the dignity and almost the soaring flight of Milton's prose with the ease and elegance and classicalness of Middleton, and the precision, plain spokenness and downright good English of Swift." Yet while admitting his eminence in literature, it may be doubted whether Landor was not meant by Nature for a different pursuit. The freaks which cost him so much were signs that he was not at ease in a quiet study. He was of a militant disposition, and seemed to take delight in attacking men and things with his pen because a different sort of weapon was not allowed to him. Landor was, no doubt, unjustly treated when a Duke of Beaufort declined to recommend him for the Commission of the Peace, and he found that in other affairs his independence became an obstacle to his utility as a citizen. He was baulked in his ambition, and there was nothing left but to impose exile upon himself and to expend his vigour on literature. He laboured as much in the hope of finding an anodyne in the expression of his thoughts as with the desire to gratify what is called the reading public. He described his efforts when he said, "Never have I done anything to attract the public notice, which is ordinarily attracted not by the slow operation of silent power, but by a rapid and incessant display of peculiarities and freaks in the most public paths of literature."

A man cannot continuously spin ideas, like Wolsey, "spiderlike, out of his self-drawing web." He must turn his attention outwards. Italy, in Landor's time, did not afford much which it was agreeable to contemplate, with the exception of art that was not modern, and accordingly there is much in his writings which denotes that he had overcome many of his insular prejudices about buildings and the pictures and statues which may serve to adorn them. He also became a collector, and the following note of Emerson's gives a pleasing glimpse of Landor as a man of taste about 1833:—

> On the 15th May I dined with Mr. Landor. I found him noble and courteous, living in a cloud of pictures at his Villa Gherardesca, a fine house commanding a beautiful landscape. I had inferred from his books, or magnified from some anecdotes, an impression of Achillean wrath, an untamable petulance. I do not know whether the imputation were just or not, but certainly on this May day his courtesy veiled that haughty mind, and he was the most patient and gentle of hosts. In art he loves the Greeks, and in sculpture them only. He prefers the *Venus* to everything else, and after that *The Head of Alexander*, in the gallery here. He prefers John of Bologna to Michel Angelo; in painting, Raphael; and shares the growing taste for Perugino and the early masters. One room was full of pictures, which he likes to show, especially one piece, standing before which he said "he would give fifty guineas to the man who would swear it was a Domenichino."

In the "Cardinal-Legate Albano and the Picture-Dealers" we have some of Landor's experiences of what had to be gone through for the acquisition of masterpieces in Italy, and of the tricks of which Englishmen especially were the victims. The Italian prelate's observations are marked by much biting sarcasm against our countrymen's connoisseurship, for Landor could rarely forget his grievances when he held a pen. Thus in one place he remarks:—"As the English fight best upon the ocean, it is probable and presumable that they see best with their heads under water, which opinion some of the pictures bought by them on dry land at enormous prices for their National Gallery seem to confirm." In another place it is said:—"If the scourers at Florence go on as they have been going on lately, the collections at the Gallery and at Pitti will be fit only for the Committee of Taste in London." And again:—"There is scarcely an auction, I hear, in England, without a dozen of Domenichinos, while in Italy dukes and princes lie on their deathbeds and gasp for one." Mingled with much that is no less bitter are fragments in which Landor expressed admiration for genius in the most apt words. Here is a sample of many passages which are supposed to be spoken by the Legate:—

> Titian ennobled men; Correggio raised children into angels; Raphael performed the more arduous work of restoring to woman her pristine purity. Perugino was worthy of leading him by the hand. I am not surprised that Rubens is the prime favourite of tulip-fanciers; but give me the clear warm mornings of Correggio, which his large-eyed angels, just in puberty, so enjoy. Give me the glowing afternoons of Titian, his majestic men, his gorgeous women, and (with a prayer to protect my virtue) his Bacchantes. Yet, signors, we may descant on grace and majesty as we will; believe me, there is neither majesty so calm, concentrated, sublime and self-possessed (true attributes of the divine), nor is there grace at one time so human, at another time so superhuman, as in Raphael. He leads us into heaven, but neither in satin robes nor with ruddy faces. He excludes the glare of the light from the sanctuary; but there is an ever-burning lamp, an ever-ascending hymn, and the purified eyes see, as distinctly as is lawful, the divinity of the place. I delight in Titian, I love Correggio, I wonder at the vastness of Michel Angelo; I admire, love, wonder and then fall down before Raphael. Even the colouring of Correggio, so transparent, so pure, so well considered and arranged, is perhaps too rich and luscious for the divine ideas of Raphael; it might have overshot the scope which his temperate suavity attained. Raphael in Rome had forgotten the tenderness of his diviner love, and the tempter had seduced him to change purity for power. Nevertheless he remains, far beyond all comparison, the greatest genius that ever glorified the arts. He was not, like Michel Angelo, a great architect, a scientific sculptor, an admirable poet; he attempted not universality, but he reached perfection. What other mortal has?

In his "Pericles and Aspasia" Landor could easily have displayed his acquaintance with art, but there as elsewhere in his writings he shows his appreciation of measure, and he never becomes pedantic. As the letters are supposed to be mainly written by Aspasia, no more is said than was likely to come before the mind of a lady whose topics were numerous, and who as a Greek would fear to do or say anything that was out of place. But Landor introduces many ingenious speculations in the course of the correspondence. For instance, he suggests, and he was the first to do so, that the shield of Achilles which Homer describes was derived from some Assyrian work, a theory which of late years has gained credit for other men. Pericles is also made to give expression to remarks which are not unworthy of that enlightened citizen-ruler. Here is an imaginary letter apropos of the completion of the Parthenon, which those who have read it the most often will be glad to see again reprinted:—

> The Hecatompedon, which many of the citizens begin to call the Parthenon, is now completed, and waits but for the goddess. A small temple, raised by Cimon in honour of Theseus, is the model. This, until lately, was the only beautiful edifice in the Athenian dominions. Pericles is resolved that Athens shall not only be the mistress, but the admiration of the world, and that her architecture shall, if possible, keep pace with her military and intellectual renown. Our countrymen [Aspasia was an Ionian], who have hitherto been better architects than the people of Attica, think it indecorous and degrading that Ionians, as the Athenians are, should follow the fashions of the Dorians, so inferior a race of mortals. Many grand designs were offered by Ictinos to the approbation and choice of the public. Those which he calls Ionian are the gracefuller. Crateros, a young architect, perhaps to ridicule the finery and extravagance of the Corinthians, exposed to view a gorgeous design of slender columns and top-heavy capitals, such as, if ever carried into execution, would be incapable of resisting the humidity of the sea-breezes, or even the action of the open air, uninfluenced by them. These, however, would not be misplaced as indoor ornaments, particularly in bronze or ivory; and, indeed, small pillars of such a character would be suitable enough to highly-ornamented apartments. I have conversed on the subject with Ictinos, who remarked to me that what we call the Doric column is, in fact, Egyptian, modified to the position and the worship; and that our noblest specimens are but reduced and petty imitations of those ancient and indestructible supporters to the temples of Thebes, of Memphis, and of Tentyra. He smiled at the ridicule cast on the Corinthians by the name designating those floral capitals, but agreed with me that on a smaller scale, in gold or silver, they would serve admirably for the receptacles of wax-lights on solemn festivals. He praised the designs of our Ionian architects, and acknowledged that their pillars alone deserve the appellation of Grecian; but added that in places liable to earthquakes, inundations, or accumulations of sand, the solider column was in its proper situation. The architraves of the Parthenon are chiselled by the scholars of Phidias, who sometimes gave a portion of the design. It is also reported that two of the figures bear the marks of the master's own hand; he leaves it to the conjecture of future ages which they are.

It is hardly necessary to say that, in writing such a passage, literary form rather than technical exactness would be foremost before Landor. There is much else in the "Pericles and Aspasia" which would bear transcription if space were available. But a more elaborate example of his method of treating an architectural subject demands attention. This is the conversation between Landor and his landlord, the Marchese Pallavicini, in which more than one style is noticed. It should be mentioned, however, that

the talk about architecture appears to be intended to give more effect to a subject of a very different sort—an act of barbarity by an English general, and which drew from Landor the famous words, "These two fingers have more power, Marchese, than the Houses of Parliament. A pen! he shall live for it. What with their animadversions can they do like this?"

Pall. I have been in London, and was much surprised at the defects of architecture in your capital. Not only Rome, Genoa, Venice, Verona, Vicenza, Milan, but Paris itself, excels it; and how incomparably more magnificent must have been the public works of Athens!

Lan. Those both of Paris and of London would not constitute a third of the Piræus alone, of which the length exceeded six miles; the height was sixty feet, not reckoning the foundation, and the breadth at top about twelve. It was of square stones, fastened together by cramps of iron and by molten lead.

Pall. Being begun and carried on in the greatest haste, I wonder how the Athenians had leisure for the squaring of stones, each of which weighed several tons.

Lan. This question has never been discussed. In my opinion, those of the greatest bulk were taken from the ancient walls of the city, which not only were useless now its boundaries were quadrupled in extent, but which obstructed the communications and deformed the beauty of the place. These originally were erected by one of those societies of itinerant masons, which, like many colonies, are called Pelasgian. I suspect they were Etrurians—a people more early on the road to civilisation than the inhabitants of Hellas, although they never carried it to the same extent. They, indeed, were the Chinese of Europe.

Pall. Surely you undervalue them.

Lan. Far from it. I was speaking of the ancient: Greece alone, of all the nations on the globe, rivals the modern. But there is no evidence or probability that the arts in old Etruria ever equalled the same in China; where, moreover, the powers of imagination and reflection raise our wonder in their earlier writers. The great wall of China quite obscures the Piræus by its magnitude, unequalled as it is in its utility and beauty, which may be imagined, although faintly, if we recollect that to the main walls of the Piræus were added two others—one four miles long, the other somewhat shorter, each adorned with statues.

Pall. This work, then, exceeded any the Romans themselves have built.

Lan. The Romans did less in their city than in the conquered territories. The greatest of their labours was the wall against the Caledonians; the most solid and majestic was the bridge across the Danube. In theatres they excelled the Athenians; those at Athens were worthy of Pallas and Seneca; those at Rome, of Æschylus and Sophocles. The Romans, in ancient times as in modern, found plenty of materials among the ruins. A band of robbers and outcasts saw on the banks of the Tiber a city so little dilapidated that it served them to inhabit. They repaired the roofs with sedge and rushes, deposited their plunder within the two fortresses dedicated to Saturn and to Janus, grew thrifty and religious with no abatement of enterprise or stint of spoliation, found order more and more necessary, and consented to elect with more regularity and ceremony their captains and arbitrators. . . . No spacious and commodious mansion, no august temple was erected in five hundred years—so uncouth was the genius of the people. The magnificence of Syracuse and of Corinth, the most elegant and splendid cities in Europe, left little impression on the destroyers. Their cups were (as they termed it) of barbaric gold, while their temples and the gods within them were of clay. Captured Veii soon supplied Rome with a large assortment of richer images. Lucullus was the first of the nation who had any idea of amplitude in architecture. . . . Augustus did somewhat in adorning the city, but Augustus was no Pericles. Nero never lost sight of magnificence, and erected a palace before which even the splendours of Pericles fade away. Plutarch, in the "Life of Publicola," tells us that he himself had seen at Athens the columns of Pentelican marble for the temple of the Capitoline Jupiter; that their thickness was reduced at Rome, to the injury of the proportions; after which he informs us that the gilding of the whole edifice cost 12,000 talents. Now, the hall in the palace of Nero was as large as this temple; the ground on which it stood was thirtyfold the extent, and the gilding so general that it was called the Golden House. At the decease of Nero the masters of the world trembled to enter it; removed from it the works of Phidias and Praxiteles, of Scopas and Lysippus, of Zeuxis and Apelles, of which probably all that were extant were assembled here; poured forth the lava of the precious metal from its ceilings, its architraves and its arches, and constructed out of its kitchens and stables a bath and amphitheatre for the whole Roman people.

Pall. Nero seems to have pacified them surprisingly, after burning down their houses.

Lan. The conflagration I believe to have arisen from the necessity of purifying the city after an endemical disease, and of leaving no narrow streets in the centre for its recurrence. The extreme love which the populace bore toward Nero long after his death is a proof that they did not attribute to him cruelty or caprice; and they were abundantly recompensed by his liberality. Nothing was left for the Flavian dynasty but to demolish and reconstruct; nothing for Trajan but to register on marble his rapid victories, leaving his virtues to be inscribed on materials more perishable; nothing for Hadrian but to imitate the finer works of the Athenians' architecture then sank for ages.

Landor very often made it a rule to point the moral of his conversations by applying what was said by the speakers to some defect of his countrymen. The discussion of Roman greatness seems to be no more than a prelude to an attack on the English architecture of that day. Although Landor was as enthusiastic a lover of ancient literature as was to be found in England, he was as indisposed as any University Professor of Greek to suffer an abatement of his comfort out of reverence for antiquity. The following suggests one side of Landor's character:—

Pall. With St. Paul's and St. Stephen's before you, cottages are built like castles, and palaces like cottages; and where the edifice is plain and simple the window is a hole knocked in the wall, looking like an eye without an eyebrow or eyelashes, or else it is situated in the midst of an arch, as if a ruin had been patched up to receive it.

Lan. This idea we borrowed from Florence, and very lately. The Florentines turned their shops into palaces when they turned the name of silk merchants into that of marquis, and the patchwork is equally visible in the house and in the master.

Pall. Since I was in England I understand that absurdities even more ludicrous are come into fashion, and that your architects fall back again on what they denominate the Elizabethan style. In fact, condemned by nature to perennial twilight, you wainscot your apartments with the darkest oak, and empanel it in your ceilings; your windows are divided and traversed by thick stonework, and the panes of glass, extremely small, are sometimes made darker by green and purple, and are held together by almost an equal quantity of lead.

Lan. True enough; and when we attempt to be more Classical we run into as gross absurdities. Some of us would be Grecian in our houses, forgetting that the Greeks made a wide difference between the construction of a house and of a temple. Even if they had not, still the climates of the two countries are so different, that what would be convenient on the shores of the Ægean Sea would be ill-placed on the shores of the British Channel. Exposed to our biting winds, the Corinthian acanthus would soon shed its beautiful foliage. And what, indeed, have we to do with the ram's skull and horns belonging to the Ionian?—we, who slay no rams for sacrifice, and to whom, therefore, such a decoration is without a memorial and without a meaning. But Ionian pilasters are admissible to the fronts of our houses, and Ionian columns to our public edifices. However, the ornaments of the capitals should be taken from what is indigenous and appropriate. The portals in England are despicably poor; whereas to these is greatly owing the dignity of the exterior, and the dignity of the interior to the staircase. In this, likewise, the best houses of London, with very few exceptions, are deficient.

Pall. We Genoese are proud of our doorways.

Lan. They are magnificent; so are many in Rome and some in Milan. We have none in London and few in the country, where however the staircases are better. These are usually oak. I inherit an old ruinous house containing one, up which the tenant rode his horse to stable him.

After reading such judgments as the foregoing, which are not marked by any misgiving of infallibility, one is sometimes tempted to believe that Harold Skimpole was not far out when he described Squire Boythorn, that is Walter Landor, as "an amiable bull who is determined to make every colour scarlet." The red rags that Landor tossed about in his fury were numberless, but at least they enabled him to display his agility and power.

THE RIVER, FROM THE CUSTOM HOUSE TO RICHMOND; OR, A CHAT ABOUT SOME BRIDGES.

[By a Correspondent.]

THOUGH, since the rise of the great profession of civil engineers, the building of bridges, except on the smallest scale, has passed out of the hands of the architect, yet the members of that noble calling are undoubtedly better judges, from an artistic point of view, of the design of modern bridges than those gentlemen in whose offices all the drawings were prepared. The writer proposes in the following remarks to put down the result of his own observations, made on the spot, leaving out of the question such criticisms as may be found on the older bridges in some of our standard architectural books.

In this country the writer is not aware of any example on a large scale of Mediæval bridges like that at Prague and many other places on the Continent, though there still remain a few specimens of ancient bridges with chapels or oratories attached to them. The fact is that it has never been so necessary in England to have them, owing to our rivers not being of the great width and length of many in Europe. The difficulties of getting across the streams have not been great, and neither the Thames nor the Severn, therefore, boasts of any noteworthy specimen of a bridge built in the Middle Ages. Great Britain is but a small

island, and in her mountains, rivers, lakes, bays, &c., she cannot pretend to rival Europe. As in her natural features, so it is with the scale of her cathedrals and churches, though this is much more evident abroad in the matter of height than in other respects.

There is a charm about the Mediæval bridges of England that no modern examples possess. For there is in them an absence of straining after architectural effect. They are very simple, made fit to do their work, and look all the better for this. What does a bridge want with extraneous or overlaid ornamentation when it has to bear the brunt of swollen streams and floods, or the assaults of broken ice? Take such an example as the well-known bridge at Llangollen, with its cutwater piers. Though, owing to the exigencies of traffic, it had not long since to be widened, the ancient "elevation" still remains. In perspective effect, any bridge that is increased in width loses, owing to the piers and arches being thicker and the proportions thus altered. This has always been the great objection to a plan often advocated, through want of thought, in respect to Rennie's great work, London Bridge.

The Tower Bridge will be more after the style of the continental examples, with its noble towers, which will clothe eventually the ungainly skeleton of ironwork to be seen at the present time as one steams down the river. The writer was at first disposed to say, "What a sham!" remembering the published views of this great bridge as it is to be. But it is more charitable to believe that the huge "bascules," or central opening parts of the bridge, must have to do with this ponderous mass of ironwork within these eventually beautiful towers, as well as to provide lifts to convey foot-passengers up to the high-level "crossing" when the carriage-traffic underneath is interrupted.

To dilate upon the confessedly successful design of London Bridge would be to waste the time of the readers of *The Architect*, for have not its praises been sounded far and wide for many a day? Let us, therefore, hurry on elsewhere. Those who live in London, within convenient distance of the great river Thames, ought to be thankful for the privilege of watching its ebbing and flowing tide, ceaselessly alive, with the uninterrupted current of air coming up from the open sea right through the main part of the huge city. People pass hurriedly backwards and forwards over the bridges on their various errands, and, unless they cast their eyes to the nearest adjoining bridge, do not notice the design, all being under them. Those who pass beneath the bridges by the steamboats do so quickly also, because they cannot help it, and do not observe the bridges owing to the other distractions. In a bridge of simple design, where the piers do not abound in lines parallel or continuous with the curve of the bridge, one does not notice the absence of a right angle between the vertical and other lines. For example, in the case of London Bridge and elsewhere, each of the rustications to the piers is very slightly wedge-shaped, in order to get over what might otherwise offend the eye. But in the new bridge at Battersea, as will be commented upon later, the effect, owing to a different treatment, is by no means satisfactory.

Southwark Bridge belongs to the comparatively new era of such structures, where cast-iron began to play a conspicuous part, and plain as it is, with seemingly little design, it is really much more effective than recent "ornamental" examples. The spandrils of the iron arches are open, with reticulations or latticework, the dividing line between the upper and lower reticulations being curved. The piers are quite plain, and the junction between these grey granite abutments and the iron portions of the bridge is a little abrupt here, as in other examples. It is difficult, indeed, to see how this can be avoided. The rise of the bridge in the centre is just sufficient to be graceful. In the new bridge of the London, Chatham and Dover Railway, next to Southwark Bridge as one proceeds up the Thames, there appears to be a mild reflex of the latter, but of course without the gentle arched outline on the top; the piers are unobtrusive, and the open latticework in the spandrils very well treated to suit the material employed. Probably few think of looking at the under side of the iron bridges, as this can only be done from a steamboat or other craft. It is in those where iron plays an important constructional part that the soffite, with its series of arched ribs, braces and stiffening latticework between, has a picturesque effect, as the perspective varies while the steamer moves on. In all the granite bridges the soffite of the arches is an unbroken line. It would no doubt be quite practicable to have ribs to vary the monotony, and thus form a kind of panelling, such as is often employed in chancel and tower arches to churches of the later Perpendicular period. But this would to some extent be *appliqué*, whereas the iron construction just commented upon is not so.

The writer has missed out the South-Eastern Railway Bridge at Cannon Street, as it is really difficult to regard either this or the older Chatham and Dover Bridge at Blackfriars, or the Charing Cross Bridge, as having any architectural pretensions, properly so called. The harsh contrast between the long horizontal lines of the permanent way and the vertical lines of the piers in the first-named example is not pleasing, and the series of unnecessarily heavy cantilevers under the parapet is cumbrous.

The older railway bridge at Blackfriars is so utterly crushed out by its sister bridge on the down-stream side on the one hand and the road bridge on the other, that it escapes much criticism now, though the writer well remembers when he could *see* it. The spandrils are pierced, but instead of the latticework being lozenge-shaped, as in most of the other Thames bridges, it is oblong, the height of the panels being greater than the breadth thereof. It is little use raking up old sores; but can one fancy anywhere else than in this "free country" how the railway interest could thus utterly ignore the effect produced on the "silent highway" and its surroundings by this massing-up of encumbrances to the flow of the river, as well as to the good appearance of the Thames? Even when looked at from the west side, the long line of the railway bridge close behind is unsightly.

At the time the new bridge at Blackfriars was built it met with a great deal of adverse criticism, as will be recollected. Here, as in the other structures where the iron arch plays a part, the junction between it and the granite seems abrupt. The spandrils with latticework, having circular bosses at the intersections, do not really look as well as the simpler latticework in the Grosvenor Railway Bridge higher up the river, by far the best in the writer's opinion, because it is not fussy and overdone. In the same way bosses in slighter relief occur in the arches of iron at intersections. What a parade is made of the great piers at the Blackfriars example, projecting so considerably beyond the bridge in order to provide resting-places for travellers! The huge scale of the capitals and bases to the piers of necessity takes off the real size of the abutments, and, considering these capitals are *appliqué* to some extent, and do not absolutely support the superstructure of the bridge, the only work they do is to carry the light perforated balustrade. What a flourish of trumpets about the sculpture that was to adorn this bridge, which is still "conspicuous by its absence!"

The graceful, pleasing outline of Waterloo Bridge is welcome as a rest to the eyes after the series of modernisms passed since London Bridge was left behind, though Southwark Bridge should be excepted from this category. The rise in the centre is just sufficient, æsthetically, and almost imperceptible. The two columns to each pier, set a little distance apart and in due scale, are much more effective than the huge and would-be ornamental ones at Blackfriars Bridge. It is, too, a great advantage to be able to see both these structures from one point of view—*i.e.* nothing being between them. What an immense difference, though Mrs. Malaprop has remarked that "comparisons are odorous!" In the case of Waterloo Bridge, the contrast between the generally open balustrades and the plain solid parapet over the piers is very happy. No more need be said about this well-known feature except to remark that the introduction of iron has been disastrous in an artistic way for bridge-building, except those on the suspension principle, where one would imagine, from the very nature of the thing, it was impossible to build anything ugly. Alas! alas! Recent history proves the contrary, as will be touched upon later. The old Hungerford Bridge, an early example of the suspension construction, was really a pleasing object, and equally so in its changed quarters over the rocky gorge of the Avon, instead of its lower level over the Thames. About the structure which has taken its place one cannot say much. It does its work, which is

something, but to those who, like the writer, are old enough to remember its predecessor, "the old ways are the best." The fact is, the whole neighbourhood between the river and Charing Cross has been damaged, as regards picturesqueness, by first the removal of Hungerford Bridge, and then by the destruction of the quaint Northumberland House. The street of palaces in the Avenue here by no means compensates the lover of the old things for what has been lost.

And now to Westminster Bridge, the elegant structure of which so much was made at the time it was built. The primary fault in this design is undoubtedly its being based on stone construction instead of iron. There is here likewise that sharp, unsatisfactory-looking line of demarcation between the granite piers and the ironwork which has been remarked upon before.

(*To be continued.*)

THE PRE-RAPHAELITE SCHOOL.

AT the private view of the pre-Raphaelite exhibition in Birmingham on Friday, the 2nd inst., Mr. William Morris delivered an address in the long room of the Art Gallery in reference to the rise and purpose of the school of painters of which the exhibition about to be opened was illustrative.

Mr. Morris said that he proposed to speak mainly on the school of painters who were called "The pre-Raphaelite Brotherhood." There was all the more reason for his doing so because their principal doctrines and tenets had been successful—had impressed themselves upon the present generation of English people, and he thought to a certain extent also on the artists of France. The pre-Raphaelites were a very small body of men. The three leading names were those of Dante Gabriel Rossetti, Everett Millais and Holman Hunt, and to these were added various others, some of whom belonged to the school, although he did not think they were enrolled in the brotherhood. The most noteworthy of the painters of those who were not thus enrolled was Ford Madox Brown. They were not only few, but young. They had to make themselves all the reputation they attained to, and they began with what might be really characterised as a very audacious attempt. Their attempt was a definite revolt against the academical art which, in the main, brooded over all the schools of civilised Europe; and this revolt might be considered as a phase of that great general revolt against academicism in literature as well as in the arts. In literature the revolt had taken place very much earlier. There were many reasons for that priority of time, of which the principal seemed to him to be that the art of painting, being so much more technical than literature, depended much more upon tradition than ever literature did; and that tradition, however poor it might be, however much it might have fallen from its high estate, had very great power to keep people from changing. In literature, therefore, a revolt was sooner made, and its effects were plainer to be seen. It was about the year 1848 that the general first appearance of the pre-Raphaelites was made before the public. The special and particular doctrine they inculcated was that of naturalism. That doctrine at first sight seemed to contain a self-evident proposition. But it meant a great deal when laid down as against the rather worn-out tradition which dominated the whole of the artistic schools of Europe. He remembered distinctly that as a boy, when he had pictures offered to him, he could not understand what they were about. He said to himself, "I suppose that has got the sort of thing in it which ought to be in a picture. There is nothing to be said against it, no doubt"; but plainly he took little interest in it, and he supposed that that was the case with nine hundred and ninety-nine of every thousand of people who had not received definite technical instruction in the art of painting. Even up to the present day the greater number of what he should call laymen in these matters did not feel any very great exaltation when they first saw an old master. The pre-Raphaelites, on the other hand, were perfectly naturalistic, and one would have thought that the public would receive their attempts with acclamation—would say, "Well, here at least is something we can understand. Here are visible sheep, such as we see every day." Strange to say, the public did exactly the reverse. They said, "Why, these things are not like nature." They did not mean that; they meant to say, "They are not like pictures"—which they were not, as pictures then were.

There was, however, one man at least who, although he had been brought up in what might be called—not in contempt, but for the sake of definition—the old-fashioned drawing-master school, and although his master was Mr. J. D. Harding, looked at these pre-Raphaelite paintings with open eyes. That man was John Ruskin, and he became immediately their champion before the public. No doubt they needed such a champion very badly. However, they made way, and finally won great personal reputation, and achieved success, he thought, as a school. But it was necessary to know a little more of what was the meaning of the word "naturalism." He could conceive a certain kind of naturalism which could not be very interesting. There was a good deal of talk nowadays about such naturalism as that which amounted to very little more than a bare statement of fact by means of the art of painting. Pictures painted with that end in view were scarcely works of art, but rather something on the border-line between works of art and scientific statements. The pre-Raphaelite pictures were not in the least like that. They aimed at the conscientious presentment of incident. The brotherhood came to the conclusion not only that they should paint well, but that this good painting—the excellent execution, the keen insight, the careful skill—should be an instrument for telling some kind of story to the beholder. No doubt, in the early days of pre-Raphaelitism, it was rather the fashion to decry any sort of convention. That was a reaction from the tyranny of the weak and unworthy convention against which they had raised the standard of rebellion. But every work of art, whether imitative or suggestive, must be founded on some convention or other. The real point was that that convention should not be, so to say, a conventional convention—should be a convention you had found out for yourself, whether by deducing from history or whether by contemplating nature.

But the pre-Raphaelites went even further than the mere presentment of incidents: they conscientiously considered the due and proper incidents that were necessary in order to make a work of art. Perhaps this third side of their doctrines was less considered by the public, was much more difficult to put before the public than the other two sides. Of the original artists of the school Dante Gabriel Rossetti was the one who had this side most before his eyes—the side, namely, of ornament. No picture was thought to be complete unless it had definite, harmonious, regulated, conscious beauty. It ought to be ornamental. It ought to be part of a beautiful whole, in a room or a hall, or what not. He had some hesitation in speaking about their townsman Mr. Burne-Jones, because he was an intimate friend of that last great ally of the school; but the truth must be told that the man who added this absolutely necessary element of perfect ornamentation was Burne-Jones, and that only when he came to the aid of the school did it become fully apparent that pre-Raphaelitism was a continuation of the art that had been current throughout Europe when Raphael began to be put forward as the great master of the Renaissance. Something might now be said of the individual members of the school. He should say that of the pure naturalism of the school, not thinking so much about tale-telling as about the presentment of natural form, Millais was the leading representative. Dante Gabriel Rossetti, Holman Hunt and Ford Madox Brown were all of them equally concerned with the conscientious representation of incident. In looking at their pictures it would be seen that they always tried to knock the nail in very hard, that there was something going on, something being done, in the picture. At their best they were successful in doing what every great artist tried to do, in really convincing the beholder that the event he represented could have happened in no other way than that in which he represented it to have happened. That in point of fact was the thing aimed at in all the art which might be called dramatic art—or perhaps epical art would be the better word. Then, again, as he had said, Rossetti and Burne-Jones were those representatives of the school who had leaned most towards the ornamental side of art. Burne-Jones especially had really brought the ornamental interest of his art about as far as the thing could go. Both Rossetti and Burne-Jones had very little to do with representing the scenes of ordinary modern life as those scenes occurred before our eyes.

One often heard this brought against artists of that school as a shortcoming. It was a shortcoming. But was the shortcoming due to the individual artist or to the public at large? An artist in representing a modern event must do something to qualify or soften the ugliness and sordidness of the surroundings of life in our day. That was the case not only with pictures, but in literature. Mr. Hardy and others, who were supposed to represent modern life in their novels, took care to surround their modern scenes with an atmosphere of out-of-the-way country life. One never met in the country heroes and heroines like those which Mr. Hardy described. In painting, indeed, one could not get quite so far away from the facts as they could in literature. By all means, if anyone really felt moved to treat modern life, let him do so in the best way he possibly could; but he had not the right in the circumstances, considering the evasions he was absolutely bound to make, to blame his brother-artists who felt compelled to turn back to the life of past times, or rather whose imagination must have some garb, and perhaps naturally took the garb of some period at which the surroundings of life were not ugly but beautiful. The principles of the pre-Raphaelite school, so far as they inculcated pure naturalism,

had more or less succeeded. So far as they went towards the representation of incident—on their epical side—they had not succeeded so well, perhaps, because, after all, for the production of works of that kind were required either people of stupendous genius, of whom very few could be born in one epoch, or a great homogeneous school of tradition which was able to use up all the various qualities of the lesser men, and combine them in one harmonious whole.

For a similar reason the side of the school which tended towards ornament had made less impression still upon the age. That could not be wondered at because, after all, what was all the ornamental side of art but a part of architecture, and architecture could not flourish, could not be an art in a satisfactory sense, unless it were the spontaneous expression of the pleasure and will of the whole people. In our present chaotic condition art could not be got out of the combined efforts of the people at large; it must be simply the work and the expression of individual ideas and individual capacity working towards a certain end. That was one reason why these galleries with their pictures were so interesting. But galleries and museums and the like were not of the slightest use to a population that had not some idea of art before it went into the gallery or museum. You cannot educate a man who does not desire to be educated. Surely the desire must exist, if not universally, or even very widely. Yet it did exist in some degree or another, and granted that the desire existed, then all places like that museum, and especially picture galleries—if the pictures were only sufficiently well chosen—might be of the very greatest possible advantage to those people who wanted to put themselves more or less in the ranks with the great artists of past and present times. They must feed the love of art by showing works which were not only acknowledged to be great works, but which they could at once feel to be so. People sometimes talked as though "the man in the street" were the proper person to apply to for a judgment on works of art. But, as a matter of fact, "the man in the street," instead of being unsophisticated, was sophisticated through and through with the rags and dross of the arts that were current. In music the "unsophisticated" person usually took up not the finest works of art, but the ordinary, feeblest, banal tunes which were dinned into his ears at every street corner; and so it was in the plastic arts.

In conclusion, he commended to young artists the leaders of the pre-Raphaelite movement as an example of patience and diligence and courage, and, in fact, of most of the qualities that went to make great men. He warned young artists against stopping at copying the mannerisms of a great master instead of allowing the example of the master to gradually lead them to do something definite for the world on their own account. He invited all to continue to study the great masters of this and of all schools, not from a conventional point of view. He did not say that one should merely admire a picture because it bore some great name, whether one liked it or not, but let each distinctly say whether he liked it or not. If one could not like it, he did not say let him not be ashamed of not being able to like it, but let him acknowledge, to himself at all events, that his education was not quite complete on the matter of the arts, and try to make it so.

TESSERÆ.

Lincoln Cathedral.

NO English cathedral is externally so imposing as that of Lincoln, and nearly the whole of its sublime architecture belongs virtually to the thirteenth century, though in actual date it begins a few years earlier and ends a few years later. It is the custom to speak of Salisbury as the great typical example of the Early English style, and its unity and completeness may warrant the claim; but, both for the grandeur of the whole and the artistic beauty of every part, and also as a complete exponent of English architecture throughout the whole duration of its greatest period, Lincoln far surpasses it. Its leading features form a perfect illustration, and that on the grandest scale, of the entire history of our architecture from the last years of the twelfth to the earlier part of the fourteenth century. The Pointed style commences with the choir, the smaller transept and the chapter-house, all of which seem to have been erected before the year 1200 by Bishop Hugh. It is commonly stated that his architect was a Frenchman from Blois; and M. Lassus broadly states that he reproduced at Lincoln, in 1188, the design of a church commenced at Blois in 1138. The assertion carries with it its own refutation; for, in an age of restless progress, is it likely that they would take the trouble to bring over a foreign architect of so retrograde a taste as to ignore the artistic progress made in his own country during half a century? In fact, the wonder of the work is being so much in advance of its age, and that advance is not in a French but an English direction. The church of St. Nicholas, at Blois, is in the Early Pointed style of the latter half of the twelfth century, but bears not the least resemblance to this—it is of the same character which is usual in French transitional works, and its carving is strictly Byzantine, not a trace of which is to be observed at Lincoln. If then a French architect was engaged here, he must not only have made over the details of his work wholly to Englishmen, but have studiously followed English forms in the general features. The rebuilding of the cathedral seems to have been followed on systematically westward by the two successors of Bishop Hugh, till the completion of the nave by Bishop Grostete, about 1240. The nave is by far the finest portion of the work as then completed, and is probably in the whole the grandest example of the Early Pointed style in this country. It exhibits the Early English style in its highest state of development, massive without heaviness, rich in detail without exuberance, its parts symmetrically proportioned and carefully studied throughout, the foliated carving bold and effective—there seems no deficiency in any way to deteriorate from its merits. The west end is unique, being a vast and almost unperforated wall covered over with range upon range of decorative arcading, flanked by two vast stair turrets, and backed by two noble towers, the completion of which was, however, delayed until a much later period. The beautiful chapels to the right and left on entering from the west, with their light and elegant columns contrasting most agreeably with the massive piers of the nave merit attention; also the noble rose window in the north transept, perhaps the finest in England. The most gorgeous part, however, of the cathedral is its eastern portion. This was added between the years 1256 and 1282, and is consequently a little later than Henry III.'s work at Westminster. It agrees with it in style, but carries out the principle of window tracery on a far grander scale. It is, in fact, the most splendid work of that period which we possess, and, did it not lack internal height, it could be hardly exceeded in beauty by any existing church. The sculpture with which it was once profusely enriched was of a very high order, the foliated carving perfectly exquisite, the mouldings and other details of the most perfect character. The east window is probably the finest in the kingdom, as is the east front in general, after allowing a certain abatement for the error of having false gables to the aisles. The student of Mediæval art ought to make a long sojourn at Lincoln, and study its treasury of art at his leisure.

The Kilsby Tunnel.

The Kilsby Tunnel, on the London and North-Western Railway, is about 2,423 yards long, and was intended at first to be formed 18 inches thick in the brickwork; but it was found necessary to increase this, in most cases, to 27 inches. The whole has been built in either Roman or metallic cement. The works were commenced in June 1835; but such serious difficulties were met with, at an early stage of the proceedings, that the contract was given up in March 1836, and nearly the whole work had to be performed by the company. Previous to the commencement of the works trial shafts were sunk in several parts of the line of the tunnel, in order that the nature of the ground through which it would have to pass might be ascertained, and it was found to be generally lias shale, with a few beds of rock—in some places dry, in others containing a considerable quantity of water. In sinking the second working-shaft it was found that a bed of sand and gravel, containing a great quantity of water, lay over part of the tunnel, and this was such a perfect quicksand that it was impossible to sink through it in the ordinary way. By repeated borings, in various directions near this part of the tunnel, the sand was discovered to be very extensive and to be in shape like a flat-bottomed basin, cropping out on one side of the hill. The trial shafts had accidentally been sunk on each side of this basin, so that it had entirely escaped notice until the sinking of the working shaft. Mr. Stephenson, the engineer, was led to suppose that the water might be pumped out, and that under the water thus drained the tunnel might be formed with comparative facility; this proved to be the case. Engines for pumping were erected, and shafts sunk a little distance out of the line of the tunnel. The pumping was continued nearly nine months before the sand was sufficiently dry to admit of tunnelling, and during a considerable portion of that time the water pumped out was 2,000 gallons per minute. The quicksand extended over about 450 yards of the length of the tunnel, and its bottom dipped to about 6 feet below the arch. In May 1836, one of the large ventilating shafts was commenced, and completed in about twelve months. This shaft is 60 feet in diameter and 132 feet deep, the walls are perpendicular and 3 feet thick throughout, the bricks being laid in Roman cement. The second ventilating shaft is not so deep by 30 feet. These immense shafts were all built from the top downwards, by excavating for small portions of the wall at a time, from 6 to 12 feet in length and 10 feet deep. In November 1836, a large quantity of water burst suddenly into the tunnel, in a part where there were no pumps; it rose very rapidly, and in order to prevent the ground being loosened by it at the far end, where it was excavated, a rather novel mode of building the brickwork was resorted to.

This was by forming a large raft, and on this the men and their materials were floated into the tunnel, and with considerable difficulty and danger performed their task. All the difficulties were at last conquered, and the tunnel finished in October 1838; but, of course, the expenses were increased to a very great extent. The directors felt it to be their duty not to restrict the proper outlay of capital, when satisfied it would secure the convenience of the public, the stability of the works and the efficient management of the traffic; and they felt persuaded that a perseverance in this course, to the completion of the undertaking, would be found most economical in the end and best calculated to insure the permanency of that successful result which is now happily placed beyond the reach of doubt. The contract for making the Kilsby Tunnel was 99,000*l.*, and it has cost more than 300,000*l.*, or upwards of 130*l.* per yard. There were 30,000,000 bricks used in it, which, at ten hours for a working day, if a man counted fifty in a minute, would take 1,000 days to get through them all. There were above 1,000,000 bricks employed in the deepest ventilating shaft, and its weight is 4,034 tons. The weight of the whole tunnel is 118,620 tons, or it would freight 400 ordinary merchant ships of about 300 tons each, and if these bricks were laid end to end they would reach 4,260 miles. The quantity of soil taken from the tunnel was 177,452 cubic yards.

Metals used in Ancient Sculpture.

A statue of Venus is spoken of as composed of adamant, and attracting a mass of iron. Aurichalcum, or orichalcum, was an alloy of copper and gold, esteemed for its brilliancy and hardness. To prevent bronze from changing, and to give it a good colour, it was rubbed with the amurca of olive, or with bitumen. The ancients, who executed an immense quantity of statues and works in bronze, made a great variety in their alloys. The brass, bronze or copper most celebrated were those of Cyprus (Kupros), from which is derived the name of copper; of Corinth, the alloy of which is attributed to chance, to the melting and mixture of several metals during the burning of that city; but it appears that this is hardly possible, and that the bronze is more ancient. In the time of Pliny it was imitated with an alloy of copper, gold and silver; that of Delos and of Egina was much esteemed, as well as that of Tartessus in Betica. Polycletes preferred the bronze of Delos, and Myro that of Egina. The different kinds of copper, of Cordova or of Marius, of Sallust, found in the Alps, and of Livy, mined in Gaul, were much sought after, and derived their names from the proprietors of the mines who worked them in the time of Cæsar. There was also a black bronze, and also that which, being of a liver colour, was called hepatizon, from hepar, a liver. It was believed for a long while that the ancients dipped bronze in water to harden the arms which were made of it; but M. d'Arcet has proved that tempering softens bronze, and that it is only by alloying copper with tin in certain proportions, and by forging it, that it acquires hardness and elasticity, and becomes sonorous. Electrum, which is mentioned in Homer, was either natural or artificial. It was made by mixing a fifth of silver with four-fifths of gold. This alloy was much esteemed, because it was found to shine more with lights than either gold or silver. Pliny says that vases made of it assumed the colour of the iris or rainbow. The name of electrum was also given to yellow amber. Several statues of iron are mentioned, both wrought and cast. The statue of Mammurius, who made the ancillæ or sacred bucklers in the time of Numa, was of lead. Obrizum was the purest gold, which, after having passed several times through the fire, acquired a brighter colour. Some statues were made of massive gold, but in general they were embossed (called sphurelaton) from a thin plate. Gold was thus used in statues where it was joined to ivory; and often statues in metal or wood were only plated or gilt. Gold of several colours was used, and sometimes also painted ornaments or precious stones were used in conjunction with it. Silver is frequently mentioned by authors as a material for statues; it is, however, less adapted for sculpture, and was less used than gold, of which several preparations were known. Tin is enumerated by Homer among the metals in the shield of Achilles; but it is more than doubtful whether this description and others relating to the arts were written by the great poet.

Timber Roofs.

In 1561 Philip De Lorme published a method of constructing roofs and domes with timbers, or rather short planks. One of these roofs covered the stables of the Tuileries, and after remaining sound and secure for 234 years was demolished to make way for some improvements in the palace. The arches were formed of two planks, 9 inches in width, cut into convenient lengths for the required form. This seldom exceeded 4 feet, and were applied to each other in thicknesses to form the rib, and so laid that the ends of one set came in the middle of the others. Mortises were then made in them, through which were longitudinal ties, and these had a small wooden pin passed through them on each side of the circular ribs to keep them in their upright position and to prevent them twisting. In some of the buildings executed by this architect, when the span of the roof exceeded 60 or 70 feet, two ribs were used so put together that they partook of the character of hollow voussoirs and were very strong. Another instance of the success of De Lorme's construction was the original dome of the Hall au Blé at Paris, 120 feet diameter, built by Legrand and Molino. This roof was destroyed by fire. Some objection has been made to this mode of construction on account of the labour required in cutting the number of mortises, making the longitudinal ties and introducing the pins. Therefore in some instances the mortises have been omitted, the planks bolted and spiked together, and the ties nailed to the upper and lower edges, the latter as ceiling joists or boarding. Nevertheless there exists in these roofs considerable waste of material and great labour as compared with some other roofs of similar spans. Colony Emy, a French engineer, proposed in 1817 an improvement on De Lorme's system by using the planks in the reverse position, in fact being precisely the laminated arch of the present day. On first sight it may appear that De Lorme's plan is the strongest, as the depth of the planks is greater than their width, from their being placed edgeways. In the other system thin boards are bent upon templets to the proper curve, and kept from separating by iron straps and bolts, as also by radiating struts, which are in pairs, notched out so as to clip the rib between them. The joints are much fewer, and the fibre of the wood coinciding with the curvature of the rib gives it considerable elasticity, so as to slightly yield rather than break under any violent strain. Colonel Ardent, who found some difficulty in obtaining in many parts of France fir planking at reasonable prices, and where squared oak timber was in abundance, designed some roofs for riding schools in which considerable lateral stiffness is obtained by a deep cross-strutted ridge, while in Colonel Emy's roofs a series of longitudinal timbers at back of arch are inserted for the same purpose. Other roofs of far greater span have been constructed by Colonel Emy, who after many experiments suggested the employment of a double curved rib having different radii. These held in at the springing were in the spandrel braced by timbers ranged like St. Andrew's crosses; iron bolts or timber binding-pieces pinned at the sides hold the masses together.

Responsibility for Plans.

The architect is responsible for supplying the contractor with proper details and instructions for the works at proper and due times during the progress of the works, and is liable to the building owner if the contractor is delayed or is compelled to stop work in consequence of absence of details or instructions. But it seems that no breach of this duty is committed unless the builder applies for the plans. Consequently little or no damage could result to the employer from the architect's default if the plans were not asked for. But where the omission to supply plans has led to delay in completion, possibly the owner might sue the architect for loss of profits which would have arisen from the timely completion. If the architect gives incompetent and useless directions, or does not give proper instructions as and when required, he renders himself liable to his employer. As between builder and employer, the contract usually gives the architect power to give instructions binding on the builder. When the contract provides that the builder shall act under the architect's instructions, in case of want of clearness of drawings, the architect, when asked, must give directions, and if the builder does the work without them the builder will be liable. In large engineering works the engineer frequently prepares plans and specifications not only of the work to be constructed, but also indicating the method of dealing with the subject matter of the contract, as if, for instance, he specified the scaffolding of a house. But whether he does so or not, it is clear that no warranty on which the contractor can rely can be implied, that no work can be executed according to the plans and specifications, whether by the engineer or by the building owner. But if the building owner suffers any loss from the negligence of his architect in preparing the plans and specification the architect is liable to the employer for such damages as he may have suffered in consequence, but not for damages which the employer has paid, but which he was not legally compellable to pay on the ground that there was no warranty, nor it would seem for loss which he has incurred by not insisting upon a contract which a builder had foolishly bound himself to perform.

New Olympic.—"A Royal Divorce" has become a success at the People's Theatre of London, and packed houses nightly, and at the matinées every Monday and Wednesday, attest the popularity of Mr. W. G. Wills's romantic drama, and Mr. W. W. Kelly's wisdom in giving a poetic play, magnificently staged, at the popular prices of 1*s.* pit and 6*d.* gallery. Miss Grace Hawthorne, as the Empress Josephine, commands the sympathy of the crowded houses, and has increased her reputation as a painstaking and gifted artist.

NOTES AND COMMENTS.

In May the London School Board advised the Legal Committee that, before commencing any legal proceedings against Mr. Robson, who was formerly architect to the Board, the three opinions already given by Sir Henry James and Mr. R. S. Wright against bringing an action against Mr. Robson, with the evidence taken in the case of the Kilburn Lane School, and any other papers which the solicitor may consider necessary, should be submitted to counsel, and further legal advice obtained by the Board. The Legal Committee now announce that they have taken the opinion of the Attorney-General and Mr. Henry Sutton, and in consequence they do not propose that any further action be taken in the matter. We suppose this puts an end to the discussions about Mr. Robson's lapses, and the ratepayers will have to make the best of the extra taxation which was caused by defects in the Kilburn Lane and many other schools.

The Birmingham Corporation have acted with their usual energy in dealing with the scheme for conveying water from Wales, and will be able to satisfy any Parliamentary committee that the subject has been properly investigated. A survey has been made by Mr. Mansergh which has enabled him to supply an approximate estimate of the cost of the undertaking. At first it is proposed to carry out the tunnels, cut and cover works, three reservoirs, and two lines of pipes, which will enable a daily supply of 23,000,000 gallons to be furnished. The cost of the works will be about 3,340,700*l.* If the scheme is carried out in its entirety with five reservoirs, the cost will be 5,654,953*l.* A second and independent estimate has been prepared by Mr. Gray, and he considers the sum of 3,340,700*l.* is adequate. The Parliamentary plans and reference books are being prepared, and will be lodged on the last day of next month. As there may be a contest in the committee-rooms the services of Sir Frederick Bramwell, Messrs. Hawkesley, and other eminent engineers and experts have been secured to support the Bill, and these gentlemen have already had an opportunity of going over the line of conduit and visiting the site of the principal works. If the Bill becomes law the works will be commenced as soon as possible, in order that they may be completed in 1900.

It ought to be a rule that architects, when they become members of a public body, should abandon their business during the time they hold office. Acts of theirs which may arise from mere forgetfulness, if they appear in any way to be connected with business are sure to be misinterpreted, and injury is done to others who are not ambitious to hold public office. A case of the kind is now giving rise to a good deal of talk in Bognor. Every visitor to the town is aware that the houses that face the sea are rather irregularly disposed, and it would be well if it were feasible to pull down and rebuild the whole line of sea-front. One of the owners of Marine Parade has had his house altered, under the direction of an architect who is a member of the Local Board. The work does not give satisfaction to the owner of the adjoining house, for he has informed the Board that serious injury has arisen to his property, firstly, by the bringing out of the bay window on the ground floor in excess of what it formerly was, about two feet beyond the line of projection of his windows and the whole range of the buildings, and the carrying of such the whole way up the house, whereas formerly it was a flat front from that point; secondly, by the formation of a covered terrace and a verandah at a much higher level than formerly to the higher windows, thereby obstructing the prospect from his drawing-room windows, which he had been in the enjoyment of for twenty-two years, and at the same time destroying the privacy of his rooms, as well as depriving him of a certain amount of light, and, correspondingly, air. The applicant said he could not believe such an injury had been knowingly permitted by the Board, as he believed it to be their invariable rule not to permit projections without the concurrence, first obtained, of the adjacent owners, and that was never sought of him or granted. He enclosed a letter from his surveyor, giving his testimony on the subject, and, in conclusion, asked the Board to require the immediate setting back of the said bay window and the obnoxious verandah, the latter of which was twice the width and longer than the previous one, while the bay window would be found to exceed the projection given and shown in the block plan deposited with the Board. The architect for the work maintained that it was impossible to show the projection on a small scale plan, but the Clerk replied that the adjoining houses were also omitted, otherwise the Board could have observed the extent of the projection. The architect then stood on his rights, and said the Board had approved of the plan, and he proposed that a letter should be sent to the complainant stating how the Board could see no reason to alter the approval given in January. The architect was advised by one of his brother-members not to press the matter to a division, and the Clerk said, as legal adviser, he was prepared to say that the consent of the Board to the building as altered was not given. Eventually discretion prevailed, and the consideration of the subject was postponed until a committee of the Board had inspected the building. There seems to be no doubt that in this case information was not furnished, for which not only the draughtsman of the plan, but the committee who passed it, should be held responsible.

During the session of the Birmingham and Midland Institute, which begins on Monday, the 19th inst., some of the lectures will relate to art. Mr. J. E. Hodgson, R.A., has taken "The Fathers of British Art" for a subject. Mr. W. Martin Conway, late of the Liverpool College, will treat of "The Early Stages of the Development of Art in the Ancient World." The fascinating theme of "Leonardo da Vinci" has inspired Mr. Walter Pater; if nothing new can be revealed, the lecture will at least express the old facts in an attractive way. Dr. Waldstein will again discourse about "The Newly-discovered Tomb of Aristotle." Lovers of music will, no doubt, find interest in Mr. Ambrusters's lecture on "The Wagner Festival Performances at Bayreuth." There will also be one by Mr. F. Niecks on "Jean Jacques Rousseau as a Musician," for among the first revolutionary efforts of the author of the "Contrat Social" was an attempt to popularise notation by the aid of numerals. He also copied music, and compiled a little dictionary of terms. Professor Silvanus Thompson is to lecture on "Complementary Colours." There will be other lectures on social, literary and scientific subjects.

The mystery that surrounds the origin of diphtheria is not to be cleared by the lectures by Dr. Thorne Thorne, assistant medical officer to the Local Government Board. But it is quite certain from his investigations that the disease is not the outcome of defective building. Among Dr. Thorne Thorne's conclusions is the following:—"That the steady increase in the diphtheria mortality has coincided, in point of time, with steady improvement in regard of such sanitary circumstances as water supply, sewerage and drainage." According to Dr. Thorne Thorne the disease is owing to a micro-organism, and there is nothing to show that the *bacillus diphtheriæ* originates within a building. At the same time, it is recommended, as among the means of preventing diphtheria, that such residences should be selected as will secure dryness and general wholesomeness of site and surroundings, together with ample exposure to sunlight and free movement of air.

The Hastings Poor-law Guardians have agreed to pay 650*l.* to the architect who prepared plans for a new workhouse, and claims over 5,000*l.* for his work. The sum will be paid without prejudice, and can only be taken as an instalment. The Guardians have again taken up the subject of building. It was agreed to apply to the Local Government Board for authority to reconstruct the existing house in an inexpensive manner, to use the infirmary as part of the workhouse, and to buy land for the erection of a new infirmary. It is to be hoped the Local Government Board will not sanction the scheme. Inexpensive rebuilding is a delusion, for the Guardians should by this time understand that substantial work alone is economical. The utilisation of the infirmary is also fraught with danger to the poor. But after the experience of the past, we daresay the ratepayers are not surprised at any proposal of the Guardians.

EDITORIAL OFFICE, "LADY'S PICTORIAL."

IT is not often the private office of the editor of a London newspaper is made the subject of an illustration. There is, however, no necessity for concealment, for Carlyle's joke about a sight of such a place being like to the "Satan's Invisible World Unveiled" was not warranted by facts. It will be seen that this editor's room is arranged and furnished with the good taste that would be expected. There are also many things which are remarkable for utility and ingenuity.

The cabinet in antique style, which forms a principal feature of the room, was produced by Messrs. Howard & Son, of Berners Street, whose reputation for that class of work is almost universal. The electric lighting has been successfully accomplished by Messrs. Laing, Wharton & Down. In one corner is a registered screen desk invented by Messrs. Godfrey, Giles & Co., which, when closed up, resembles a cabinet bookcase, and when let down discloses a nest of fittings, and forms an excellent writing-cabinet. The invention combines in one article a small cheval screen, a writing-desk and a small bookcase on one side, and at the back the lower part is fitted with a rack for music. At the top of the shelf there is fitted a piece of brocade, in which can be placed photographs, cards, &c. At the opposite end of the room is one of Messrs. Godfrey, Giles & Co.'s patent Cosy Corners, carried out in a style that corresponds with the rest of the fittings. At the end corner there is a wrought-iron standard, fitted with the electric light, and at the other with a small revolving tray, suitable for a book or a coffee-tray, or an ash-tray, &c. The editor's writing-table is also one of Messrs. Godfrey, Giles & Co.'s specialties. At the owner's will it can be made either into two separate tables, of Chippendale design, 4 feet square, or for large meetings or luncheon-parties, &c., it can be made into a table, 10 feet or 12 feet by 4 feet, the whole being perfectly solid and sound. The decorations, fitments, &c., have been also most successfully carried out by Messrs. Godfrey, Giles & Co. The editor's chair was specially made by Messrs. Hewetson, Milner & Thexton. The curtains were by Messrs. William Wallace & Co., and the lamp-shades by Messrs. Williams & Bach. The illustration is taken from a photograph by Messrs. Bedford, Lemere & Co.

CRAIG-Y-NOS THEATRE.

CONSIDERABLE interest was aroused in the Swansea district by what may be termed the inauguration of Madame Patti-Nicolini's theatre at Craig-y-Nos Castle. The theatre is situated to the right of the castle, and adjoining the French billiard-room and clock-tower, the façade not being situate in the general front of the buildings, but facing the interior grounds. The theatre is comparatively plain outside, but the façade is sufficiently distinctive to mark the purpose of the building, and on the pediment stands in gold letters the name of the building, "Patti Theatre." There is no grand entrance from the exterior, the theatre being chiefly for guests, and the principal entrance is from the castle itself. A wide corridor leads from the French billiard-room and passes along the side of the theatre, long windows to the right giving views of the open country. The doors of the theatre are to the left on this corridor, which gives access both to the floor and the stage of the theatre.

The chief features of the theatre are, perhaps, its lighting and its peculiarly arranged floor. The lighting combines all the most recent inventions for electrical effects and changes. The electroliers are gracefully arranged throughout the building in a variety of charming forms. The central electrolier in the ceiling has sixteen lights, and, in addition, brackets of three lights each are employed round the building. On the stage the lighting is perfect, and the instantaneous changes of hue which can be produced by switches throw the limelight effects of local theatres greatly into the background. The floor has been arranged with a view to utilising the theatre as a ballroom when desirable. For this purpose the floor, which slants away towards the stage end, for the purpose of giving a good view, can be raised without any difficulty to a perfect level with the stage. A ballroom 62 feet long can thus be provided at any moment, and the fact of cosy drawing-room effects being obtainable at the stage end certainly does not diminish the pleasures of the ballroom. Upon entering the house the visitor is struck by the beauty of detail shown everywhere in this miniature opera-house. Before him rises the act-drop, which is a picture of the prima-donna in the character of Semiramide driving a chariot and pair of horses. The beautiful cove ceiling has been decorated within the past few months, and presents a very attractive appearance, whilst all round the auditorium rise Corinthian columns with decorated surfaces, dividing the walls into panels. Behind the auditorium the building is curved, and a small gallery or tribune, which can accommodate a few extra visitors, is here provided.

The building is seated for 180 persons, though it is possible to find room for 200. The chairs in the first few rows have arms, and are covered with blue silk plush. The decorations are in quiet tints of blue and ivory white, with a plentiful use of gilding. The orchestra is divided from the auditorium by a low balustrade, and is sunk 6 feet below the stage level; it has room for a band of sixteen. The proscenium is striking; it is 20 feet wide and 19 feet high. Surrounding it is a handsome border, with a pediment and descriptive and decorative ornaments at the top. The frieze of the proscenium is panelled, and this panelling is continued round the auditorium, bearing the names of great composers. Rossini, Madame Patti's favourite composer, occupies the central position on the proscenium, and is faced by Shakespeare above the gallery. The tableau curtains are extremely handsome; they are richly festooned, and are of electric blue silk plush. The stage is 24 feet deep and 40 feet wide, with ample height to allow the whole of the scenes to be raised into the flies without rolling. Every modern appliance necessary for opera and pantomime has been provided. There are electric footlights, rows of batten lights in the wings, and ground lights with coloured lamps for giving coloured effects. The number of lights in the entire theatre is 281, and all these are under the control of the prompter by means of a handsome switchboard which has each department labelled. A cellar under the stage accommodates the machinery for working the scenes and traps, while alongside the auditorium, on the opposite side of the corridor, is a large scene-dock, 32 feet long and of full height, to accommodate scenes when not in use. Behind the stage are five dressing-rooms on the first and second floors, with a loft over for properties. The architects were Messrs. Bucknall & Jennings, of Swansea and London; the builder was Mr. H. Smith, of Kidderminster; the scenery was painted by Mr. W. Hann, of London; and the decorations done by Messrs. Jackson & Sons, of London. The electric lighting has been carried out by the Wenham Light Company.

NEW DEPARTURES IN ARCHITECTURE.*

By Professor T. Roger Smith.

THE subject that I have chosen for this evening—"New Departures in Architecture"—can be illustrated in more than one way, and, indeed, I propose to touch upon more than one side of it. As perhaps some of you may have anticipated, new departures in architectural education suggested the idea, and these, at any rate, so far as they affect this college, will not fail to receive notice before I close. But the actual history of buildings and of those nations who have successfully practised building is wonderfully full of new departures, and it appeared to me that it would be more interesting and more instructive if we gave a few minutes' attention to some of the important new departures of which we can trace the effects in art, instead of spending one whole hour in the consideration of classes, examinations and the other machinery of learning. I am going, therefore, to ask you to glance at that part of the history of architecture in Europe which is best known to us, simply with the object of noticing how, from time to time, a new departure has been taken, and of seeing what an impulse has been given to activity thereby.

In the western world nothing seems a stronger motive-power than the desire for change—for something new; and nowhere is this better illustrated than in European architecture. We might perhaps extend this remark beyond the limits of the western world, but Oriental people seem to be less bitten with the constant search for the new in art. It comes to them sometimes, and when they are stirred up by changes imbued or forced upon them they, like ourselves, seem to receive a great impetus from a fresh departure; but they can go on for long periods doing very much the same thing without degenerating and with one notable exception, European examples will suffice for this evening. We shall see, if in the short time we have to spend together I can succeed in sketching a few typical instances, that the periods of activity in European architecture have also been the periods of change. Its periods of depression and stagnation have also been periods of monotony.

The story of European architecture should properly begin with that of Greece, but we must pass on, almost without pausing to consider that noble art; and yet the history of Greek architecture at its best is that of a period of swift and rapid development, culminating in a too brief time of the most remarkable refinement and completeness. But many of the new

* Opening lecture to students in Architecture and Construction, at University College, London, on October 5, 1891.

departures are not quite obvious ones, nor are they easily illustrated without a reference to a good many minute points, and we will, therefore, start from the fully-matured Greek architecture of the time of Pericles, without going further back, to consider out of what artistic materials it had been evolved.

Here we have a style of architecture severe, dignified, refined, using only square-headed openings, and depending chiefly upon the column, and an entablature carried by it for its architectural effects. The construction was extremely solid, most minutely exact; accurate setting-out, such as has hardly ever been attempted elsewhere, was the rule. Most of the important buildings were of moderate size, erected in marble, enriched by the finest sculpture, and the refined perfection of their design and execution was their chief means of rousing the admiration of those who saw them. The ornaments were most graceful and exquisite, but not lavish; great pains were expended to produce even minute improvements, and a simple but impressive dignity was the character aimed at.

The decline of the Greek Republics—the period of the successes of Alexander the Great and the diminution of the political and martial energy of Greece—coincides with a time of comparative decadence in Greek architecture. The remains that have come to us from that time are not very impressive, or in fact very extensive. Much that was built has perished; but we have enough to show that in the many parts of Europe and even Asia to which Greek architecture had more or less extended, it was very much less forcible, powerful and complete than it had been in Athens and Corinth or even in Asia Minor at the best time. Indeed, the world, so far as architecture was concerned, was very ready for a new departure. In time, as you all know, the new departure occurred, and so energetic was it as to occasion perhaps the most complete change, and to give perhaps the most powerful impulse that architecture ever was affected by. I allude, of course, to the establishment of Imperial Rome, to the vast structures raised by the Roman power, first in the capital and then in all the great cities of the Empire, and to the novelties in construction as well as in design which we find to characterise the Roman buildings.

The change from Greek to Roman illustrates the truth that novelty, though always associated with activity, is not necessarily a guide to excellence. If you set out on a downward road yours is still a new departure. There are bad novelties as well as good ones. Roman art was inferior to Greek, and alas! it is no rare phenomenon to find that the human mind, sated with that which is excellent, takes a new departure, not in pursuit of that which is better, but only of that which is different; so that, if the search for novelty has sometimes led to vast developments, it has at other times ushered in a decadence, and even precipitated a decline. To some extent it was so in the case of the Roman developments of architecture.

The Roman nature was forcible, overbearing, fond of vastness, of magnificence, of the parade of power, and impatient of refinement. When, after having overcome every other civilised or semi-civilised people, the Romans turned to the embellishment of their city as one means of glorifying their own greatness, what they desired to do was to indulge in display. They had, so to speak, elbowed themselves to the front, and now they desired to enjoy the place they had won, and to make a free use of the boundless stolen wealth at their disposal. Such energy, such resources, have never in the history of the world been lavished upon building before or since, and Augustus, who boasted that he found Rome of brick and left her of marble, was the first to display this ostentatious passion. What was wanted was quickly to erect vast piles, and to adorn them lavishly; and the Roman architect developed two hitherto little-used constructive methods, and made them his chief auxiliaries. These methods, capable of doing so much, and not quite unknown before the Roman day, had not been pressed into the service of architecture, or at any rate of such European architecture as has left remains which have come down to our day. These methods were the use of the arch and the use of concrete. The possession of these means of rapid and ambitious construction enabled the Roman architect to perform surprising feats. His new departure starts from the arch and concrete, and was favoured by the command of material resources and wealth, of slave-labour, of marbles, metals, painting, sculpture, in unlimited profusion; and, in short, of the spoils of the whole civilised world, and was stimulated by the energy of the most energetic race known to history.

If you wish to know how vast and how novel were the structures raised in the few centuries of Roman empire, read the lectures delivered in recent years at the Royal Academy by Professor Aitchison. Nowhere has the picture of the profusion, the variety and the splendour of Roman Imperial architecture been better described or more fully illustrated. The fact that any remains are still left in Rome after centuries of active destruction and plunder and a thousand years of neglect and occasional demolition is an astonishing tribute to the energy with which the Romans built and to the vast mass of building work which they constructed.

Let us for a moment inquire how this new departure operated and what there was about two such simple and (to us) familiar things as concrete and arches, which contributed to so grandiose a result as was actually attained. First, then, consider the change involved in the general adoption of the arch. In the buildings of the Greeks, Egyptians and Persians the openings had been spanned by lintols, that is to say, horizontal beams of wood or blocks of stone or marble, and as in all buildings pretending to a monumental character wood, as a material liable to be burnt and to decay, was not admissible, stone lintols formed the heads of doorways and windows and spanned the distance from one column to another. The consequence of this was that no opening could be wider and no columns further apart than the length of such a stone lintol as could be trusted to go from column to column. Hence the scale of every part was restricted. With the arch the size of openings was almost unlimited, and by means of it the distance apart of columns was enormously increased. But this was not all. The arch led to the vault, and this gave the means of covering large interiors with a permanent roof. The Egyptian interiors had been, it is true, permanently roofed in stone, but at the expense of filling the space so roofed with a forest of massive columns. The Assyrian, Persian and Greek interiors appear, from all that can be inferred, to have been roofed in timber, and, consequently, to have been open to the destruction that has actually overtaken every one of them. The Roman, however, making use of that continuous arch, which we call a vault, and of that admirable arched construction on a circular base which we know as the dome, was able to cover in his most vast interiors with a roof almost indestructible. His command of the arch also enabled him to support these vaults on a few massive piers, and thus grew up a series of grandiose structures which were of vast and noble forms, and which he ornamented with lavish decorations.

The use of concrete—that is to say, of a masonry made of small materials a little coarser than our concrete—enabled the Roman to construct both the vaults and the vast piers which supported them rapidly and comparatively cheaply, while it led him to substitute a superadded surface of stone or even plaster for the solid masonry of the finest Greek buildings. You can easily see how these modes of construction constituted a new departure, and, though they led to results to which we cannot give unreserved admiration, as the buildings were often deficient in refinement and grace, they undoubtedly were associated with a stupendous display of energy. The Imperial palaces, the thermæ, the endless porticos and colonnades, the forums, the aqueducts, and the mansions of Rome formed a vast and sumptuous series of buildings.

The next new departure in architecture was more due to a combination of moral forces than to structural ones.

It was not, however, in structure only that the Roman introduced change. His methods of decorative treatment, and in some cases his methods of dispensing with almost all that was decorative and relying upon the outlines, and the mass of his structure and the disposition of the openings in its walls, for architectural effect were new. He made the Greek orders coarser and in every way less elegant, and he reduced them in many cases to the position of subordinate ornaments, but he used them with a lavishness and connected arches with them with a boldness that were astonishing, and opened a new chapter in the history of architectural design.

When the strength of the Roman departure had fully spent itself a new force arose, and in Rome itself, but more emphatically in Constantinople, led to a notable new departure. I allude to the architecture that sprang up after the recognition of Christianity under Constantine, and his removal of the seat of empire from Rome to Constantinople. At and around Rome the influence of the religious motive power is to be seen at work in the establishment of that form of the architecture generally known by the name Romanesque. At Byzantium—starting with the new name Constantinople—combined religious and political forces resulted in the more original and very vigorous style which we know as Byzantine. Not unnaturally, the more pronounced the novelty the more brilliant was the result.

Both Byzantine and Romanesque grew out of Roman art, but each is widely divergent from the stem out of which it sprang. At Byzantium many of the conditions of a new departure on a great scale were combined, for, in addition to a new religion, there was a new seat of empire, a new mixture of races. Byzantium was largely a Greek city, and the combination of Roman energy with Greek skill and taste seems to stand out clearly in the architecture. Some of the early steps in the development of Byzantine art are lost to us, but the culminating point of what must have been a rapid course remains. In a surprisingly short time a building of great construction and great artistic merit, and original in almost every respect, was reached. I refer to St. Sofia. Here the methods of the Roman architect were all known and followed. The new style displays an almost exclusive employment of the flat dome, usually lighted at the base, and carried on the domical corbels known as pendentives. The square plan, and the quality of the

carving, mosaics and other enrichments are distinctive. It is easy to recognise that Roman architecture was the starting-point, but we find that an entirely new character has been acquired by the buildings, and that an original and a most admirable style had sprung up. I hope that it may yet prove that remains enough exist to show many more of the steps of this metamorphosis than have yet been traced; but whether that be so or not, St. Sofia presents one of the most brilliant examples known of the result of architectural development, and a development found exactly in that part of the world to which a specially powerful stimulus had been given by political and religious events.

As has again and again happened, after the stirring up of men's minds, which the circumstances of this new departure occasioned, had subsided, they here fell into a very regular and unchangeable order, and Byzantine architecture has continued, without much modification or development, to prevail in those Eastern parts of Christendom where the Eastern Church holds sway, even to the present day. In the West it has not been so.

The Romanesque division of Early Christian art was not, as has been said, so strikingly original, and its development was long hindered by the invasions of the northern hordes which overran Europe. Later on, however, after it had become the universal style of all Western Europe, it met with influences which varied it, and in some countries, especially in Germany, it was carried to a high pitch of perfection.

Meantime, however, leaving out of notice in this hurried sketch other interesting forms of Christian architecture based on Roman—such, for example, as the one which is to be found in the ruined cities of Central Syria—we will, if you please, come down to the next prominent new departure in the art, one of extraordinary interest and splendour, but less familiarly under observation.

Arabia was the country in which a new religion and a new seat of empire rose with a marvellous rapidity, and from here the Mahommedan faith spread, and gained a hold on half the Oriental nations of the globe, such as has not relaxed for more than a thousand years. It is true that we might almost have left Mahommedan architecture out, as not a European phenomenon, although it was ultimately brought into Spain by the Moors; but I could not well omit such a wonderful instance of a new departure, the more so that, as the original materials out of which the Moslem architects elaborated their style were, to a large extent, the lingering traditions of that Roman manner of building which had become practically universal, and, as we have just seen, had furnished the basis on which Christian architecture stood; and that the Mahommedan invention of the pointed arch reacted on Western Christendom at no very distant date.

Some at least of the peculiar beauties of the buildings of the followers of the Prophet seem due to an innate faculty for designing and executing decoration, which the Arabs, the Egyptians and the Persians appear to possess. At any rate this was stimulated and drawn out by the extraordinary impulse given by Moslem conquests and Moslem conversions among the nations where mosques began to be built. No phenomenon in history is more startling, and nowhere is a more brilliant and more startling display of energy met with. A new departure could hardly be more completely made than was made by the followers of the Prophet, and a more complete recasting of known features into new forms, and a more remarkable creation of new ornaments and original decorations has never shown itself on the civilised globe. The dome, the pendentive, the arch, the column, the rough construction encased in plaster, are all derived from Roman methods; but in no case do they look like the same things as in Roman buildings. The arches are pointed or ogival, the domes are often pointed, the pendentives are masked, the openings are filled with tracery and coloured glass and the methods of clothing the rough structure with ornament are very dissimilar; while the surface decorations, the pierced stone and metal panels, the wooden gables, the tiles, the inlays, the mosaics, the coloured and gilded plaster stalactite work, the nook shafts with their capitals—these all are new and charming creations, as original as they are beautiful.

The next new departure in point of time is one which affects Western architecture and which got its impetus largely, though not exclusively, from the indignation roused in Western Europe by the progress of Islam, yet got its chief feature from the East. Jerusalem was in the hands of the followers of the Prophet, and the Crusades undertaken to rescue the Holy Sepulchre from this profanation were embarked upon by all Christendom with a zeal which was partly religious, partly fanatical, but all-absorbing, and which roused Europe to the most extraordinary pitch of excitement. The first Crusaders came back, having seen the Arab buildings in which the pointed arch was in use, at a moment when the architects of the West were much in need of some such feature. The Crusades were, however, not the only outcome of the religious zeal of the eleventh and twelfth centuries—they were not merely the most conspicuous development in which it showed itself, but they also served to react upon it and keep it alive. From various causes the founding of religious establishments, or the recasting of them on larger lines where they already existed, began to be one of the chief occupations of European energy soon after the year 1,000, and this work, in various phases, continued for from four to five centuries, a long period of activity compared to almost any other architectural period.

We in England have admirable opportunities of observing the whole development of this interesting time, and nothing is more surprising than to note, as one compares the buildings of one part of this period with others a little earlier or a little later, how continually the architects were taking a new departure, and what scant care they mostly had for the work that lay behind them, so long as they could do something different to what was in hand at the moment. They forgot, perhaps, that the generation to follow, or even in some cases they themselves, would turn an indifferent eye upon what at the moment seemed so new and so good in the excitement of a fresh modification or a new idea.

Leaving the larger field of European art, let us, now that the subject can be illustrated by examples well within our own reach, consider the successive phases through which English art went during this time. We possess still a few scattered examples of that phase of primitive Romanesque which we generally call Saxon. England, as you know, though the fact is often forgotten, England as she is at the present day is the most startling tribute to the value of Christian missions to the heathen that the world can exhibit. The results of the missions which planted Christianity in this country at an early date are to-day of incalculable and growing magnitude. Even in the far-off times before the Norman Conquest there were many churches and monasteries scattered all over Great Britain; but the country was very poor—in many cases these buildings were of timber, or timber and reeds. Even where they were of more solid materials, they were usually small, rude and inconvenient, and in nearly all cases they have been superseded. Remnants, however, linger sufficient to give an idea of what was being done.

Suddenly the Norman Conqueror appears on the scene. The country is taken possession of by strangers, who seize upon its resources, whatever they were, and turn them to their own profit. In a comparatively short space of time Norman castles began to make their appearance, and in almost every parish in England a church is built or rebuilt, and in many of the leading cities a cathedral. It is perfectly startling to find how great the building activity of the period following the Conquest was; and it is in accordance with the principle which I am bringing under your notice, that this new departure resulted in an architectural development of great energy, if of varied excellence. The earliest buildings resemble those which were at the same time being erected on the other side of the channel in Normandy, from whence the invaders had come; but very soon indeed peculiarities begin to develop themselves, and Anglo-Norman became a distinct and well-marked architectural style with an extremely pronounced character and beauties all its own. In very few cases does an important Norman building survive unaltered, but such a cathedral as Durham will serve as an illustration of what many of our great churches were at the moment of the fullest development of the style.

At the end of the twelfth century the churches that were built were large in plan. When circumstances allowed they were grandiose. The religious establishments were planned with great completeness, and often of vast extent. The castles, on the other hand, had not yet become, as a rule, extensive; they were still mostly isolated towns, very strong, but without outbuildings.

In a church the piers were large, often heavy; the arches semicircular; the vaulting groined, as the Romans had formed it, but almost always confined to very moderate spans. The carving was barbarous, but rich and distinctive features, such as the chevron or the bird's beak, though admitting endless modifications, were not departed from. The masonry, of very regular execution outside, was often but a skin to cover a large mass of rubbish very poorly put together, and the enormous mass of the piers and walls being obtained in this way gives an air of overwhelming strength, which the behaviour of the buildings under the test of time and weather has not always borne out.

From the time when the pointed arch came in the architectural history of our country and of France, and to a large extent that of other countries, gives a series of new departures of the most interesting and pleasing kind. What we are accustomed to call Early English Decorated and Perpendicular are phases through which Mediæval architecture passed, under a stimulus which lasted for more than three centuries after the introduction of the pointed arch. Of course many causes concurred to keep up the great building zeal of the Middle Ages, but that zeal in itself is not sufficient to account for the eagerness and skill with which new forms, new mouldings, new enrichments and new vaults were elaborated, each one rising out of the one immediately preceding it, and taking its place, and for the rush after novelty kept up so long; and I think what

may perhaps be called the artistic impulse came more from the sudden introduction into architecture of a new and unthought-of feature than from any other definite cause.

It is worth remark that, so far as one can form an impartial judgment, the pursuit of change did not by any means always mean the attainment of growth. Early English was, on the whole, a finer style than either of those that followed it, and I think most judges would also admit that Decorated was finer than Perpendicular. What was secured was vitality and change, not necessarily advance.

We come now to the remarkable influence out of which has grown the modern world, and to which we generally apply a French name, the Renaissance. Here, if anywhere, we have a new departure, wide-spreading, far-reaching, full of energy, affecting not only the arts, but literature, science, religion and politics. That side of it which presents itself to our notice to-night consists of a return to the forms of Classic art in painting, sculpture and architecture, begun in Italy and spreading through all Europe. In the sister arts, as in literature, this return soon formed a fresh starting-point, and modern painting, and not a little of modern sculpture, has followed original lines of development which have led to the establishment of European schools —schools which, on the whole, have reflected more or less faithfully the varying changes of modern thought and culture. Architecture has been less fortunate, and it is difficult to say why. The fact, however, remains that from the sixteenth century to the nineteenth we have done nothing but revive past styles. From time to time brilliant results have been obtained by mixtures of styles. What, in a very different parlance, is termed a "blend" has more than once not only produced good buildings, but appeared to be likely to originate a style of modern architecture, but it does not seem to take hold, and Europe has gone on erecting buildings for all sorts of modern purposes, and sometimes with the greatest originality in their adaptation to their purpose, but all clothed in the dress of some bygone style. I am, of course, speaking broadly, and I do not wish to detract from the many excellences of much modern work, but it is to be heartily wished that there was more of it which one could not so readily refer to some original. In our own country, for example, we have had a recent Queen Anne revival—that is to say, a revival of Dutch architecture as originally introduced by William of Orange. Previous to that we had a Gothic revival, beginning with Tudor and working more or less steadily back. Before that, the revival of mature Italian had filled Pall Mall with the club-houses; a little further back was the Greek revival, and previous to that the Palladian one, and so on.

And yet, while all this has been going on, events have occurred which have constituted a new departure, of which Great Britain has served as the starting-point. Steam by land and by sea, telegraphs, cheap literature, and all the circumstances of our new day have caused a rapid accumulation of wealth, and occasioned numberless fresh needs which have stimulated building to a remarkable extent, but have left architecture but little affected. The modern mind has been more influenced by the vast strides which science has made than by anything else, and we, perhaps, ought not to be too much astonished that our vast systems of railway constructions exhibit consummate skill and but meagre art, though it is none the less a matter for regret that it should be so.

After all, perhaps, we are not without indications that something like a new departure in architecture is possible—that a twentieth-century style may exist. If you look at representations of the best buildings in America, you see works largely bearing the impress of one man's genius, but which are original as well as excellent, which all hang together by a certain resemblance to a type, and yet possess individuality, character, and what the French call *cachet*. If a modern style of architecture is to arise at all, America is a country which seems to offer a very likely field for it to grow in. The country is a new one, the people are fresh, they aim at cultivation, but most at originality; they are able to dispose of great wealth, and their architects are men of very high culture indeed. If to these conditions we add a climate different from that of Europe, and which would consequently make it undesirable to transplant European buildings to America, we have a combination from which I confess I both hope and expect great things.

A second example of something like a new style of architecture has been lately seen by many in Paris, where new materials have been employed under new conditions, and with very striking results by our artistic neighbours the French in their great exhibition buildings.

The conditions of an International Exhibition were met by us in 1851 by a temporary structure exhibiting very great ingenuity, and in which the qualities of glass and cast-iron were turned to good account; but, unfortunately, though the thing was a novelty, it was only a temporary structure of the cheapest sort, after all, and did not advance architecture. The French, in their exhibitions have always been more ambitious, and I think many of those who have seen the buildings erected for the 1890 exhibition, and still standing, will feel that the architect, making the utmost use of the structural properties of iron, and of the decorative qualities of ceramic slabs and tiles, metals, and other things which go with his construction, has gone far to establish a scheme of building quite entitled to be called architecture, and partaking of the dignity and solidity and stability which we look for in architectural works.

We ask in some anxiety whether we have any parallel to all this in our own country, and, if so, where are we to look for it? I think we may find such a parallel, though in a series of buildings not so ostentatious or colossal as those for the Paris Exhibition. There are not a few virtually new materials, and new combinations of materials, now in use in England, and there are undoubtedly many new situations or new developments and extensions of old ones. Iron, concrete, terra-cotta, faïence, encaustic tile, as we know them at the present day, are practically new materials, and some of them—like iron and concrete—are equal to two different materials each, or even more than two, according as they are manufactured.

It appears to me that in the employment of appliances which science has put within the reach of our constructors for such modern purposes as suggest, nay, demand, artistic treatment, we have the nearest approach to a new departure which has shown itself yet, and that here, if anywhere, we have a prospect that the twentieth century may perhaps attain a definite English style of its own. The most successful architect of the period now drawing to a close has been unquestionably the foremost to employ new inventions, or at least to give them a chance, and to him we owe it that the English people had an opportunity of seeing on a great scale in the Natural History Museum what wide architectural possibilities the employment of terra-cotta could introduce, and certainly the most original buildings of the present day and the most original designs for great buildings about to be erected seem to be based, as far as their structural peculiarities go, on the use of iron, and in respect of their artistic qualities on the free employment of terra-cotta. Here, I venture to suggest, is a chance for the architects of the coming generation.

At any rate I would very strongly urge on you gentlemen forming the audience who have your career as architects before you, that if a new departure comes in your time you are safer to go along with it than to stand aloof. It may, I admit, lead you astray, but as matters are at the present day it is far more likely to lead you ahead and to offer the best chance of doing good and original artistic work.

If then you, or some of you, are to work at the evolution of a new English architecture, original and good, and having for its starting-point the new or improved methods of construction, and the new and improved materials in use, or likely to come into use, it is almost self-evident that you must master the science of construction and the art of architecture or you will not be prepared for the task.

We have taken, in respect of professional matters, a new departure which has led to a considerable change in our internal economy as a profession. The Institute of Architects has obtained a new charter. Associates are for the future only to be admitted after examination, and two examinations for students are set up. All students who aspire to take a good position in this profession will desire to pass these examinations, and thus the point of view from which they regard their present position and opportunities will be considerably altered. This may or may not be an unmixed good, for a new departure—let me say it once more—is not certain to bring improvement. All that is certain is change. It devolves upon us all, then, to do our best to make the change advantageous.

Let me point to an example which shows that sometimes the changes from which a new departure may take its start may come suddenly. At the present moment the carpenters of London are on strike, and it seems clear that in important buildings iron will have to be substituted for carpentry in the roofs. How many architects are prepared at once to deal with the structural difficulty, and to design appropriate and architectural iron framework for the roofing which was to have been in timber? I do not know what answer ought to be given to that question, but it will, I think, be clear to you all that it is only those who understand how an iron roof is framed who would have any chance of being able to make such a change in their building lead to a good artistic result. If a man has not sufficient mastery of his roof to know how to make it structurally sound, how is it possible for him to make it architecturally good? On the ground, therefore, of being fully prepared, not only for the present course of practice but for possible changes, it seems to me more than ever desirable for architectural training to be thorough, and I think the opportunities for scientific education, concurrently with the architectural and structural classes which have been arranged for in this college, are eminently calculated to afford the means of such a training. Those opportunities I will in a few moments refer to more pointedly.

There is, however, another aspect of the matter of less real weight but of more immediate urgency, and nearer to every

student or intending student. I allude to the preparation necessary for passing the examinations established by the Institute.

You will, many of you, be desirous of passing the examination. I hope that you will all be even more desirous to fit yourselves for the practice of your profession. It is not quite the same thing. It is possible to pass an examination partly by cram and partly by luck, without being by any means well educated; but at the same time my honest feeling is that the men who fairly and studiously master the subjects in which the examinations are held, and who pass as the result of study of that sort, have done very much indeed to fit themselves for the practice of our profession.

Now, towards that sort of preparation this college is able to offer facilities which have not been available before. I have always wished for a means of supplementing such instruction as is given in the classroom by instruction at the drawing-desk, and now the liberality of one of the City companies—the Carpenters' Company—has provided a fund out of which the necessary expense of a teacher of drawing can be met, and we are to have a class for architectural drawing, including construction on the one hand and perspective on the other, which will meet two afternoons in the week, with the classroom open on other afternoons for practice. I hope some architects may spare their pupils on these afternoons to come and be systematically taught. I especially hope that students who are preparing for the Intermediate Examination and who consequently have a series of careful drawings to prepare as testimonies of study, will some of them come and prepare them under the careful eye of Mr. Stirling, who has undertaken to conduct this class, and who will co-operate with me and Mr. Elsey Smith in the direction of it. And I venture to suggest, though with some diffidence, that some young architects recently started, and who have the command of part of their time, might find it pleasant and advantageous to come and spend two afternoons a week at work which would improve and strengthen their powers as designers. I hope also that some students who are not yet articled to an architect, but intend to be so, may be found who will spend a session at the college. For such a course has been arranged, and what is called a "composition ticket" will be issued, covering such classes as will in the most profitable way fill up their time. This, supposing the student to be sufficiently grounded in mathematics, would cover as a rule graphics and graphical drawing, part of the courses of engineering, mechanics and physics, economic geology, the technology of building materials, surveying and levelling; in addition to architecture, construction, architectural drawing and applied art.

The Carpenters' Company has also enabled us to establish a night class for building construction, to be taught partly by way of lectures and partly by drawing, and this probably appeals to a rather different class of students. We hope to deal with the principal subjects of the examinations in construction held by the Science and Art Department, and to consider them in as practical a way as possible, so that the members of this class may find themselves able to draw plain—and perhaps difficult—construction clearly and intelligibly.

Of course, the two classes which for so many years have been conducted here will continue as before—the class for the study of architecture as an art, and that for the study of materials and construction; the class for practice is also in the programme, but it will not be held (as in former years it has) in the first term. These steps are not taken with a view to oppose the scheme of the Architectural Association, to which I wish all the success it merits, but they direct themselves to rather a different class of students, and I believe in London, with its large numbers, there is room for many organisations to work harmoniously.

There are always a certain number of students who have command of their own time in the daytime, that is to say, who for the time being are not doing office work, and these, I think, will find both the afternoon drawing-class and the scientific course to which I have alluded suit their requirements. Students coming from the colonies and from the country, as well as London students, will, I hope, find this course meet their requirements. I sincerely hope that some of my brother architects who take pupils may, as has been suggested, find it possible to send them to the college to be taught drawing. I have known several instances in which men of standing who took pupils were so impressed with the desirability of definite teaching of draughtsmanship and of architectural forms and details, and so forth, that they engaged a competent instructor to come and give lessons to their pupils. I believe the late Sir Gilbert Scott at one time did so. What we offer at the college is this kind of instruction adapted to the needs of pupils, only those who are to enjoy it must come to the teacher instead of his coming to them.

There is, however, another class of youth for whom I have always felt that provision should very often be made. I mean he who has just left school, who has devoted himself to architecture, or been advised to do so, and who has not yet embarked on the occupations which await him in an architect's office. He has in some respects been prepared for the profession, in others not; but in addition to the need of some special studies and of a training in drawing, he has to learn the management of his own time and the art of taking some care of his own education. A college session of the sort which has been sketched out affords the best possible half-way house between the organised regularity of a great school where the employment of every hour of the day is mapped out, and the entire freedom from all guidance as to his use of his leisure which a pupil in an office oftener than not steps into; not to mention the fact that, to begin his pupil career with some skill in draughtsmanship and in the knowledge of the scientific subjects that bear on the profession and some knowledge of architecture will be of extreme service to him, both at the outset in aiding him to pass the extreme examination at the Institute and throughout his whole student course.

You will notice that whatever new departure I advocate as to instruction, I do not suggest the idea that a practical profession like ours can be efficiently learned without such opportunities of seeing and taking part in practice as pupils enjoy, and as, so far as I can at present see, no other system than pupilage is likely to afford; and I am the more desirous to emphasise this, because at one time I held a rather different view, and the conclusion which I here advance is one which has been impressed upon me by experience. I know that in the medical profession it has been possible, and has been found of advantage to do away with pupilage, but that is only because fuller opportunities of seeing practice and taking part in it are afforded in the hospitals than were open to pupils in the practice of the medical men to whom they were articled.

Let me add one or two words about the evening class for building construction and structural drawing. I hope we may teach those who attend to understand how buildings are put together, and to make drawings to show clearly and legibly the nature of ordinary and, to some extent, of difficult structures. There are, of course, two ways of drawing construction—one is to enlarge, or copy, or reduce another drawing or an engraving in a book; the other is, from a knowledge of the thing to be drawn to represent it as it ought to be. Copying may or may not be instructive. It is difficult to copy a drawing without learning something, but it is possible to do it without learning much if it is done perfunctorily or blindly. But if a man is working from his knowledge of a piece of construction or from a description and sketches, and is putting that upon paper without having an exact original to reproduce, he is doing what is much more like the actual making of working drawings in the business of the construction, and he can hardly fail to extend his knowledge and to make it precise and exact.

To all engaged in architectural work a mastery of the pencil is more necessary than any other accomplishment or attainment. With the pencil chiefly we preserve our notes of what we learn. Whether it be architectural detail or construction, or both at once, we study them on existing buildings by means of the pencil; and a sketching tour is at once the most pleasurable and most profitable part of a student's or an architect's time. Again, it is pencil in hand that designs are made and structures contrived, and few, indeed, would be able to design even a simple piece of work had it to be thought out without the constant aid of the pencil, and, let me add, of the india-rubber. Once more, when the architect's own ideas are fixed, the whole thing, be it simple or be it complex, must be drawn if anyone else is to form an idea of what it will be like. It must be drawn out for the inspection of clients and of any authorities who may have a share in deciding how a structure is to be built; and, last, but by no means least, the whole thing is to be, so to speak, built upon paper for the guidance of the surveyors who estimate what it will cost, and of the builders and operatives who actually carry it out.

Of course, for simple works the requisite drawings need only be simple, in more complicated ones they will require to be anything but simple; but do not forget that as matters stand at the present day a mastery of the pencil, in other words good power of drawing, is essential to every architectural student. I think I may go further and say that to have a prospect of success as an architect and of rising at all in a profession where the competition is keen, a man must be not only a good but an excellent draughtsman. It is possible to be an excellent draughtsman and a bad architect, but in the present day it is not possible, I think, to be an architect without being a draughtsman.

It has not always been the case that facile and finished draughtsmanship was required of the architect, but I believe the circumstances of the present age render it essential, and I accordingly press drawing upon your attention as a matter of the utmost importance. There is much that has to be known, a good deal that ought to be seen, and not a little that should be read. But the things that require to be drawn, and the method of drawing them, are of paramount importance, and make a claim on your attention that nothing should surpass.

I am quite aware that in thus urging the importance of

drawing I am not saying anything new—not attempting a new departure—for all that I have said has been true for a generation past, and has been repeated again and again from the lips of men entitled to be heard with respect. But yet the topic of my lecture comes up in another shape, and, in fact, in the shape which first suggested a new departure as the subject of this lecture, for an architectural drawing-class is in this college a new departure. It has for long been my desire to see the way to attempt it, and now that the Carpenters' Company has rendered the attempt possible, it will be my most anxious desire that the class shall be furnished with students, and that the students shall gain the utmost possible benefit from the class.

THE ARCHITECTURAL ASSOCIATION.

THE annual conversazione of the Association was held at Westminster Town Hall on Friday evening, under the presidency of Mr. F. T. Baggallay, whose year of office will form an epoch in the history of the Association, owing to the inauguration of the new curriculum. The assembly, including members and ladies, numbered about 700. The hall, galleries and staircases to the upper rooms were sumptuously decorated for the occasion by various well-known firms under the general direction of the Entertainment Committee, and here mention must be made of the names of Mr. Brodie and Mr. Goldsmith. The reception of the visitors by the President began at eight o'clock, and, contrary to what heretofore has been usual, the weather was fine. In the large hall where the reception took place an orchestral stage, tastefully decorated with tapestries and palms, was erected for use of the band of the Coldstream Guards, who, conducted by Mr. C. Thomas, by permission of Colonel J. B. Sterling, played during the evening pieces by Gounod, Verdi, Balfe, Schumann, Tito Mattei, Sir A. Sullivan and other composers. The entertainment also included a Séance Magique by Mr. George Bayne, which was evidently appreciated, to judge by the merriment elicited from the audience. The feature of interest in each recurring conversazione is naturally connected with the prizes won in the past session, which are on the occasion first announced, the prize drawings being at the same time on view in the upper rooms. One of the rooms was also devoted to the exhibition of a selection from the designs sent in in competition for the completion of the South Kensington Museum. The authors of the designs exhibited were Messrs. John Belcher, T. E. Collcutt, T. N. Deane, W. Emerson, T. G. Jackson, Mervyn Macartney, Aston Webb (selected design) and W. Young. Dismissing South Kensington and its buildings from the mind, the most admired exteriors were those of Messrs. Belcher, Deane and Emerson. Some rubbings of fine old brasses and a selection of works by the late J. D. Sedding, illustrated by drawings and photos, were also exhibited. The list of prize-winners was as follows :—

A. A. Travelling Studentship.—Kotaro Sakurai.

Essay Prize and Medal.—1st, W. Wonnacott ; 2nd, J. A. Pywell (special), five guineas.

Cates Prize.—H. G. Gamble.

Lectures on the History of Architecture.—1st, J. Murray, three guineas ; 2nd and 3rd, not awarded.

Lectures on Construction.—1st, W. C. Waymouth, three guineas ; 2nd, H. G. Collins, two guineas ; 3rd, A. Stretton, one guinea.

Elementary Class of Ornament.—1st, C. E. Salmon, three guineas ; 2nd, A. Stratton, two guineas.

Elementary Class of Ornament.—1st, F. A. C. Smith ; 2nd, A. W. Jarvis ; 3rd, H. Jefferis.

Class of Design.—1st, H. G. Lidstone ; 2nd, J. C. Stockdale ; 3rd, W. A. Lewis.

Class of Colour Decoration.—1st, J. P. Cooper.

Time Sketch Prize.—M. Garbutt.

Class of Construction.—1st, H. E. Mathews, three guineas ; 2nd, J. C. Stockdale, two guineas.

Advance Class of Construction.—John Murray, three guineas.

Class for the Study of Quantity Surveying and Specification Writing.—1st, J. P. Clark, three guineas ; 2nd, W. B. Parry, two guineas.

Scholarships, Session 1891-92.—For first and second years' courses of the annual value of ten guineas, tenable for two years, E. A. Rickards and A. J. Stratton. For third and fourth years' courses of the annual value of ten guineas, tenable for two years, W. C. Waymouth and C. C. Winmill.

In furnishing and decorating the hall, &c., the following firms exhibited :—Messrs. Bontor & Co., Evans & Co., Felix & Wayman, Gillow & Co., Hayward & Co., Hindley & Sons, Jeffrey & Co., W. De Morgan & Co., Morris & Co., Pitman & Sons, William Woollams & Co. The electric lighting arrangements and fittings Messrs. Strode & Co. carried out, and the current was supplied by the Westminster Electric Supply Corporation. The exhibits included beautiful specimens of wall-paper decoration, tapestries, carpets, hangings, artistic upholstery and furniture, art metalwork, &c.

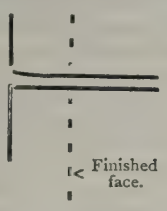
A leading feature in the arrangement of the hall was a handsome Oriental canopy erected by Messrs. Hindley & Sons in the centre of the hall, which formed an agreeable pavilion for the purposes of the reception committee. The canopy was supported by four uprights, one at each corner, and these consisted of Messrs. Hindley's well-known collection of specimen rugs, imported from various parts of Asia Minor, the seat of this ancient industry. The taste and elegance of these draperies were conspicuous, even among the many fine specimens of art workmanship exhibited. Messrs. Hindley's Indian matting was also a subject of much admiration, being displayed on the front of the gallery round the hall, and forming a very decorative frieze above the other collections on the ground-floor. In the arrangements great credit is due to the energy and taste of Messrs. Hindley's manager, Mr. Walter Purson, and also to Mr. C. A. Hindley.

The following particulars of the exhibit of Messrs. Wm. Woollams & Co. will be of interest :—No. 18,760. "Kelvin." A conventional poppy paper, printed in six transparent colours on green mica. Designed by Mr. G. F. Catchpole. No. 4,981. "Tuscan." Dado decoration in reds on a cream ground. Designed by Mr. T. W. Hay, and adapted for use in rooms or corridors, or on the rake on staircases. No. 18,768. "Asiatic." A well-arranged Indian design in bright colours on cream mica. Drawn by Mr. A. Silver. No. M 857. "Argyll." Ceiling-paper, raised white flock on blue ground. Designed by Mr. O. W. Davis for special use in rooms that are not rectangular, the pattern being free from rigid lines. No. M 813. "Pompeii." A design in rich red flocks, in which the difficulty of applying Pompeian ornament to an all-over filling has been successfully overcome by Mr. O. W. Davis.

Among various examples exhibited by Messrs. Jeffrey & Co. may be mentioned the "Cockatoo Decoration," designed by Mr. Walter Crane, a very rich pattern printed in various tones of red, forming a very pleasant harmony of warm colour. The "Strasbourg" pattern, a large conventional design by Mr. Lewis F. Day, particularly well adapted for halls and staircases. The "Lotus" pattern, designed by Mr. C. F. A. Voysey. Both of the foregoing were shown printed in coloured lacquers on a gold ground producing a very rich effect of colour. Also a large naturalistic pattern, by Miss M. Gemmell, of the chestnut blossom, in which the natural effect of the leaves and flowers has been cleverly produced; and two large damask patterns, one produced in soft tones of blue, the others in light yellows on a rich, dark yellow and gold ground.

A GLIMPSE OF GREECE.*

ONE is sometimes asked, "What am I to benefit from a visit to Greece? The time for building Greek temples is past ; that sort of thing has been tried and has not succeeded. Hadn't I better go to France, Italy or Spain, and see things more useful to me, be able to fill my notebooks with details that I can use up and make sketches of pieces of grouping that will come in handy?" Well, yes, perhaps so. If that is the only way you wish to study architecture it would be a pity to waste your time going to Greece. If you go to work thus, it is not likely that you will care about learning how the old architects worked and how they overcame their difficulties. But, if you want to try to do work that will live, then see the old buildings that have lived, that live still, and whose every stone has some silent tale to tell.†



Then you may go and sit on the Acropolis at Athens and look at the Parthenon and the Erechtheum and away and beyond the stretch of Attic plain, the range of Hymettus and the white scars of the marble quarries on the slopes of Pentelicus. You may know your "Stuart" well, have probably drawn out carefully the orders, both Greek and Roman, and can possibly give an accurate definition of such words as "peristyle," "epistyle," "echinus," but I hardly think you can have entered into the spirit of how the old Greeks worked, and you possibly go about with a vague notion that they did everything by rule, that a column had to be so many diameters high and so much between each, and given the order it was an easy matter to build a temple right away. It has never occurred to you, perhaps, that there were difficulties of all kinds in the way, that schemes were altered after they had been started then as now, there as here, or very often never carried to completion.

But when you have once had a day or two on the Athenian Acropolis your former conceptions are entirely altered. You now begin to understand for a fact that the walls and floors of the Propylæa were never finished, that to-day, after these more than two thousand years have elapsed, the rough surface of the

* An article by Mr. R. W. Schultz, published in the "A. A. Notes."

† I do not say Greek buildings only, by any means.

marble, which was never dressed down, still remains; you see that there is only a finished margin of about an inch or an inch and a half all round, and that the horizontal joints of the remainder are slightly sloped on the upper arris to prevent accidental pressure in setting and flaking off of the front edge.

Again, round the foot of the columns you observe a circle or square of dressed surface and a little channel cut between it and the edge of the step, in order to let the water run off till such a time as the general surface of the floor could be dressed down to the finished level. Then you begin to think why this was so, and you remember that the days of the Peloponnesian War were at hand, and that the money, which ought to have gone to finish this, was wanted to fight the Spartans.

Then you try perhaps to reconcile yourself to the use of the two orders simultaneously: the Ionic order—in this, its perhaps finest example—to support the great stone beams of the inner hall, and the Doric for the other porticos; and it begins to dawn upon you how fine that coffered ceiling to the hall must have been with its gold and colour as seen by the old Athenians approaching from below; and you can, from your own experience, feel how welcome must have been the stone benches, which stood along each side, after the steep ascent. As you sit on the steps your gaze wanders outwards, over the plain below and the olive wood, towards Salamis, lying close to the shore, then closer at hand; you observe more carefully the little Temple of Victory standing out on its bastion on your left hand, the shrine, as Mr. Stillman would like us to believe, of the deity of the Louvre which is known to all of us by the name of the Venus of Milo. A little further examination shows you that this building is a later addition, that originally the two flank substructure walls of the Propylæa were similar, and that this bastion was built afterwards to hold this delightful little temple.

And when you have done resting on these steps, you wander round towards this small temple, and as you go through the south hall of the Propylæa, on your way you cross the place where an earlier altar had stood, and which the builders of the Propylæa wished to remove, but the decree evidently went out against them, for we see how the plan of the hall was altered to allow it to remain. Further round behind this are the remains of the earlier Propylæa and part of the still earlier cyclopean wall of the Acropolis, built of large polygonal stones carefully fitted together.

And now we find our way back again into the great hall, with the sloping way for the chariots passing through the centre between the rows of Ionic columns, and we go through one of the five gateways, now stripped and bare, but once filled with bronze doors and linings—doors so large and heavy that they used to creak on their hinges in opening, as an ancient writer tells us—and you see before you the surface of the Acropolis, perhaps, if it is spring, covered thick with great white and yellow daisies, and beyond are the Parthenon and the Erechtheum.

As you pass out of the Propylæa by its inner portico you observe a low circular pedestal against the southmost pillar. This once supported a bronze statue of Athena as Goddess of Health. Plutarch tells a very pretty tale of how a workman fell down from the roof at this spot and was seriously injured, but the goddess appearing to Pericles in a dream, prescribed a remedy which cured the man, and so this statue was erected as a grateful thank-offering. The pedestal remains with the inscription and the holes for the feet of the statue, but the figure itself was of bronze, and so long ago has found its way to the melting-pot. Before going on let us turn round to the right and see the unfinished outside face of the wall of the Propylæa, with the large projecting nogs left on each stone in order to facilitate its carriage and fixing, and over there on that corner you observe a practical difficulty of site, a corner which would have encroached on a neighbouring sacred enclosure, and so it was corbelled out over; and here we see, too, the site of what was intended to be a large inner hall, a similar one having been proposed on the north side also, and there is the anta for the colonnade and the hole for the roof beam, but nothing further had ever been done. Whether ancient rights came in again, or whether it was want of funds, we cannot say.

And now we begin to follow up the sacred way which is formed on the rough rock, with lines cut across to give a foothold for man and beast, on each side being the sinkings cut in the rock for the rows of votive tablets and dedicatory inscriptions which lined the route; and here on the right is the entrance to a sacred enclosure with steps also cut out of the solid rock. On your left are one or two of the blocks of what was once the pedestal of the great bronze statue by Phidias of Athena Promachos, the Fighter in the Van, which was 66 feet high and overtopped the roof of the Propylæa, and which formed a striking landmark to the distant mariner, its gilded lance point glinting in the sun.

As you slowly approach the Parthenon you cannot but be struck by the beautiful roundness of line all through, no angularity or crudeness anywhere; and now the value of the slight curve to the horizontal lines, the inclination to the columns and entablature and other geometric niceties which Penrose has so carefully analysed, begin to dawn upon you. How beautiful, too, is the mellow colouring of the Pentelic marble against the blue sky.

But, before going on further, turn aside once more for a minute to examine the fragments of the entablature of the Propylæa, which are lying in the adjoining enclosure, and observe the remains of the bright colouring, red, blue, green and gold, which formerly covered it all. You wonder why the Greeks hid such a beautiful surface as that of the marble of Pentelicus with colour or covering of any kind, but you must remember that Pentelic marble was first used by them as a material of greater strength and durability than the old Poros stone which they had been content to build with in pre-Persic times, its beauty for its own sake dawning on them later. I don't think, however, that at any time they entirely discarded the use of colour on it, although they probably used it more sparingly.

We may now go on towards the Parthenon, and we take our way along the north side to the east end, passing by the Erechtheum and its Porch of the Maidens, to be seen later on. Standing where you can see the eastern portico, your imagination, perhaps, carries you back to the time when the great temple was complete in all its grandeur. It is a feast day, and on the architrave great garlands of fresh flowers are hanging down, or are wound in bands round the columns, and up that deserted way by which we have just come, the citizens are hurrying to pay their devotions at the shrine of their virgin goddess through ranks of votive tablets and bronze and marble groups of gods and heroes.

Entering, we pass to-day through no bronze gates, nor do we see in the dim light the lamps and the white-robed priestesses, and the great gold and ivory statue of the goddess, but only the ruined walls and the marble pavement, showing the marks of the Venetian bombs and the place where the statue stood. There also are the marks of the runners of the great gates still in the pavement, and round close to the edge of that slightly raised side-pavement are to be dimly traced the outlines of the internal columns. "Dimly traced," you say. "Why they are quite clear and distinct." No, these are the lines of the pillars of the Christian church, and the others are only to be seen by carefully looking for them. For we must remember that if the Parthenon was for nearly 900 years the shrine of Athena, it was for another 900 years more the shrine of another virgin, the Theotokos, the Mother of God, and that what had been the great temple of the pagan Greeks became the great church of the Athenian Christians. Almost on the spot where the lines of the doors are visible stood the great Christian altar, and projecting out into the pronaos, you can see the lines of the Christian apse, which had in its dome a beautiful representation in mosaic of the Blessed Virgin and the infant Christ. Round its sides were the seats for the priests and the throne for the bishop, an old Greek marble seat, which had been utilised for the purpose, and which is still to be seen in the museum close by. And if we walk along to the west end, where the cella wall still remains, and which contains on the outside the only part of the frieze which Lord Elgin did not walk off with, we see on the inside face, in what had been the opisthodomos of the pagan temple and the narthex of the Christian church, rows of nimbused saints painted on the marble wall; and outside, cut in or painted on the western wall and on the columns, are the records of the various bishops who occupied the See of Athens in Christian times.

Here also is the one trace of Turkish occupation which alone, on the whole Acropolis, has been left by the Greeks of to-day, who, in their desire to make their Acropolis look like what it was in the golden era of the fifth century B.C., a desire for obvious reasons impossible to be realised, have destroyed almost all the marks of succeeding history, whether Christian or Turkish. This one relic of the Turkish times is the lower part of a minaret; for after having been successively Pagan temple and Christian church the Parthenon became a Mahommedan mosque, and finally a powder-magazine, and so met its fate during the Venetian bombardment of 1687.

But before we leave the Parthenon we ought to glance at the substructure and see how the old foundations of an earlier temple were used as a basis for the present building. The earlier temple had been longer and narrower, and if we examine the extra piece added on to the width we shall see that it has been executed in quite a different manner to the other. It is curious to notice that, while the superstructure of the Parthenon of Pericles is so perfect in workmanship in every way, the piece

of foundation which was added to the careful superstructure of earlier date is curiously rough. True, it was intended to be covered up, but still the contrast is striking. To show how steep the natural Acropolis slope was, I may mention that at the north-east angle of the Parthenon the foundation rests straight on the solid rock, which was cut out level to receive it, and at the south-east angle, a distance of 120 feet, the substructure wall is 35 feet deep.

If we had time we might go on to the Erechtheum, certainly the most puzzling of all Greek temples, and try to get at some of the reasons for its curious irregularity, and admire its great beauty and grace of proportion and detail, and while we were there we might examine the part of the Acropolis wall close by, which is built of ruins of old columns and pieces of old entablature from one of the early temples destroyed by the Persians, and which was evidently run up in a hurry in order to be ready for the expected advance of an enemy. Then there is the museum to explore, with its array of archaic statues bearing remains of colouring on their carved draperies, its great sculptured pediments of early temples recently dug up, its large collection of archaic architectural fragments, and a thousand and one other things all full of interest and worthy of study. But it is impossible in a short paper to go further. Perhaps on another occasion I may have some more to say about the old Greeks, but better still, far better, go and see their great works for yourselves in their own clear Athenian atmosphere, and not only see them, but study them stone by stone, and if you go about it in the true way you will carry the impress of their teaching with you from that time onwards.

THE LATE VINCENT VELA.

THE death is announced of Vincent Vela, the Italian sculptor, who expired at Lignoretto, in the canton of Ticino, in his seventieth year. He was the son of poor peasants, and was born at Lignoretto in the year 1822. At the age of twelve he was employed in a stone quarry, but soon manifested a great aptitude for sculpture. Through the aid of friends he was sent to Milan in 1836, where he was employed in the works for the restoration of the cathedral. He studied the art of design with great ardour, and was placed with the sculptor Cacciatori. Being needy, he was often obliged to work through the night in making models for the goldsmiths. In 1848 he took part in the sculpture competition at Venice and carried off the prize, his subject being a bas-relief, *Christ restoring the Daughter of Jairus*. Vela had already executed several important busts when his statue of *Prayer* achieved for him a wide reputation. He proceeded to Rome, where he modelled his *Spartacus*, but, being of Swiss origin, he was recalled almost immediately to the Ticino, to take part in the war of the Sunderbund. In 1848 he assisted as a volunteer in the war of Italian Independence, and distinguished himself at the siege of Peschiera. On the conclusion of the campaign he returned to his studio and executed his noble statue of *Spartacus*. This work, which was acquired by the Duke Antonio Litta, attracted great attention at the Paris Exhibition of 1855. Named a member of the Academy of Fine Arts at Milan, Signor Vela declined this title, and proceeded to Turin, where he executed several statues, including those of *Hope* and *Resignation*. At Bergamos he finished his *Harmony in Tears* for the monument to Donizetti. At the Paris Salon of 1863 he exhibited a group in marble, *France and Italy*, which was presented by the ladies of Milan to the Empress Eugénie, and earned for the artist the decoration of the Legion of Honour. Many of his other works were also exhibited in Paris, where he obtained a first medal in 1867.

CHURCH BUILDING AND RESTORATION.

Carshalton.—The foundation-stone of a new chancel in All Saints Church, Carshalton, has been laid by the Duchess of Albany. The work was rendered necessary by the insecure and decayed condition of a large portion of the fabric of the church. By the proposed enlargement the seating capacity will be doubled, the church at present accommodating 500 persons. The estimated cost is 10,000*l.* Sir Arthur Blomfield, A.R.A., is the architect.

Oldbury.—The foundation-stones of a new church have been laid. The church will consist of a nave, chancel, organ-chamber and vestry. Messrs. Wood & Kendrick, West Bromwich, are the architects, and Mr. Willcock, of Wolverhampton, the builder.

Leeds.—The foundation-stone of the memorial church, St. Aidan's, at Roundhay Road, has been laid. The church, which will be of the Basilican type, will be constructed from plans prepared by Messrs. Johnson & Crawford-Hick, architects, Newcastle-on-Tyne and York. It will be built of red brick, with stone dressings, and the whole of the external architectural adornment will be at the west end. The nave will be 152 feet long and 40 feet wide, the aisles 11 feet, and the total width will be 67 feet.

Cardiff.—The completion of St. Catherine's Church, Canton, including a large chancel and choir, south chancel, aisle, organ-chamber and vestries, is about to be commenced. Plans have been approved of and tenders received, so that this long-looked-for improvement is about to become a reality. The architects are Messrs. Kempson & Fowler, Llandaff.

Fenton.—To celebrate the jubilee of the parish church at Fenton it was decided in 1889 to rebuild the structure. The designs for the new church were prepared by Mr. C. Lynam, of Stoke-on-Trent, diocesan surveyor. The work has been successfully carried out. The new church consists of nave and six bays, with clerestory and aisles and north and south porches; a chancel, with a chapel on the south side and a clergy-vestry on the north; also a north transept, containing a choir-vestry and an organ-chamber. A tower is designed for the west end of the nave, and the foundations for it have been put in. The church will accommodate about 1,000 worshippers. The walls throughout are of brickwork, with facing of the same material, except that the interior of the chancel is of stone. All the dressings are of Hollington and Wall Grange stone. The style of the church is what is known as Decorated. The cost of the building, exclusive of the tower, will exceed 6,000*l.* Messrs. H. & R. Inskip, of Longton, were the contractors.

GENERAL.

The Sixth Annual Exhibition of original paintings in oil and water-colour by members of the Southampton Art Society has just been opened.

Lord Rosebery has promised 1,000*l.* towards a park or recreation-ground for the town of Epsom.

An Oak Chancel Arch, supported by angels, and which was designed by Mr. Fellowes Prynne, has been erected in the church of St. Austell.

Mr. Louis Fagan, of the Department of Prints, British Museum, will deliver a course of three lectures on the art of engraving at St. George's Hall, Langham Place, on the evenings of Tuesdays, the 20th and 27th, and November 3. The lectures treat:—(1) Of line engraving; Early English school, Strange, Woollett and Sharp. (2) Etching; Rembrandt, Méryon, Jacquemart and Whistler. (3) Mezzotint; specially as applied to the representation of types of English female beauty portrayed by Reynolds.

Mr. Burke Downing, A.R.I.B.A., asks us to state that he has removed from 26 Craven Street to 175 Strand, W.C.

Sir Spencer Ponsonby-Fane, K.C.B., has during the past few weeks made his usual inspection of the theatres under the Lord Chamberlain's jurisdiction. He was professionally assisted by Mr. Frank T. Verity, son and partner of the late Mr. Thomas Verity, who for many years filled the post of surveyor of theatres to the Lord Chamberlain.

A Partnership has been entered into by Mr. Arthur H. Mackmurdo, Mr. George Hornblower and Mr. E. Stanley Walters, architects, under the style of Mackmurdo, Hornblower & Walters. Their places of business are 94 Charlotte Street, Fitzroy Square, W., and 15 Lord Street, Liverpool.

The Old Monastery Church at Edington has been re-opened after restoration by Mr. Ponting, diocesan architect.

Mr. H. O'Connor read a paper at the meeting of the Society of Engineers on Monday evening, Mr. W. N. Colam, president, in the chair, on "Retort Charging and Discharging Machinery for Gasworks."

The Bridge over the Kelvin at the Great Western Road, Glasgow, which has been constructed at a cost of 45,000*l.*, has been formally opened for traffic by the Lord Provost of Glasgow.

We are requested to state that Messrs. Lumleys, the well-known firm of auctioneers, of 22 St. James's Street, London, S.W., who have carried on business for the last thirty-eight years at that address, have no connection with a firm of a somewhat similar name who have lately opened in the same street.

The Benchers of Lincoln's Inn are having the piece of open ground in Old Square, on the north side of Lincoln's Inn Chapel, converted into a grass plot, which will be enclosed with handsome iron railings.

A South Transept is to be erected at Holy Trinity Church, Oswestry, by Miss Longueville, as a memorial to her late father, Mr. T. L. Longueville, of Penylan, Oswestry, who was one of the original founders of the church, and, during his lifetime, one of its principal supporters. It is proposed to build a corresponding north transept, also as a memorial, by subscription.

The Architect.

THE WEEK.

In the competition for the Cork Court-house the design marked "Fiat Justitia" has been placed first by the assessor, "For Auld Lang Syne" is second, and "Order" is third. As the joint committee have not as yet accepted the arrangement the names of the designers are not divulged, but it is understood that Mr. W. H. Hill, of Cork, is the author of the first design, and Messrs. T. N. Deane & Son, of Dublin, are credited with the second. Mr. Drew, the assessor, says he has had no clue to the authorship of the designs.

The fourth season of the successful Architectural Association Lyric Club, which now numbers over one hundred members, will be inaugurated by a smoking concert on Friday next, the 23rd inst., at the Mona Hotel, Covent Garden, commencing at 7.30, for which occasion Mr. A. C. Bulmer Booth, the president of the club, has arranged a capital programme. Members of the Architectural Association desirous of joining the Lyric should communicate with the hon. secs., Messrs. T. Moore and J. D. Scott.

The explorations which M. Champoiseau has conducted in the island of Samothrace, in the Ægean Sea, at the expense of the French Government, may be considered as a failure. It was anticipated that some memorial of the victory or of Pelasgic or other ancient settlement would be unearthed, but all that has been met with are some fragments of sculpture belonging to the fourth and fifth centuries, which are to be handed over to the Museum in Constantinople.

The twenty-third report of the Metropolitan Wesleyan Chapel Building Fund is interesting on account of the summary in it relating to chapel building since 1733. In spite of all the enthusiasm he excited, only one Methodist chapel—in the City Road—was built in London during the life of John Wesley. In the first half of the present century there were twenty-five erected. The donation of 50,000*l.* from the late Sir Francis Lycett, and the gifts of the late Sir William McArthur helped to cause a change. Within the last thirty years about eighty-five new chapels have been erected, with Sunday-schools, lecture-halls, &c., at an outlay of not less than 650,000*l.* This result is mainly owing to the operations of the Metropolitan Church Building Fund, through which more than 200,000*l.* has been expended in the shape of grants and loans. During the past year the committee report a total income of 15,940*l.* The grants and loans have been as follows:—Brentford, 600*l.*; Wimbledon, 377*l.*; Bassein Park, Bayswater, 500*l.*; Hendon, 500*l.*; Tooting, 515*l.*; Lower Sydenham, for site, 900*l.*; Hornsey, 600*l.*; Barry Road, 175*l.*; New Barnet, 425*l.*; total amount, 4,502*l.* New chapels have been opened at Staines, Kingston-on-Thames, Enfield and Hendon, and others are in course of erection at High Barnet, Walham Green, and Upton Park, in the Canning Town circuit. Thirteen sites are held in various parts of London, and await occupation, the loans advanced on these amounting to 9,140*l.* The metropolitan districts have received financial aid in the form of loans and grants as follows:—First London district, 68,447*l.*; second London district, 75,350*l.*; third London district, 59,400*l.*; making a total advance of 203,197*l.*

Many of our readers may not be aware of the existence of the Ex Libris Society, its mission being the collection of book-plates, and, like other societies, it has a journal. The last number contains an interesting article by M. Octave Uzanne, which recalls the old story about the use of ruffles by gentlemen who are not possessors of shirts. Victor Hugo's book-plate is characteristic of the presumption of the man. Notre Dame on a dark night serves as a background to his name, and across the plate is a crooked flash of lightning inscribed "Ex Libris, Victor Hugo." But as he held himself to be omniscient his stock of books did not amount to fifty volumes, and the necessity of a book-plate is not apparent. The rules which are applicable to the lives of ordinary mortals will not, however, serve with Hugo. His countrymen have accepted him as a literary Danton, forgetting that he offered his "Notre Dame de Paris" and his Academy discourse to an *auguste roi* of Prussia as evidence of his sympathy and admiration. In fact, his Republicanism was as unreal as his library. Gambetta in many ways was like Hugo. He, too, had a book-plate which was designed by M. Legros, but nobody is able to say whether he possessed any books. Frenchmen, being fond of fame, are very anxious to have plates that will make people think well of their taste. In spite of many trials, Champfleury's plate was not brought to perfection until the owner had passed away. Another collector has had five or six varieties prepared, and M. Paillet was so dissatisfied with all those he commissioned that now he prefers to write his name with his own hand in his books, and leaves the engraved plates to be fought for by collectors. In fact, M. Uzanne doubts whether any bibliophile can be satisfied by any effort of a designer or engraver, and there is a tendency now to make the plates very small, as if to conceal defects. The English contributors have not the skill of M. Uzanne, but their communications may have more value for the initiated. The interest taken in book-plates is evident when it is found that no less than seventy new members were enrolled at the meeting on September 24.

On Saturday the fourth annual exhibition of the South Wales Art Society and Sketching Club was opened in Cardiff by Lord Windsor. His lordship, in his address, contrasted pre-Raphaelites with the modern Impressionists. The former, he said, had an object in view, and they drew the attention of English people to the fact that artists must really learn to draw and paint things as they were before they could learn to select what they should paint. The Impressionists had also a particular object in view. In many cases they also had overstated their case, and had produced pictures that to most people were unintelligible. At the same time their object had been, in contrast with the pre-Raphaelite school, to produce the personal impression of nature—the subjective view of it, if he might use a rather commonplace antithesis, instead of the objective view. The great danger of the Impressionists, he thought, was that those who followed them might be induced to take up the method as a cloak for ignorance. In drawing a thing it was very much more easy to make a smudge than to draw correctly. But this was absolutely certain, that it was only those who knew thoroughly how to draw everything that they saw who were capable of making those smudges, and leaving out what they did not want in a picture. The great value of these different schools and different methods was that it made art in this country more universal; it prevented a running into any particular groove, and it enabled the beauties of the various classes to be seen both in this country and on the Continent. From the French there was very much to learn. They had for years taught painting in a consistent manner, and the result was that most great English artists had had at one time or another to go to France to study. The result was also, he (Lord Windsor) supposed all would admit, that the French were in advance of the English. Still, it must be remembered that technical beauties were not the only thing to be aimed at. It was no use flaunting technical prowess before the public by producing a picture simply for the sake of technical qualities.

M. Christian Labouret, who was one of the best known of the architects and contractors—a class of men that are much esteemed in France—has died in Paris in his seventy-sixth year. The great work of the completion of the Louvre under Visconti and Lefuel, which realised all the credit that was anticipated from it by Napoleon III., was carried out by M. Labouret. It is needless to say his name is ignored by writers who have described his work. He also constructed the block of shops known as the Louvre, which has brought so much profit to the owners, and the Grand Hôtel, in which the style of building becomes an important factor.

ANCIENT WESTMINSTER.

THE Griffin Monument, which has replaced Temple Bar, divides Westminster from London at one point, but to most people in the Metropolis Westminster is taken to be the district that is in the neighbourhood of the Abbey and the Houses of Parliament, and in course of time it is doubtful whether the word will have any other designation. At present few would speak of the terminus as Victoria Station, Westminster, although the approach, Victoria Street, is always likely to have the name of the district associated with it in order to distinguish it from Queen Victoria Street. There is less chance of Hanover Square, the Strand, Covent Garden, Trafalgar Square, Hyde Park being accepted hereafter as forming part of the ancient city, unless in documents where extreme accuracy is needed. If Westminster could be imagined as being sensitive, it would not suffer much by the narrowing of its boundaries. The fact is that few cities in England have undergone more changes, for it has been undergoing enlargements and restrictions for nearly a thousand years.

The first attempt to define the boundaries so far as is known was made by King Eadgar. In a charter, dated A.D. 951, the outer line of Westminster was said to be "First up from Thames, along Merfleet to Pollen-stock; so on to Bulinga Fen; afterwards along the old ditch to Cowford; thence up along Tyburn to the broad military road; thence along the road to St. Andrew's Church; next within London Fen south to mid-stream of Thames, and along the stream to Merfleet." The genuineness of the document has been often doubted, and the points marking the boundary formed the subject of many a dispute. But the Abbots of Westminster relied on the charter of Eadgar when they claimed jurisdiction over the district which extended to Ludgate Hill on one side, and may be said to have been bounded by Holborn and Oxford Street on the north, and on the west by a line drawn from Bond Street to the spot where Buckingham Palace now stands, and thence southwards to the Thames, near Vauxhall Bridge and Grosvenor Road. Mr. Loftie, who has given attention to the subject when writing of early Westminster, says:—

> The great manor of St. Peter formed after the time of the Confessor the parish of St. Margaret. It extended eastward from Milbank to the Fleet, and northward from the Thames to the ancient highway which we know as Oxford Street. Notwithstanding the size of this immense district, which comprises now the site of the largest and most populous city in the world, its value must have been but small, and until the twelfth century, at least, the greater part of it lay empty and open. At that time the bishop's estate at Stepney, and the canon's estate in Shoreditch, were already being rapidly colonised and but little of the modern Westminster had permanently emerged from the Thames. The date of the foundation of the Abbey is involved in doubt, as is that of the grant of the land adjoining it. A very early but, it is nearly certain, a forged document is quoted by all the authorities defining the boundaries in 951 under Eadgar. But the difficulties in the way of its acceptance as contemporary evidence are insuperable; and, so far, I have not found any unquestionable evidence that Westminster Abbey was in existence before the Danish conquest. The comparative unimportance of its estate, the boundaries of which were certainly doubtful as late as 1222; the remoteness of its other Middlesex manors, and the evident difficulties which Edward the Confessor encountered in obtaining for it an adequate endowment, as may be seen in the number and tone of the charters, genuine or fictitious, which were produced by the Abbey at the time of the refoundation by Henry III., as well as the protracted, but historically instructive, controversies with the neighbouring city of London to which they led, are almost sufficient in themselves to prove that St. Paul's is far older as an endowed foundation; and this view is partially confirmed by the name of the West Minster, which goes to show that before the Abbey was generally known among the people, another minster was in existence to the eastward. The early history of the royal abbey has still to be unravelled. The absence of any local name, unless that of Thorney be accepted, the existence of a king's house, the recent discovery of Roman remains in the church—these and many other points, which seem to be incompatible with any of the received theories, must be cleared up before we know as much about the origin and growth of Westminster as we do even about the origin and growth of St. Paul's.

The year 1222, which is referred to by Mr. Loftie, has some importance, because then the long suit between the monks of the Abbey and the Bishop of London, respecting the freedom of the former from the episcopal control, came to an end. According to Widmore, "the precinct of the Abbey and the whole parish of St. Margaret, at that time larger than at present, were declared exempt from the bishops of London and made a peculiar jurisdiction." It was necessary to fix the boundaries of the exempted region. On the western side, where the ground was of no importance, the boundary that was supposed to be described in Eadgar's charter as running through Bulinga Fen or Tothill Fields to Cowford, was allowed to remain. The northern boundary was also admitted in part, but instead of continuing along Holborn to Farringdon Street, it stopped at the garden of St. Giles's Hospital or the end of High Street. On the eastern side the boundary crossed Soho, went north of Long Acre, thence through part of Drury Lane to the Strand, exempting the Savoy district. The Strand churches would appear to be associated with the Abbey, for in a deed of 1393 the Abbot is described as being seized of "the manor of Westminster in the town of Westminster and in the parish of St. Martin-in-the-Fields, the Blessed Mary of the Strand and St. Clement Danes, without and near to Temple Bar." The history of the Strand parishes is, however, no less obscure than that of the Abbey. It is supposed that originally St. Mary-le-Strand and the church in the Precinct of the Savoy formed part of the parish of St. Clement Danes. That the parish belonged to Westminster seems to be evident from the circumstance that William the Conqueror insisted upon its restoration to the Abbey after it had been unjustly seized by one of his officers. But in the reign of Henry II. it was made over to the Templars, and probably was not then part of the abbatial estate.

The second Richard was not the last monarch who was obliged to consider the limits of Westminster. In 1604 James I. granted letters patent, by which it was extended, and practically became the district which has been known of late as Westminster. A large addition was made on the western side by which the sites of Mayfair and Belgravia were taken in, as well as Hyde Park and Kensington Gardens, with part of Brompton. Perhaps it would be more correct to say that in 1604 an outer district, which was always attached to the Abbey, was made to have more of a metropolitan character. The decree of 1222 mentioned certain lands "beyond these beforementioned bounds, the districts of Knightsbridge, Westburne, Padynton, with its chapel and their appurtenances," which belonged to the parish of St. Margaret.

A great part of this land belonged to the Manor of Eia, which, according to Domesday, was held by Geoffrey de Mandeville, who took part in the battle of Hastings. He was buried in the cloisters of Westminster Abbey, and bequeathed his manor to the monks. It was afterwards divided into three smaller manors, called Neyte, Eubery and Hyde. Attached to Neyte was a manor-house, and, by permission of the Abbot of Westminster, it was occupied about 1386 by the Duke of Lancaster. The manor of Hyde was enclosed as "a park, walled and environed by brick and stone," by Henry VIII. about 1536. Eubery is commemorated by Ebury Street in Pimlico.

In the course of the changes, the parish of St. Martin's-in-the-Fields was enlarged at the expense of the old parish of St. Margaret's. It is remarkable, however, that the division between them was not defined until the reign of Henry VIII. He defined St. Margaret's as the scene of the abbots' jurisdiction, while in St. Martin's were their properties. In 1535 it was decreed that the inhabitants dwelling from the new gate should henceforth consider themselves as parishioners of St. Martin's. According to Sir Christopher Wren, the new gate was one in King Street, which was very near the Abbey.

THE RIVER, FROM THE CUSTOM HOUSE TO RICHMOND; OR, A CHAT ABOUT SOME BRIDGES.—II.

[By a Correspondent.]

IT may be worth mentioning, in connection with Westminster Bridge, that the writer well remembers being conducted over it by its clever designer, the late Mr. Page, C.E., before the superstructure was finished. There were small, thin iron plates, hollowed out on the under side, and above them pieces of cork, over which something of a bituminous nature was poured, as the foundation, so to

speak, for the roadway. This excited the astonishment, not only of the writer, but of an eminent architect, since gone to his long rest, who was present on the occasion. It was not the only novelty, as the paving for the foot-passengers was formed of large cream-coloured terra-cotta tiles laid diamond-wise. The substratum of the road has proved lasting, but the terra-cotta, though agreeable-looking and pleasant to walk upon, wore out into numerous hollows owing to the enormous traffic, and so was superseded by asphalte.

In continuation of the voyage up the river, and leaving Westminster Bridge behind, one comes to that very economically-constructed suspension bridge nearly opposite Lambeth Palace, which had lately to be strengthened in view of the increasing traffic on it, such as was not contemplated when it was built. To call this bridge elegant would be absurd, and the writer has often heard it termed ugly. At the same time, it honestly fulfils its purpose, and is not overlaid with superfluous ornamentation, like the railway viaduct at Ludgate Hill, which, for the purpose of comparison, except for its lesser span, may be likened to the bridges over the Thames. One of the disadvantages of this Lambeth example is that, owing to the level of the approaches, its springing is low, which is noticed on the Albert Embankment side particularly, where the footpath has to be dropped in order to secure headway under the bridge. This certainly destroys the dignity of the structure, and makes the thoughtless passenger murmur, "This is cheap and nasty!". Now the writer, following out the opinions expressed at the commencement of this article, maintains that this bridge fulfils all the true principles of architecture, and only falls a little short of the beautiful. The balustrading is just what it should be to suit the material, a kind of latticework with no affectation about it, for most of the Thames iron bridges are a failure in this respect. The suspension-rods from the chains come in naturally, and the cantilevers to support the footpaths are of the simplest description. In fact, one may say, not a penny has been spent on decorative work. It is in the upper part of the piers where the want of a little relief is felt, for it must be acknowledged they are remarkably plain. Beneath the roadway, as in several of the suspension bridges, there are two cylinders, placed transversely, of course.

Vauxhall Bridge is plain enough and not beautiful. But it has the merit of fulfilling its purpose, and all its details are treated in a straightforward way, simple as they are. The niches in the massive granite piers, against which the arched iron construction abuts so comfortably, would look all the better were they filled with figures. But, then, everyone who knows anything about our public buildings in London is well aware that "the exception proves the rule" in this matter, though there is one very notable instance to the contrary, for, wonderful to relate, the Burlington Street façade of the University of London was actually supplied with all its statuary at the time it was erected. The writer made a mental note of it then on account of the singularity of the occurrence; *vide* the contrary at the Foreign Office and St. Mary-le-Strand, not to mention numerous other tenantless receptacles for sculpture in our great city. The balustrade, as is the case with nearly all these iron bridges, is rather a failure, and looks too high to be in good proportion, besides being very formal. It is certainly much easier to treat a masonry parapet successfully, whether solid or perforated, than one of iron, as is apparent by what has been said. It is but "telling a twice-told tale" to say that the newer bridges lose some of their effect by the rise of the roadway in the centre being so slight. At Vauxhall there is a good bold arched outline which horses do not like, but many human beings do. The perforated spandrils have vertically-arranged pierced panels, semicircular headed.

The railway, or Victoria Bridge, at the eastern end of Battersea Park, has been previously alluded to. It is an excellent specimen of design, though so plain, the spandrils of arched iron construction having perforated latticework very like the other iron bridges.

The Albert Suspension Bridge, though near, is fortunately sufficiently far away from the example just mentioned to enable the spectator to judge of its merits without finding its neighbour too much diverting one's attention. There is originality and elegance in this Albert Bridge, but it is a pity the ornament is not of a purer or more pronounced character. A good deal of the popular freely-treated Renaissance ornament is not quite acceptable to the writer, possibly because he is too old-fashioned to move with the times; but, at any rate, there is a distinction between meaningless decoration and that which appeals successfully to the educated eye. There is much to examine in this structure, specially in the piers, or series of piers, which cannot be described by one stroke of the pen. The planning is really good, and the engineers have struck out a line of their own in regard to these features. Instead of one continuous pier, transversely, there are two, with a bold arch connecting the one with the other. It seems to the writer that it is in the turrets or piers of these Thames suspension bridges where iron, speaking from an architectural point of view, fails. In the old Hungerford Bridge there were towers of masonry, not very massive in construction, but sufficient to carry the great weight of the chains. In iron, whether cast or wrought, it is extremely difficult to treat these important features in a satisfactory manner, and the writer can feel for civil engineers therein. Iron, at any rate for the sub-aqueous foundations, does not take up so much room as brickwork or masonry, which is a constructional advantage. The projections on a circular plan in front of the piers add much to the picturesque effect, and the simple iron latticework to the parapet of the bridge is on the right principle. It acts as a foil to the rich ornamental work in the rest of the bridge, which would have been overdone had much decoration been applied there. The suspension-rods from the great chains are vertical, which has a better appearance than the way in which they are disposed in the Battersea Bridge. The picturesquely-treated pair of lodges at each approach to the bridge add much to its dignity. Taking it altogether, this is a noble and elegant structure, displaying considerable novelty in its design, every detail having been well thought out. It is certainly one of the handsomest bridges on the Thames.

The Battersea Suspension Bridge is a great contrast in many ways to the example just commented upon. There is, in fact, hardly a point in common between the two. For instance, the lofty iron piers are of much more slender proportions and placed outside the roadway, and are also disconnected beneath. The roadway is really almost independent of the piers as a matter of design, it only resting on them sufficiently for constructional purposes. There is much ingenuity in the manner in which these piers are broken up on plan by clusters of pillar-like features. But though no doubt superabundant in point of strength, they have a rather flimsy effect. That is one of the disadvantages of the material, and it would be absurd to go to the great extra expense of more substance merely for appearance. The central span of this bridge is very considerable, the side spans being less as compared with other structures on the suspension principle. But what distinguishes this bridge so much from all others is the employment of braces set diagonally at different angles from the chains down to the balustrade, in addition to the ordinary suspension-rods. These, of course, are in a different plane to the latter, and secured by ornamental bolt-heads outside the roadway balustrade, which is quite plain and unperforated, consequently looking somewhat heavy. Constructionally this is decidedly a very interesting bridge to examine, but from an artistic point of view the braces at various inclinations have a confusing appearance in perspective, and are puzzling until a closer inspection solves the mystery of their planning.

The new Chelsea Bridge has an effective rise in the centre, but the harsh contrast between the grey granite and the iron arches painted green is not pleasing. However, the paint part can easily be altered if necessary, for paint, like beauty is reported to be, "is but skin deep." What strikes the spectator a little way off, and is difficult at first to realise, is the presence of a large *cavetto* moulding, slightly ornamented in low relief, on the face of the iron-arched construction next the soffite. It might, in other words, be called a cove, but then no one expects that in such a position, which misleads the traveller somewhat. The writer does not know any such feature in other bridges, and cannot say that he considers it quite successful. The management of the spandrils to this bridge is also unlike the others where iron is employed, for in the

Chelsea Bridge there are no perforations, but, instead, some non-geometrical ornamentation in relief. There can be no question that this is by no means so effective as the plain lattice-like piercing, and looks dull and heavy. The parapet to the bridge is perforated—an arcade of semicircular character carried on shafts. For some reason or other the raking lines of the piers, where there are mouldings, disturb the eye in this example, though in other bridges the same thing occurs, as was remarked upon in No. I. of this article. However, as a whole, this is a handsome substantial-looking structure.

Pursuing one's course up the river, the next bridge arrived at belongs to the South-Western Railway, between the Chelsea and Battersea Stations. It is of much the same type as the Victoria Railway Bridge, having been built before the more recent and very ugly lattice-girder kind, carried on iron cylinders, came into use. This bridge has plain perforated spandrils and a balustrade of simple lattice-work description. It is, in a word, commonplace; but having nothing about it to offend the eye or form a blot on a fair landscape, as unfortunately is the case with the prevalent type of railway viaduct or bridge. For example, the two next bridges further up stream, though superior specimens of their class, the first one a road bridge, the next for the steam-horse, do not possess the charm of the massive structure a little beyond. But it is better not to anticipate. Wandsworth Bridge might easily be mistaken for a railway-bridge, owing to its general construction, were it not for the considerable rise in the centre. It cannot be called beautiful, for it is too utilitarian looking, and great lattice girders resting upon cylinders, even though the latter be covered with handsome capitals, will never compensate for the absence of the arch. It is true that in the case of suspension bridges the under arch is missing, but then there is the graceful contour of the chains, the concave line at the top next the sky, instead of the convex underneath the roadway. The writer, when first he visited Rome some years since, was amazed at the grand effect of the long series of columns in some of the early basilican churches, carrying no arches, but with flat lintel construction over them. The secret of this was in the fact that the piers were very close together, whereas where iron is employed the supports can be very much farther apart, which results in that stiff, square appearance. The attempt to get over this by elaborate brackets, as at the Ludgate Hill railway viaduct, is a failure, artistically speaking, because such seem out of place in the construction. On the Metropolitan Railway Extension, between Rickmansworth and Chesham, how much the picturesque scenery is marred by the terribly ugly viaducts over the old country roads, where, in many cases, the abutments are coated with Portland cement which carry iron girders! How one sighs for the ancient arch, whether of the commonest brick or rough local stone! This seems a rather long digression from the bridges over the Thames, but the same principle applies necessarily, to some extent, on *terra firma* as on the running waters.

(*To be continued.*)

A FRENCH VIEW OF ART IN ENGLAND.

A REPORT has been prepared by M. O. Fedière, for a long time attached to the Luxembourg Museum, who was recently despatched by the French Minister of Public Instruction to make a study of the question of Government aid to art in Great Britain.

It is difficult, if not impossible, he says, to establish a parallel between the English and French systems of encouraging the fine arts by means of national aid. The French system, established immediately after the Revolution, possesses a homogeneity and freedom vainly sought for in England, where the fine arts are subjected to the restrictions of certain traditions, some of which are obsolete, being indeed of Mediæval origin. Furthermore, whereas in France the State claims all the institutions, the English Government abandons willingly everything that might be left to private enterprise. Consequently, in England there exists no minister of fine arts, nor a minister of public instruction, properly so called. This does not mean however, that the English Government takes no interest in these institutions; but, on the contrary, art and education are the objects of special solicitude, and their fostering gives employment to a large number of persons. In order to control in a measure the development of the fine arts, since there is no special ministerial department, the plan of placing them under the control of a private committee is adopted. In this way there exists a committee forming a court of appeal called "The Judicial Committee of the Privy Council," another of commerce styled "Board of Trade," and finally a committee which presides over education and the fine arts, to which the name of "Committee of Council on Education" is given. The head of these committees is officially the president, but the real head is the vice-president of the council. All questions relating to education and the fine arts are referred to him. He is assisted by a central administration, sitting permanently in London. This administration is subdivided into two great sections or departments, of which one presides over education and the other over sciences and arts. This latter is called "The Science and Art Department." This Department has under its direction the elementary schools of sciences and art, the mining and geological schools, the South Kensington Museum, and certain other establishments which owe their existence to the Government. But the British Museum and the National Gallery enjoy a certain autonomy, and are controlled by special committees.

The *rôle* of the Government in respect to these institutions is limited to grants of money, which, however, are very insufficient. The expenses provided for by the budget of 1890–91 amount to 474,896*l.*, distributed as follows:—

Central administration	£29,059
Salary of professors of sciences	113,072
Salary of professors of arts	47,432
Expenses common to both Departments ...	60,907
Grants to students	58,912
Grants to museums	86,714
Grants to schools of science and art	78,800
Total	474,896

In this sum the amounts allotted to the British Museum and the National Gallery are not included, as well as to some other independent institutions, and consequently these subsidies may be added:—

British Museum...	£155,145
National Gallery	14,594
Gallery of National Portraits	2,209
Grant to Royal Academy of Music	500
Grant to Irish Academy	500
Total	172,948

The head of the department is an officer who bears the title of secretary, and whose salary amounts to 1,500*l.* a year. The director of the arts division has 925*l.*, while there are forty-four clerks receiving salaries amounting in the aggregate to 8,186*l.* This Department regulates questions relative to (1) the teaching of fine arts (schools of fine arts, Roman school (!), school of design, &c.); (2) exhibition manufactories, purchase of pictures for the National Gallery, grants to theatres, &c.; (3) museums and historical monuments.

Schools of Fine Arts.

The State, except in the case of primary artistic education, leaves to private initiative the care of forming painters, sculptors and musicians, and the only school is that of the Royal Academy, which is a private society. The State gives no grants to theatres, nor does it organise any artistic exhibitions; but the importance of those undertaken by private societies each year has been such as to deserve the term of national institutions, the principal of which are the Royal Academy Exhibition, the Royal Society of Water-Colours, the Institute of Water-Colours, the British Society of Arts. Each of these societies has two exhibitions yearly—one in winter, the other in summer. The society bears the expenses of its own exhibitions, and receives a percentage on every picture sold. Besides these societies, there are commercial societies which organise with a good deal of success annual exhibitions, such as the Grosvenor Gallery and the New Gallery. Both of these societies have rendered good services to art in allowing artists of slight fame to expose their works. None of these exhibitions give prizes, and the State does not buy the productions of living artists. The Royal Academy possesses a fund for the purchase of modern pictures. This fund was placed at its disposal by the celebrated sculptor Chantrey, who in dying decided that his fortune, exceeding 100,000*l.*, should go to the Academy after the decease of his widow, in order to buy each year a picture from an English or foreign artist, provided that the said picture was executed in England.

Preservation of Works of Art.

In the case of museums England need not be jealous of other countries. The National Gallery, the British Museum and the South Kensington Museum are too well known to require any comment of praise.

The British Museum.—The British Museum dates from the second half of the last century. About that time a doctor, Sir Hans Sloane, lived in London, and at his death he bequeathed to the State a rare collection of books, curiosities of a varied

nature, and a whole roomful of natural history. He died in 1753, and the State accepted the gift, and Parliament passed an Act authorising the acquisition of this collection, as well as that of manuscripts formed by Robert Halley, and the library of Sir John Cotton. A national collection was thus at once formed, but a place to put it in was required. A second time Parliament was appealed to, with the result that a lottery was organised to defray the expenses of the site of the present Museum. From this moment gifts flowed in and legacies were left, so that in 1843 the Museum had to be enlarged to its present proportions. The British Museum is divided into the following departments :—(1) Books, (2) plans and charts, (3) manuscripts, (4) Oriental manuscripts, (5) designs and impressions, (6) Egyptian and Assyrian antiquities, (7) Roman and Grecian antiquities, (8) British and Middle Age antiquities, (9) coin, medals and natural history. The Museum is administered by a committee of fifty trustees, of whom one is appointed by the Queen.

Royal Academy of Arts.—The Royal Academy was founded within the reign of George III. in 1768. In the month of November of that year a number of artists addressed a petition to the king, asking his support for the creation of an institution to encourage art and design. A month later the king approved the petition by founding the Royal Academy, which from that time has been administered with increasing success. Its aim is to give gratuitously tuition in painting, design and architecture, and to organise an annual exhibition in London. Its revenue is derived solely from these exhibitions, which are much patronised by the public. The society is composed of forty academicians, who elect amongst themselves each year a committee of ten for the control of the institution. Each member must, within six months after his election, present to the Academy one of his productions. The members form the jury for the admission or refusal of works to their exhibitions and distribute no prizes. The only privilege which the exhibitor enjoys is that of free entry to the exhibition and to the lectures at the school. For the public the admission is one shilling.

The School of Art of the Royal Academy.—For the teaching of the fine arts properly called, there is in England but one school, that of the Royal Academy. This school was founded in 1768, and has a class for the study of antique models, a preliminary class of painting, a high class of painting, a class for the study of the nude, a class of sculpture from living models and a class of architecture. An art library is open to students, and each year a course of lectures is given by competent professors. During the first three years of study the students are obliged to follow these lectures. Before being admitted to the school the candidate must furnish a specimen of his capabilities. The instruction given in the classes is absolutely gratuitous, the students being only asked to furnish what instruments they require.

The National Gallery.—The National Gallery was founded in 1824. In that year the Government bought, for the sum of 57,000*l.*, the collection of a rich banker, consisting of thirty-eight pictures by the old masters. This was the beginning of the superb museum so much valued to-day. Two years later Sir G. Beaumont presented to the Gallery fifteen pictures of great value. The example was rapidly followed by others, and soon funds were voted by the Government for the purchase of paintings, and, when these funds were insufficient, private persons came to the relief of the Gallery. It was thus that a picture costing 55,000*l.* desired for the Gallery was obtained when the Government refused to offer more than 24,000*l.* Three gentlemen promptly gave 10,000*l.* each and the treasure was secured. The National Gallery was at first situated in Pall Mall, but in 1828 the present building was constructed at a cost of 200,000*l.* in Trafalgar Square. The control of the Gallery is in the hands of six trustees, who have under them a director with a salary of 1,000*l.* a year, a secretary paid 875*l.*, and a staff of thirty-six curators and employés of different ranks.

The National Portrait Gallery.—This collection, which is installed in Bethnal Green, owes its origin to Lord Stanhope, who conceived the idea of assembling in one place the authentic portraits of the most distinguished persons of the century. Sovereigns, statesmen, generals, men of letters and artists figure in this Gallery. The number of portraits exceeds 880, of which more than half were presented by private persons.

The South Kensington Museum.—This museum is one of the largest in the world. It is well organised and lends out to provincial schools many subjects of natural history or works of art.

Theatres and Singing Schools.—No theatre in the United Kingdom receives a grant from the State, nor is there any conservatory of music. However, the Royal Academy of Music replaces advantageously a conservatory. It receives an annual grant from the Queen of 500*l.* Students are required to pay 30*l.* for the session of nine months. Such is the information I was able to procure in prosecuting my inquiries, and by it may be seen that the English employés are much better paid than our own (French). The salaries for corresponding service are from 75 to 100 per cent. higher in England than in France. I find, also, that the English Government is powerfully seconded in its efforts by private subscriptions. It is to this latter source that England owes the most of its institutions of art, and it is to it that the country has recourse when a pecuniary effort is necessary. Another fact to be observed is that the administration of fine arts in England centres all its efforts in preserving works of art, paying but a secondary attention to education. England gives facility to the art student to acquire the first notions of the subject, multiplies the models in the museums destined to form his tastes, but proceeds no further. The artist is obliged to shift for himself without the hope of receiving any decoration or pecuniary encouragement, which is the reverse of the system that obtains in France.

SILCHESTER.

THE letter of Mr. W. J. St. John Hope, which appeared last week, deserves to be compared with the following speculation by the late A. J. Kempe, as to whether Silchester was the Calleva Attrebatum or the Vindonum of the Romans. He wrote :—

Until the publication of Horsley's lucid commentary on the Roman itineraries of Britain, Silchester, on the authority of Camden, had been considered the ancient Vindonum, or Vindomis ; and that station, the capital of a colony settled in Britain before its invasion by Cæsar, bearing the name of Segontiaci, who surrendered to him on his second expedition. Horsley saw reason to differ from Camden in assigning the locality of Vindonum, and placed it at Farnham (whether rightly or not is not the particular object of these remarks) ; Calleva at Silchester. Mention of this station, Calleva Attrebatum, occurs in no less than five of the Iters of Antoninus. I recapitulate the stages of the Iter, of which Silchester was one, following Horsley's appropriations for them, on the modern map.

A Regno Londinium—from Chichester to London—96 miles ; Clausentum (Old Southampton), 20 miles ; Ventam Belgarum (Winchester), 10 miles ; Callevam Attrebatum (Silchester), 22 miles ; Pontes (Old Windsor), 22 miles ; Londinium (London), 22 miles. The station Pontes, which Horsley places at Old Windsor, and for which so many different places have been assigned by the learned in Roman topography, must have been where the Roman road from London crossed the Thames at Staines. From Pontes the Roman agger pursues its course through various now unfrequented localities, to the east gate of the station at Silchester, passing in its course through the demesne of the Duke of Wellington, where it gives name to the two adjacent parochial districts, Strat-field Say and Strat-field Turges ; but the line of road presents no place for the chief city of the Attrebates until it arrives at the walls of Silchester. Is this, then, really the Calleva Attrebatum? The distance between Pontes and Calleva, according to the Itinerary, is 22 miles ; by a Survey, the distance between Staines and Silchester is 26 ; a conformity as near as can be required, for neither the length of the Roman mile nor the mode of measuring it agreed precisely with ours.

Five times, I have said, is Calleva mentioned in the Itinerary as traversed by the Roman line of march from various directions ; not less than four Roman roads are traceable from it at this day. But the strongest proof that it was really the ancient Calleva may, after all, be found in the circumstance that some traces of its former name are preserved in the present. Like many other ancient cities of Britain, Silchester was known by various appellations. We shall see if any of these had an identity of origin. Nennius, in his "Catalogue of British Cities," calls it Caer Segont ; perhaps merely with reference to the inhabitants of the district in which it was placed. This distinction was probably merged in the Itinerary, in its connection with the more important province of the Attrebates, on whose confines it immediately stood. Nennius tells us it was also called Murimintum, an appellation which we must consider had allusion to its wall, which, even to this day, is so strikingly characteristic of its site. The term Galleva, or Calleva, of the Roman itineraries, appears to have had the same source, and was but a softened form of the British Gual Vawr, or the Great Wall ; both names had their root, perhaps, in the Greek χάλιξ (silex), whence also the French *caillon* (a pebble). Sile-chester, or Silchester, is therefore but a Saxonising, to use the term, of Silicis Castrum, the fortress of the Flint or Wall, by the easy metonymy which I have shown. The Greek lexicographer says that χάλικες are the small stones of which buildings are constructed, "ut sunt silices," "et cementa," and cites Thucydides for authority.

Nennius ascribes the foundation of Silchester to Constantius, the son of Constantine the Great. Whatever improvements he might have made in its buildings or defences, I cannot but think it had a much earlier origin. As the chief fastness or forest stronghold of the Segontiaci, it probably existed at the time of Cæsar's expedition into Britain. The anonymous geographer

of Ravenna gives it a name which I have not yet noticed, Ard-oneon; this is a pure British compound, and may be read Ardal Onion, the region of Einion or Onion. Now it happens, by the circumstantial tenacity of tradition, that an arch or cavern in the massive walls of Silchester is called to this day Onion's Hole, and Camden bears testimony that, in his time, the numerous coins found within its limits were called Onion's pennies. These coins are chiefly, I believe, of the Lower Empire, and attest the large population of the place at that period. I cannot, however, with the venerable and judicious Camden, esteem the tradition concerning the Giant Onion altogether as a dream; doubtless he was some great chieftain of the Segontian weald, the lord of Silchester before its silicious rampire was raised, when its defences were constructed of earth and the felled trees of the surrounding woods. The form of the station shows that its original ground-plot was not Roman. Einion may, therefore, be compared to one of those beings of primeval times whom the Scripture terms "giants," a race of more bodily power than man possesses in his civilised condition, for in savage life the corporeal energies are more fully developed, to which we may add that the hardihood, temperance and exercise which must be practised in a life so destitute of luxurious indulgence induce, of necessity, no small degree of natural prowess. Thus personal strength was, in the heroic ages, a highly honourable quality.

The inscription found at Silchester in 1732, by which one Tammonius dedicated an altar to the Segontian Hercules, has confirmed the account of Nennius that it was the city of that tribe. Another, discovered at the place about the same period, shows, however, that it might claim a much earlier period of occupation by the Romans than that assigned by the above writer. This last inscription was in compliment to Julia Domna, as patroness of the Roman army and senate. She was a Syrian by birth, and second wife of the Emperor Septimius Severus.

When I visited Silchester many years since I saw at the farmhouse, just within the eastern gate, a gold coin of Domitian in the highest preservation, a bronze key-ring and other relics of the Roman age. In the yard lay some fragments of stone columns of considerable size. With these articles may be enumerated some penates of bronze and a gold ring bearing these letters :—

SE | NI | CIA | NE | VI | VA | S | II | NDE.

Of this, by comparison with a ring (an impression of which has been shown me by my friend Mr. Nichols) found at Brancaster, Norfolk, I am able to correct a former suggestion of mine and to read, I believe, the inscription rightly. The relic was, I consider, a sort of *annulus Amicitiæ*, the gift of some Christian of the Roman times to his friend Senecianus; the legend a pious aspiration, "Seneciane, vivas in Deo." In the ring was set an antique intaglio of Venus Urania; this addition was merely ornamental.

In no spot in Britain exists more striking evidence of the devastation effected by the northern barbarians on the Romano-British colonies than in the deserted area once occupied by the Segontian city. The site is left as bare and houseless as Anderida, which the fierce Ella rased to the ground in the fifth century, about which time Silchester probably underwent the same fate. The tradition of the neighbouring cottagers is that it was destroyed by wildfire attached by the besiegers to the tails of sparrows, a figure, perhaps, truly recording the main catastrophe and the fact that it underwent an assault by igneous missiles. A deep mystery, however, pervades the story of the rise and fall of Silchester.

The stupendous walls of Silchester, chiefly built of flint pebbles, have alone, of all its buildings, defied the exterminating ruin, and remain to this hour silent witnesses of the city's ancient grandeur. The soil accumulated on their surface nourishes many lofty forest oaks, singular and interesting appendages of the indestructible flinty rampire.

It may be recollected that in 1833 the remains of some magnificent baths were discovered at Silchester. Of this circumstance I sent at the time some account to the *Gentleman's Magazine*, to which communication incidental reference has occasionally in the course of discussions been made. From the same source I beg to detail one remarkable fact :—The baths at Silchester bore a corresponding similarity of arrangement with that of the ancient baths in the island of Lipari, so interestingly described by Captain Smyth. "In the *natatio*, or cold-water bath, at Silchester was found a human skeleton, and in the leaden pipe connected with the bath upwards of 200 Roman coins of brass."

The tesselated floors of the Silcestrian Thermæ were thickly strewed with wood ashes and the fragments of tiles that had formed the roof, appearances which I have noted in almost all remains of Roman edifices or villas discovered in Britain. I need not remind the antiquary how frequently charred corn is found in Roman buildings. These circumstances clearly indicate the destruction of public and private dwellings, granaries, &c., by violence and fire.

TESSERÆ.

Paintings in Churches.

In the fourteenth and fifteenth centuries painting was the ally of faith and almost on equal terms with theology. It was the embodiment, in outward symbols and in popular forms, of mysteries in their own nature abstract and incorporeal. It rendered intelligible and pathetic those touching passages from the divine history which otherwise were shut up in the Latin of the Vulgate, and made them speak to all hearts through the universally intelligible language of the eye. It had its birth in enthusiastic feeling, for few then consecrated themselves to the service of art except from a deep inward prompting and natural call to that vocation, and it generated and kept awake that enthusiastic feeling in others. It was a part of that redeeming principle of earnest faith which spread its influence, in one shape or other, over the whole course of action of the time, deep and genuine, when it existed at all, and certainly then existing in the mass of the community, though obscured and perverted; that faith which founded altars, endowed churches, gave birth to pilgrimages and penances, dictated crusades and made the whole of Christendom bend in submission before the footstool of some feeble old man as the successor of St. Peter. As the handmaid of religion, nay, as part of religion itself, painting had then a principle of existence apart from the patronage which is bestowed upon it as an instrument of luxurious ornament, or as ministering to the refined pleasures of taste. Patronage, indeed, and reward followed in its train, for under reward must be viewed not mere wealth but station in society, rank, influence, and thus the lower ambition and more vulgar cravings of artists were gratified, as well as the nobler; but the masterpieces of early art, those on which all ages have since recognised the stamp of the highest genius, had their birth in that lofty character with which painting was then invested; rendering it something of a priesthood as well as a profession, excluding the mediocrity which arises as soon as mechanical dexterity comes to be the substitute for feeling, making the artist feel his immediate influence over the public mind, and, like an actor on the stage, derive new excitement and enthusiasm from the consciousness of his power. But not merely was painting, as an instrument in the hands of religion, the means of exciting the sensibilities and elevating the mind to the conception of divinity; it was actually, in the earlier ages, a means of national education. It positively enlarged the boundaries of knowledge before the general diffusion of books by printing; it was the substitute, first for the drama, and next for books. As Lord Chatham confessed that he derived most of his acquaintance with the history of England from Shakespeare's plays, so the chief information connected with history which the people possessed during the golden era of Catholic art was derived from pictures. In them, also, as in the scenes of the drama, they could study the living play of human passions, and even where they did not communicate positive ideas, they yet exercised, by means of fancy and the excitement of the sense of beauty, an indirect influence upon the understanding; valuable, because its effect, so far as it went, was not partial but universal. In this way painting became not merely an ornamental but a useful art, a practical power in the State, to be cultivated and set in motion through the establishment of guilds and societies, as we now found schools and universities. The artist felt himself, and was felt to be, important to society as furnishing the necessaries of the mind, in the same way as the other members of those guilds and crafts did the necessaries of the body. This state of society has passed away, and we can no more expect to see the revival of painting, as it then existed, than we could hope to rebuild the ruins which time has overthrown, and call back, amidst modern civilisation, with its accompanying benefits and evils, the institutions of the fifteenth century.

Mediæval Bell-Founding.

In a "Life of Charlemagne" it is stated that in the abbey of St. Gall a monk, who greatly excelled in the art, produced a specimen of his craft, the tone of which was much admired by the Emperor. "My lord-emperor," said the monk upon this, "command a great quantity of copper to be brought to me which I will purify by fire, and let me have silver instead of tin, about a hundred pounds, and I will cast for you such a bell that the other in comparison with it shall be mute." Magius lamented that princes were more avaricious than formerly, and would no longer bestow the necessary coin to impart a silvery sound to the bells. Mr. Gatty, however, says that the widespread notion of the advantage of this ingredient is a complete mistake. "Persons," he says, "talk as familiarly of sweetening the tone of bell-metal by the introduction of a little silver as they would speak of sweetening a cup of tea or a glass of negus with a lump of sugar. This is a dream. Silver, if introduced in any large quantity, would injure the sound, being in its nature more like lead as compared with copper, and therefore incapable of producing the hard, brittle, dense and vibratory amalgam called bell-metal. There are, no question, various

little ingredients which the skilful founder employs to improve his composition, but these are the secrets of the craft and peculiar to every separate foundry." Nor is there any valid reason for supposing that our ancestors employed it any more than ourselves, except that it was a custom to cast a few tributary coins into the furnace. The composition of the amalgam in England six hundred years ago is known to us from the materials delivered in the thirty-sixth year of Henry III. for the purpose of making three bells for the church in Dover Castle, when all that was furnished was an old bell, 1,050 pounds of copper and 500 pounds of tin. The mixture was therefore made up of rather more than two parts of copper to one of tin; the modern recipe only differs from the ancient in allowing three parts of copper. The vaunted superiority of a few of the older bells over those of recent times has been ascribed by some to the influence of the atmosphere in the course of centuries; others have suggested that it was due to melting the metal by a fire of wood, which is known to improve the quality of iron, instead of by the rapid process of a blast furnace. But there is another cause which has had its share in the effect. "If the quantity of metal," says Mr. Gatty, "be not in due proportion to the calibre of the bell, the power of its tone will be lost, and only a panny, harsh, iron-like sound can be produced from it. For instance, if you try to get the note E out of a quantity of metal which is only adapted to sustain F well, the F in that case would be preferable to the E intended." Now in old bells a far larger mass of metal was allowed to a given note than is the case with us, for modern skill is necessarily directed as much to economy as excellence of manufacture. The tenor bell of Rochester Cathedral weighs 28 cwt., but its note F would be reached at present with half the metal, at an equivalent sacrifice of dignity of tone. In science and dexterity the living artificers surpass those of bygone times. By the early part of the fourteenth century a distinct class of workmen followed the trade, and the bell of Crokesden Abbey, in Staffordshire, having been fractured in 1313, Master Henry Michel, of Lichfield, was engaged with his assistants in recasting it from the Octave of the Trinity to the Feast of the Nativity of the Blessed Virgin. Notwithstanding the time bestowed upon the process, it turned out a failure, and being recommenced anew it took two months more to bring the work to a happy conclusion.

St. Mary's Abbey, York.

Little is known of the early history of this abbey. That there was a monastery on this site during the time of the Saxons appears certain; but, as the Danes repeatedly destroyed the northern monasteries, the one of St. Mary's probably shared the same fate, and the only remains that can, with any probability, have been of that period are the rough foundations of the east end of a very small church, situated where the east aisle of the south transept of the last church stood. Taking the epochs of the rebuilding of the different parts of the monastery from the remains, they will be found to divide themselves into five distinct periods, viz.:—(1) Saxon, of which the only remains are the foundations of the east end of the church, as above stated. (2) Norman, when the monastery was entirely rebuilt by Stephen, called the first abbot, under the auspices of William Rufus, who himself laid the first stone, about the year 1100. The remains are—the great gateway from Marygate, the vestibule to the chapter-house, the misericorde, the cellarer's office, the school of the monks, and the rough foundations of the north-east part of the east end of the church. (3) Early English, when the church and chapter-house were entirely rebuilt by Simon de Warwick, abbot from 1250 to 1290. The remains are part of the west front of the church, and the outer wall of the north aisle of the nave, with parts of the walls of the transept, boundary walls and foundations of the choir and chapter-house. (4) Later Gothic, about the year 1450, when the principal part of the edifice seems to have been rebuilt. The remains of this period are chiefly the school and ambulatories of the novices and of the monks, the parlour, the kitchen and its dependencies, the porter's cell, guests' hall, and a great portion of the walls and towers, and a gateway to the abbot's palace. (5) Works that appear to have been going on at the time of the dissolution, the remains of which are the water gate, porter's cell and room over.

Interior Decoration.

The entablature, as usually composed, is essentially a piece of external architecture. The frieze occupies the place of and represents the ends of the horizontal cross timbers of the roof or ceiling, and the cornice is but the overhanging extremity of the roof for the protection of the vertical face of the wall from the weather. To introduce such features within is irrational. The masters of the Greek art, so truthful in all they did, committed no such offence against propriety; nor do we find any complete internal entablature (except in the cella of hypæthral temples, where of course they are perfectly legitimate) until art had lost its youthful purity, and the original meaning of the component parts of the entablature had been lost sight of. Without going so far as to deny the applicability of these regular orders to the interior of great halls, or other large interior areas, they are at all events inapplicable to the ordinary purposes of interior designs, or in rooms of moderate capacity. This dogma carried out to its full limit would no doubt extend to the condemnation of labels over interior arches, inasmuch as they are but an overhanging weathering or drip-stone; to the condemnation also of internal battlements and other features exclusively belonging to external architecture. Nor can they be defended, except on the ground that the practice of these solecisms prevailed during the most admired epochs of art. Before paper and paint had usurped their undivided dominion over the decorators of our apartments, many means of internal mural decoration were resorted to—means, it may be, more costly, but certainly more tasteful and more worthy of the character of art. Tyre supplied its rich drapery to embellish the walls of Roman buildings; and, following in the steps of Egypt, Assyria and Greece, the artists of Rome loved to depict the fairest forms and most brilliant conceptions over the walls and vaulting of their apartments. Inspired by the examples of eastern art, the founders of ecclesiastical architecture encrusted their walls with mosaics and painting. The looms of the east also enabled them to clothe their walls with the richest hangings—rivalled afterwards by the weavers of France, of Flanders and of England. But the general demand for economical decoration in latter times has created whole branches of mechanical manufacture to supply the place and mock the semblance of more durable, solid and real enrichment. Costly hangings are represented by fabrics manufactured daily by the mile, and the most precious woods and rich marbles are reproduced by the simple process of the paint-brush and varnish-pot.

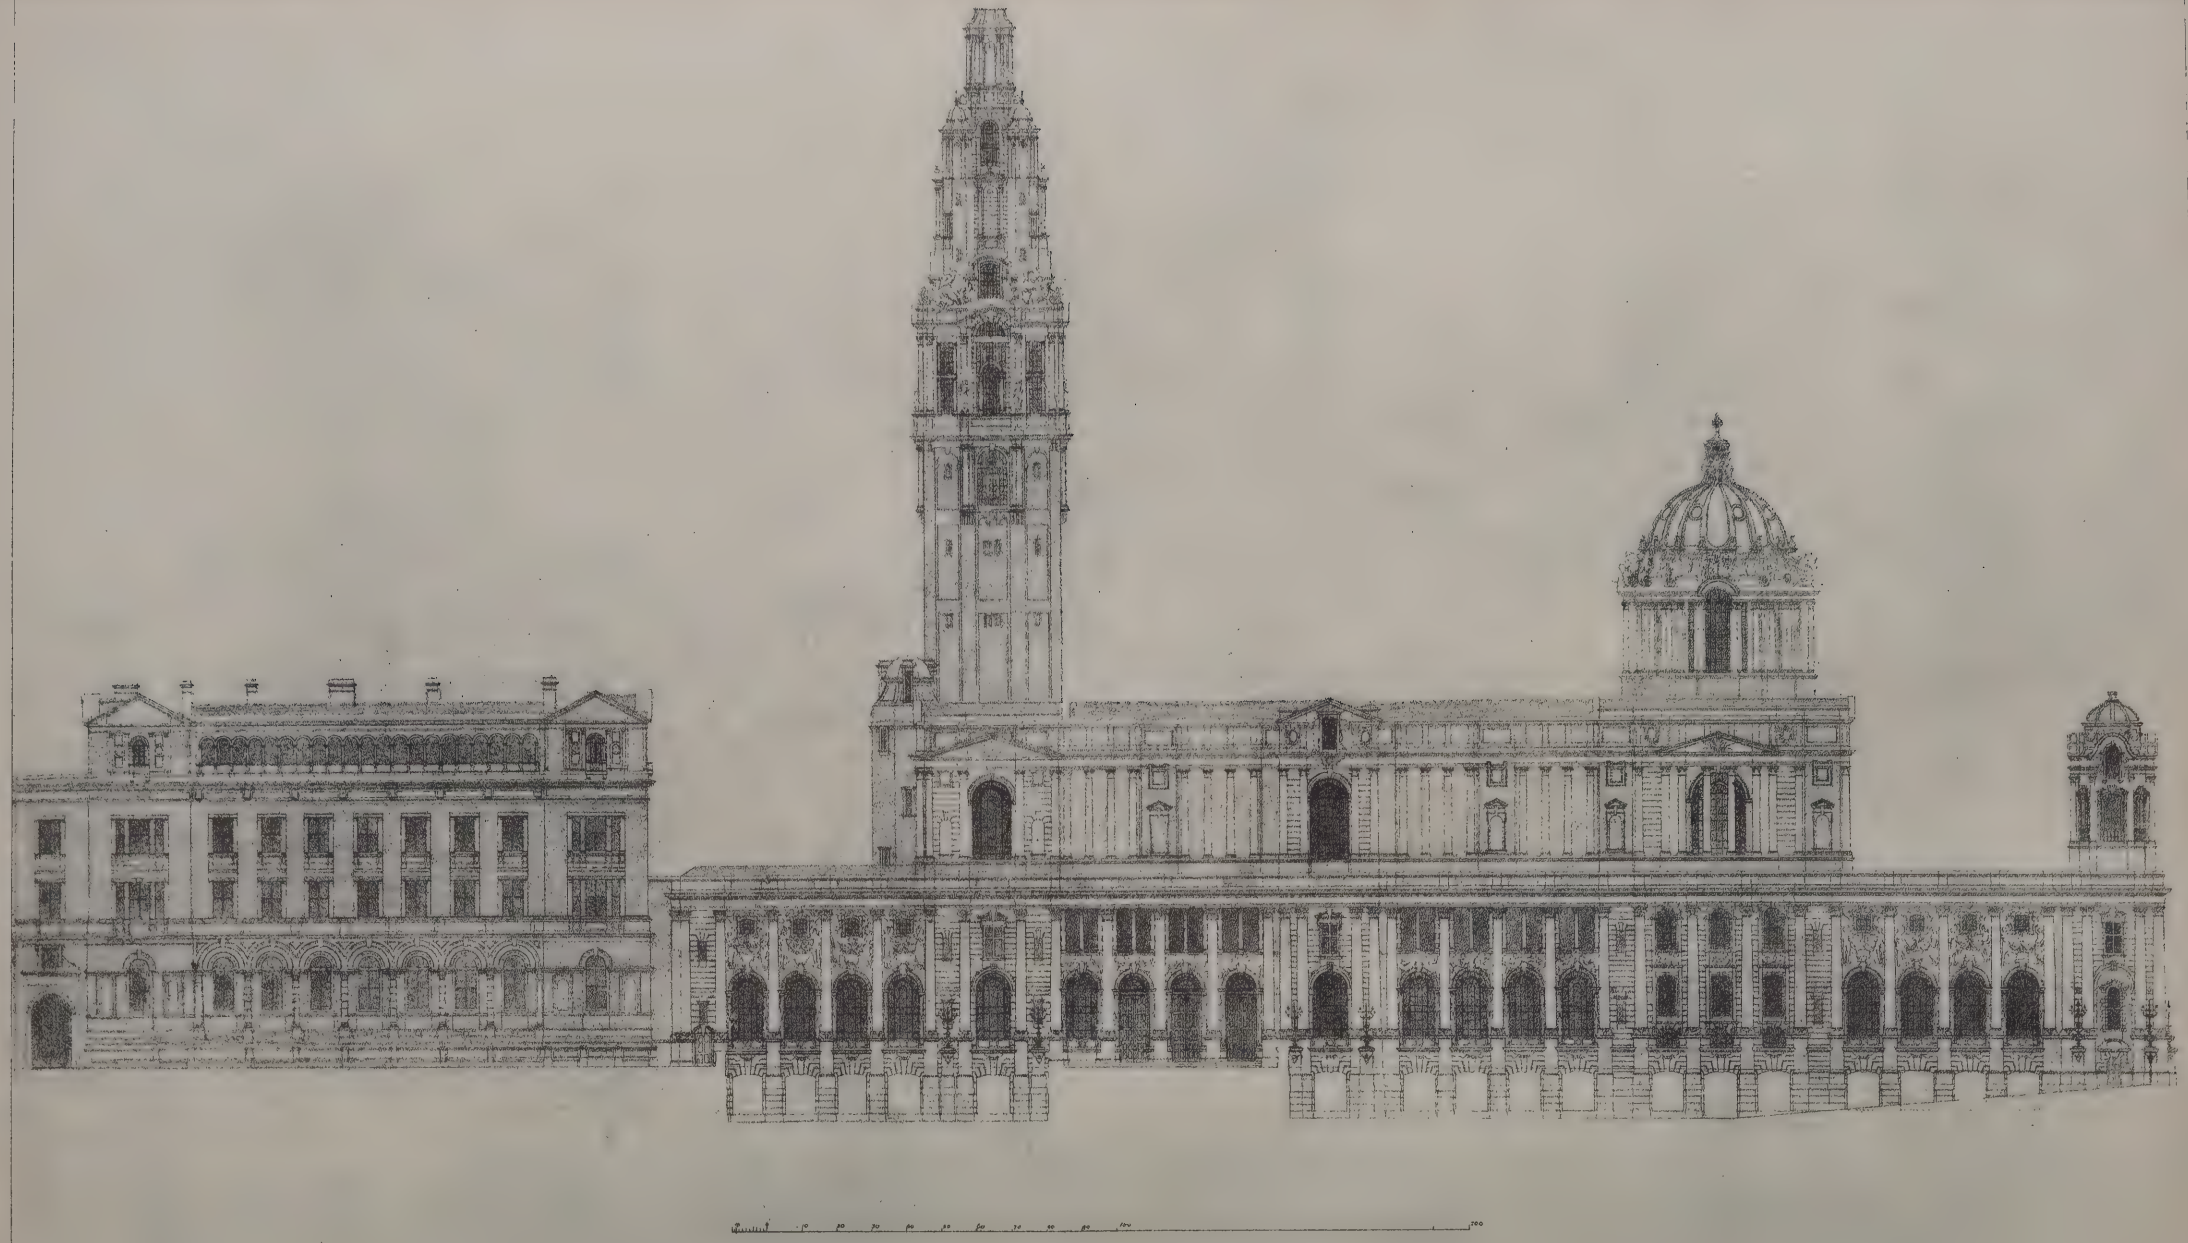
The Arsenal of Athens.

In October 1834 the foundations of the first royal magazine were laid in the Piræus, on a point of land running into the basin on the south side of the harbour. The workmen, in the course of their excavations, came upon a series of bases to columns, at a depth of about 2 feet from the surface. The architect, Herr Lüders, of Leipzic, immediately made sketches of them, and the Government directed that the works should be immediately discontinued if these antiques were found to be valuable. Herr Ludwig Ross, a professor of the University of Athens, who had charge of inspecting all newly-discovered monuments, immediately proceeded to the spot, and found four roughly-worked pedestals of columns 0·70 mètres in diameter, and about 2·60 distant from each other, formed of sandstone, inserted in a foundation work of the same material, the line of the series running from south to north. Near the second and fourth there stood to the east two blocks of a bluish white marble, hollowed, like water troughs, and a groove or gutter, formed of flat plates of blue-coloured marble. These plates, which reached from one extremity to the other, were fortunately only disturbed in one instance, in which the workmen had broken the slab into more than twenty pieces. Herr Ross found its lower surface covered with an inscription, for the most part defaced, but in which he easily recognised an account of the persons employed in the arsenal. He caused all the remaining plates, three in number, of which two had suffered by previous ill usage at a remoter period, to be carefully taken up, and on inspection found them to contain similar inscriptions. This discovery led him to the conclusion that the edifice in question belonged to a late Roman or Byzantine period, when the memory of the ancient greatness of Athens and regard for antiquity had sunk so low as to induce them to convert these precious remains to the purposes of modern construction. Ross conjectured that the Skeuothek of Philo (an account of which is to be found in Vitruvius) stood near this spot. And to the question of what has become of this immense structure, Ross replied by asking why we trace such slight remains of the once mighty mass of the Piræus itself. Had the Vandal Byzantines, who appropriated the inscriptions in question to these base uses, gone one step further, and not placed them with their faces to the earth, not a vestige would have been preserved; but fortunately, as if to shun the reproaches of the writing, they kept the engraved side downwards. Covered docks were built by all the great naval Powers — Samos, Corinth, Rhodes, Syracuse and Athens. The docks of Athens cost 1,000 talents. Strabo says they were 400 in number. Each dock held but one ship, and as the number of ships exceeded that of the docks it is quite evident that some must have been in the open air. A naval arsenal or storehouse is called Skeuothek. In the earliest inscriptions the Skeuothek is mentioned as one *par excellence*, in which the rigging or hanging gear was laid up, whilst the wooden framing lay near the ships in the docks. The celebrated new Skeuothek appears incontestably in the inscriptions. Many materials are enumerated as remaining from the building of it. It was the work of Philo, calculated to contain 1,000 ships. Strabo, Plutarch and Appian call it the Hoplothek. Otfried Müller has sufficiently proved ("De Monumentis Athenarum") that Philo flourished in the time of these inscriptions.

NOTES AND COMMENTS.

It is satisfactory to find that a majority of the London County Council (that is, forty members against twelve) did oppose the attempt to coerce the Council into purchasing the supplies of the eight water companies within a fixed period. The water companies, as no doubt was within their rights, have been taking measures with a view to such a purchase, and the present value of the undertakings is more or less factitious. The needs of the inhabitants of London have been disregarded unless extra profit could be derived from them, and in consequence the shares of the water companies have attained a value which is unknown out of London. Justice demands that in purchasing the property only equitable prices should be recognised. The proposal of the Parliamentary Committee placed the inhabitants of London in the position of a railway company that was bound to have works executed by a prescribed time, and must therefore pay an exorbitant sum for the land that was necessary. The Council have acted rightly in insisting on fair and equitable terms for any of the undertakings that may be required, that is, by recognising the true value instead of a juggled value, and for that purpose the possibility of requiring other sources must be considered. The question now is, What is next to be done? The directors of the companies know that the sources of supply are being secured by other places, and therefore in dealing with so important an affair empty threats from Spring Gardens are of no avail. The Council must lose no time in seeking after an adequate source, and it will be unprofitable as well as dangerous to suggest that such a source is to be found in one or two wells near London, although the quantity of water derived from them may amaze ignorant people.

The interest taken by Americans in architecture is suggested by the series of lectures about to be delivered in the Brooklyn Institute. Once a month, from October 21 to May 18, 1892, there will be a lecture. The subjects and lecturers are as follows:—"The Principle of Illusion in Architecture," Professor William H. Goodyear; "Some Instructive Churches and Cathedrals in France," Mr. Barr Ferree; "The Requisites of Museums for the People," Mr. Russell Sturgis; "Some Instructive Examples of the Early French Renaissance," Mr. Rudolphe L. Daus; "Saracenic Architecture," Professor George W. Plympton; "Some Sketches from an Architect's Drawing-book," Mr. William B. Tubby; "The Great Historic Arches," Mr. John H. Duncan. During March and April of next year Professor Goodyear will deliver a course on the following subjects:—"Greek Architecture as Related to Greek History," "The Greek Temple and the Details of the Greek Orders," "Roman Architecture as Related to Roman History," "Roman Architecture East of the Jordan," "The Byzantine and Romanesque Developments," "The Romanesque and Gothic Developments," "The Italian Gothic and the Early Renaissance," "The Later Renaissance and Recent Revivals." When so much attention is given to architecture, it is no wonder so many people expect that the next style is to appear in the United States.

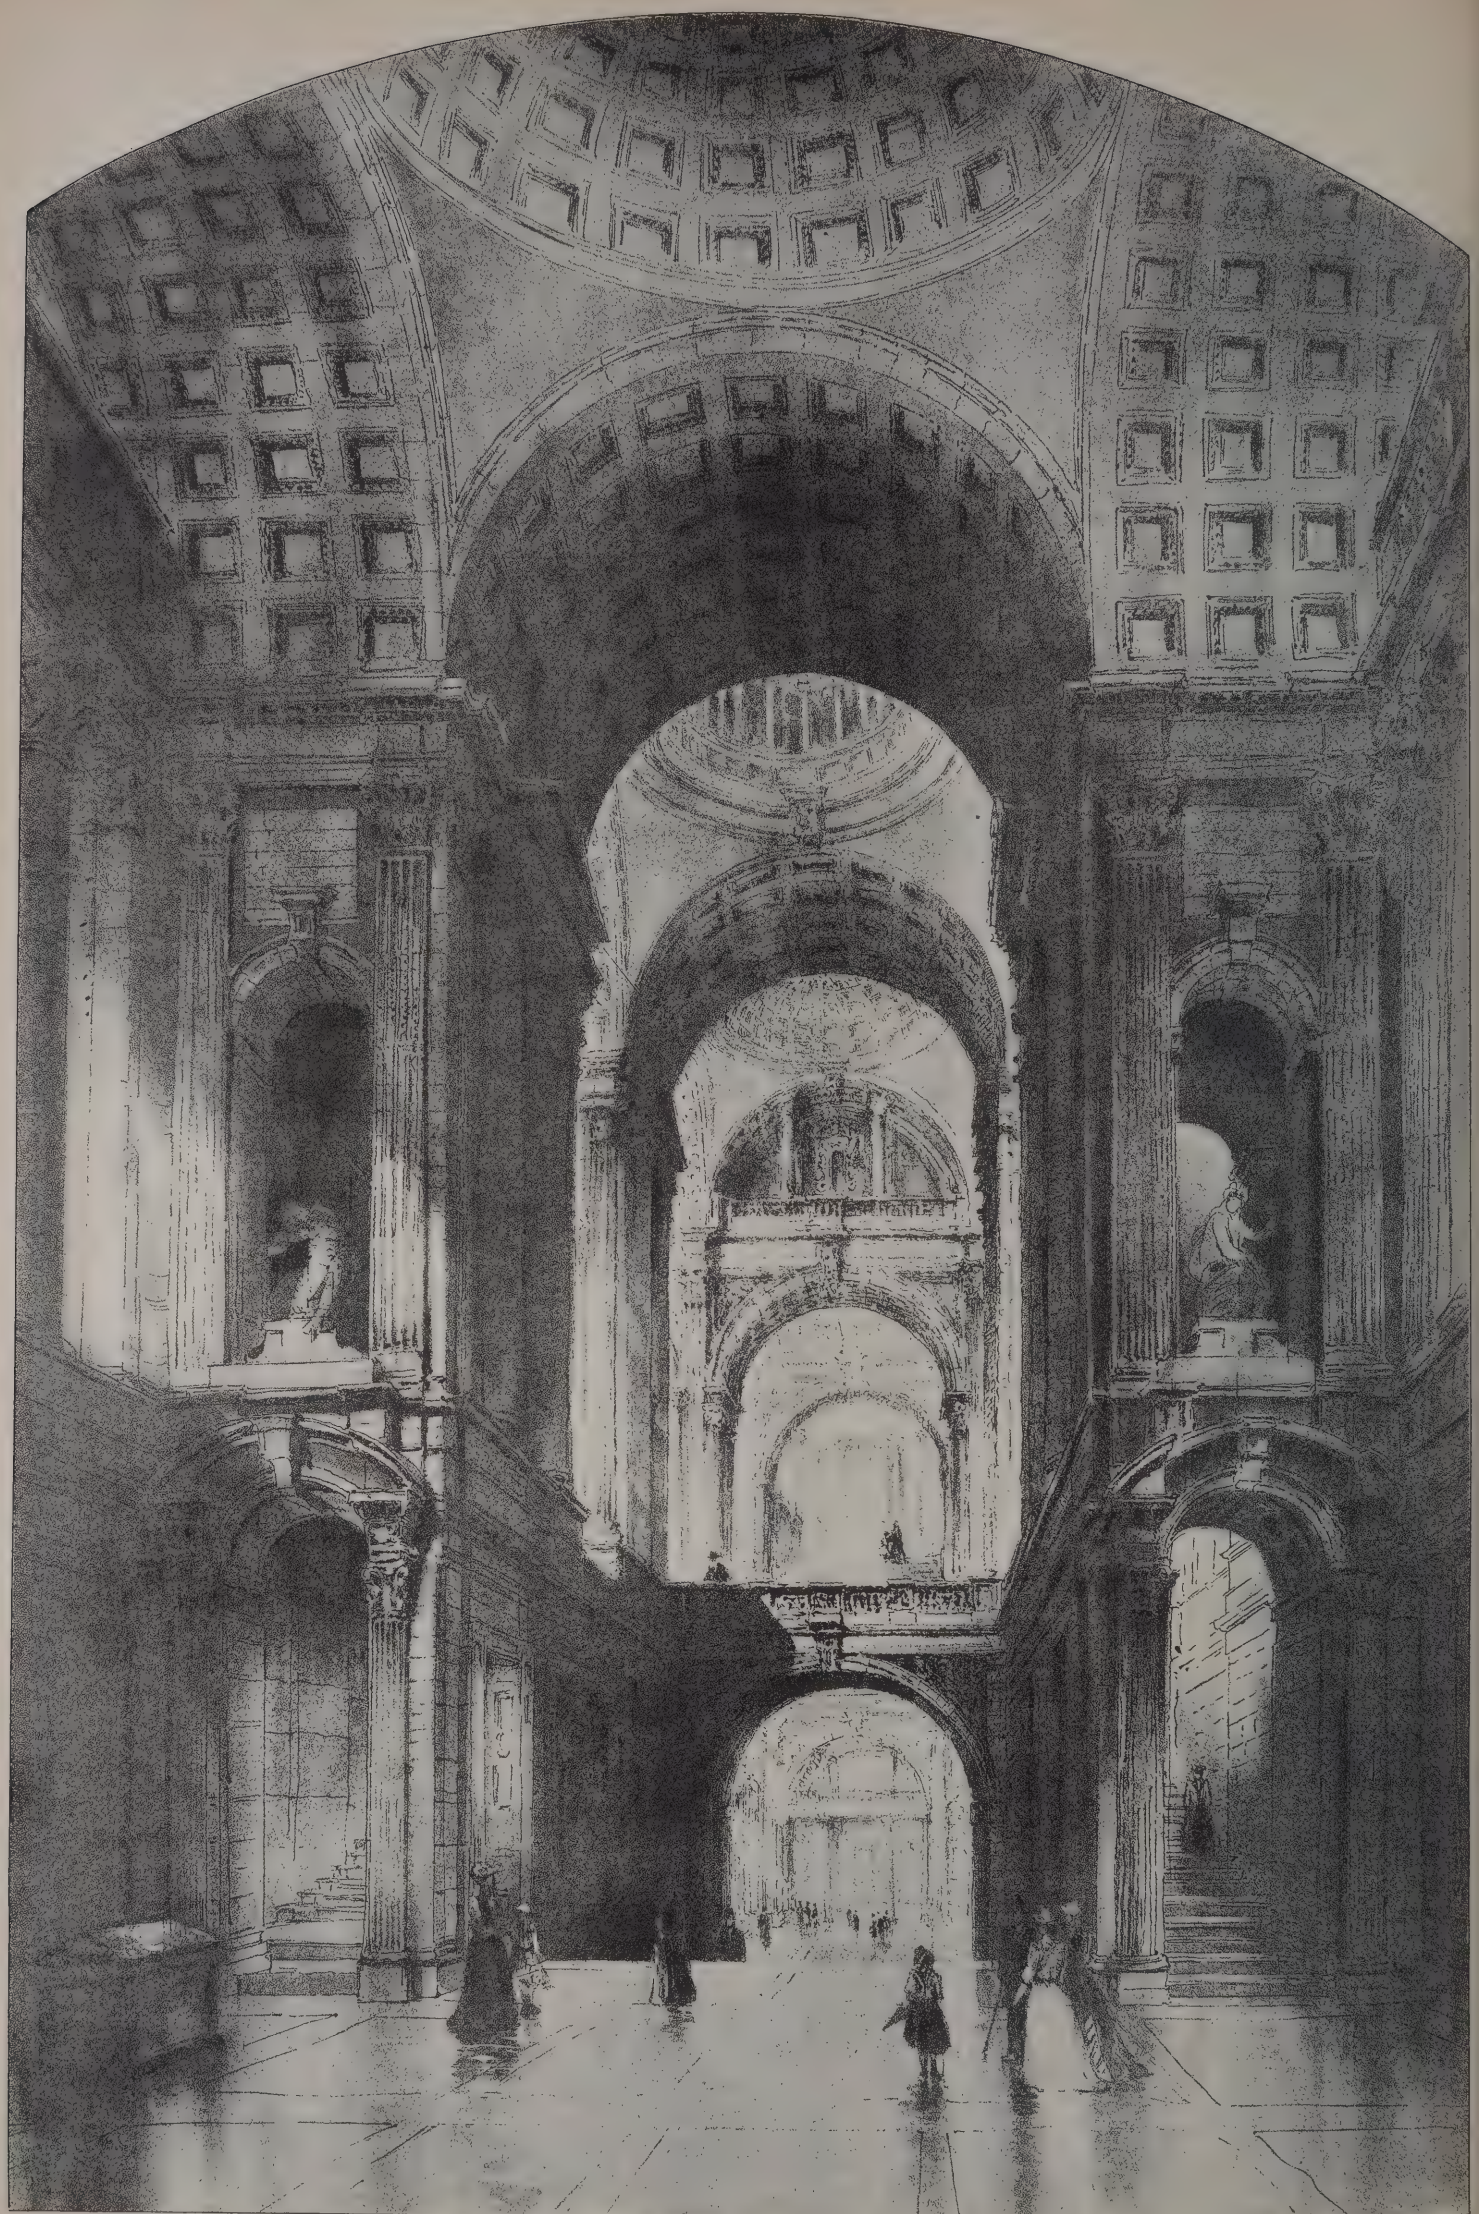


A paper was read by Sir Henry Bessemer, F.R.S., at the Iron and Steel Institute, describing an invention for the manufacture of continuous sheets of malleable iron and steel direct from fluid metal. After several attempts he succeeded in reaching the rolls with some fluid metal, and in producing a thin sheet some 3 or 4 feet in length. This sheet had a clear surface and was almost wholly free from oxidation, and absolutely free from scale. It was as tough as any rolled-iron plate he had ever seen; and it left no doubt in his mind of the entire success of this system of rolling thin sheets direct from fluid metal. Sir Henry Bessemer, having described the original form of his apparatus and the manner in which he now proposed to remedy its defects, concluded his paper as follows:—"With reference to the speed of production, let us assume the mill to be fitted with a pair of 4 feet diameter rolls, 18 inches wide, and making four revolutions per minute, and set to produce a sheet having an initial thickness of one-tenth of an inch, and rolled by the third pair to one-twentieth of an inch, we should thus have a surface velocity of the first pair of rolls equal to 50 feet per minute, and making, when finished, 100 plates, 18 inches by 12 inches, one-twentieth of an inch thick, and weighing 300 lbs., or equal to a production of one ton of plates in $7\frac{1}{2}$ minutes. Hence it becomes a question which is the least costly mode of dealing with a ladleful of fluid steel, forming it into massive ingots in moulds, or making it into thin sheets in the manner proposed?"

A couple of weeks ago we stated that Messrs. Kirk & Randall had written to the London School Board respecting the acceptance of a tender for the Kemsing Road School, which was 527*l.* in excess of theirs. The Works Committee now say that the actual difference between the two tenders was only 121*l.*, one being 16,440*l.* + 441*l.* for brickwork in cement, the other 16,354*l.* + 406*l.* At the desire of the Committee, Messrs. Kirk & Randall are to be informed that the Board are not bound to accept the lowest or any tender.

A form of tender has been adopted by the Builders and Contractors' Association of Victoria, which has interest for clerks of works. It is as follows:—"I hereby tender . . . , but this tender is subject to the condition (to be inserted in the contract) that the person who shall at any time be appointed to act as clerk of works shall be first approved of by me, or by the committee of management of the Builders and Contractors' Association of Victoria. N.B.—This condition is held to be necessary pending arrangements being made between the Royal Victorian Institute of Architects and the Builders and Contractors' Association of Victoria." All the Melbourne architects do not approve of the proposed arrangement, but when looked at from a contractor's standpoint, there is often reason for the stipulation.

There seems to be some difficulty about the proposed enlargement of the Royal Infirmary in Manchester. Some of the most influential citizens and subscribers have declared that while "it is manifestly important that the Infirmary should be retained on its present site in the utmost state of efficiency, any extension of the accommodation thereon seems to us very undesirable." Accordingly they have resolved to send a memorial to the trustees opposing such extension. The Board of Management have in reply called attention to the following remarks of Mr. E. S. Heywood, chairman of the Board, at the general meeting of trustees held on July 30, 1891:—"When the Board approved of plans for the extension of the building, it was their intention to submit them, together with a statement of the cost of carrying them out, to a special meeting of the trustees convened for that purpose, and to accept the decision which might be then come to. They were of opinion that it would be far better to submit a complete scheme of the proposed extension to the trustees than to ask them to decide so important a matter without full information as to plans, cost, maintenance and other material points, without which it would be undesirable for a decision to be arrived at." The Board, they say, wish it to be clearly understood that no plans for extension have yet been adopted, nor even considered, and they appeal to the trustees to withhold their judgment until the Board are able to lay before them what they consider best and necessary to meet the requirements deemed essential for the future of the charity. The correspondence suggests that the plans which are to be sent in are never likely to be carried out.



In the middle of April next an exhibition of means and appliances for the prevention of fire will be held in St. Petersburg. It will consist of six sections, viz. means to prevent fires, apparatus for the discovery of fires, engines and chemical compositions for extinguishing fires, appliances for saving life and aiding the wounded, means of transport for firemen and engines, organisation of firemen, statistics and literature. In the first section will be included fireproof construction, systems of heating and lighting, canalisation of electricity, lightning-conductors, composition for rendering materials incombustible. There will be medals and awards, besides prizes in money for the inventions that are considered to possess most utility.

NOS. 420–425.—DESIGN FOR THE COMPLETION OF THE SOUTH KENSINGTON MUSEUM. [J. BELCHER.]

THE SHEFFIELD SOCIETY OF ARCHITECTS.

THE Sheffield Society of Architects and Surveyors inaugurated their winter session on Monday evening by a conversazione, held in the drawing-room of the Cutlers' Hall. The president, Mr. C. J. Innocent, delivered his address, which was followed by an excellent musical programme, and the company had also the privilege of inspecting an interesting collection of pictures, etchings and other objects organised by the members of the society, assisted by their friends. The President, in his address, expressed his sense of the high honour done him in his election, and said although the society had not been long in existence it had not been inactive, and its work would be beneficial not only to individual architects, but also to the whole town. Practically all the architects and surveyors in the town had joined, and the financial position of the society was most satisfactory. The present was an age, he observed, when everybody seemed to be concerned about drainage and matters affecting the health of the people. Architects ought, above all men, to be so concerned, and they had every reason to see that in all these things the best that could be done was done. They ought to be ready to co-operate with all public bodies and officials charged with the duty of caring for the public health, and they had a right to expect that their efforts would be reciprocated in a friendly spirit. He suggested that a larger number of students ought to be connected with the society, and in order to induce them to join he thought the society might afford them assistance in the practical aspects of their training, which other institutions in the town rendered them in their artistic work. At the close of the paper a vote of thanks was passed to Mr. Innocent on the motion of Mr. J. B. Mitchell-Withers, seconded by Mr. F. Fowler.

THE LATE F. H. HENSHAW.

WE greatly regret to announce, says the *Birmingham Post*, that Mr. Frederick Henry Henshaw, the eminent landscape-painter, died on Sunday evening at his residence, Green Lanes, Small Heath, at the age of eighty-four. He was very seriously ill some months ago, when he found it necessary to submit to a severe operation. From this he recovered in a manner remarkable for a man of his advanced age, and it seemed as if he had still before him several years of a fairly healthy life. Within the last few weeks, however, he began to fail; there were indications of a return of his former ailment, and finally a weakness of the heart's action warned his medical attendants that there was imminent danger. On Saturday he sank into a condition of unconsciousness, and finally passed peacefully away.

Mr. Henshaw was born on December 11, 1807, in Edmund Street, Birmingham, the place of his birth being now absorbed in the site of Mason College. His father, a manager to a firm of Birmingham manufacturers, intended him for a business life, but the boy showed from very early years a strong bent towards art. He displayed this at the Lancastrian School, Severn Street, his first school, and afterwards at the branch King Edward's School in Shut Lane, Moor Street, and further at the New Street Grammar School, where his early education was continued. Happily, the elder Mr. Henshaw consented to allow the boy's obvious predilection to take its course, and consequently Frederick Henry Henshaw was, we believe, at the age of fifteen, articled to Mr. J. V. Barber, then a well-known and highly competent teacher of drawing in Birmingham, and himself a landscape-painter of no mean quality, as may be seen from some of his works now in the Corporation Art Gallery. At Mr. Barber's the young student had as companions in the studio such admirable artists as Creswick, afterwards the Royal Academician, Thomas Baker, well known in later years as "Thomas Baker, of Leamington," Charles Barber, Robert Brandard and J. T. Willmore, the engravers, J. J. Hill, and many more who subsequently became painters of note. The work of an apprentice at Mr. Barber's was such as to familiarise the students with every branch of pictorial art, beginning with the arrangement of the studio, the grinding of colours, and then proceeding to close and accurate study in pencil, chalk, monochrome-painting, and finally to studies in colour—an admirable method, combining careful work indoors with direct studies from nature. One curious feature of the apprentice's engagement was that until the expiration of the indentures all the work he did belonged, excepting by consent, to the master; and this was a condition to which, with rare departures, Mr. Barber firmly adhered. Mr. Henshaw's apprenticeship lasted until 1828; but previously to that time, in 1826, when he was nineteen years old, he had greatly developed his taste and knowledge in art by a visit to London to study the works of the modern English school of landscape painters, chiefly Turner, Calcott and Constable. These great painters at once fired his enthusiasm and fixed his own practice; to Turner, indeed, he was devoted throughout his life, and he never, up to the period of his latest visits to London, neglected an opportunity of reverently studying the great master's works. It was in the year 1826 that Mr. Henshaw first exhibited a picture—a view of *Handsworth Church*, which was hung on the line at the Birmingham Society of Artists' exhibition, and to the delight of the young painter found an immediate purchaser. After quitting Mr. Barber's studio, Mr. Henshaw began at once to exhibit on his own account, sending to all the provincial exhibitions then existing, to the Society of British Artists in London and to the Royal Academy, where in 1830 four of his pictures were hung. One of these works was bought by Colonel Berkeley, afterwards Lord Fitzhardinge, who proved a warm friend of the Birmingham artist, induced him to remove to London for a time, received him as a guest at Berkeley Castle, where he executed several commissions, and introduced him to many persons of rank who were interested in landscape art. In London Mr. Henshaw remained until 1833, and had he continued to live there, it is more than probable that he would have before long have secured admission to membership of the Academy. But he did not like London, notwithstanding the promise it afforded him, both by his own merits and the influence of the many friends he had made. He was essentially a Birmingham man, and desired above all things to live a free and independent life in his own town; he was an ardent lover of the country, and yearned for the means of easy access to rural scenes. From that time forward his permanent home was fixed at The Cottage, in the Green Lanes, which he enlarged and adapted to the necessities of an artist; and from this favourite residence he never felt the least desire to remove. In later years it became, under the attraction of his presence, the centre of artistic, literary and scientific society in Birmingham; there were few men of note in the town and its neighbourhood who were not at least occasional visitors to Mr. Henshaw's studio and smoking-room combined; there were not a few who, as habitual visitors, regarded this intercourse, prolonged for years, as amongst their greatest pleasures; and there still remain some—sadly thinned in number—who will always cherish the memory of those charming evenings, and the unfailing welcome, and wise and honest and cheerful talk of their kindly friend and host.

Such a life as that above indicated presents very little to record in the way of incident. One of the principal events which marked it was a journey made by Mr. Henshaw soon after his first marriage. The period from 1837 to 1840 he spent upon the Continent, visiting France, Switzerland, Italy—a leisurely journey, largely performed on foot, and affording ample opportunity of studying the greatest works of art and the loveliest and most picturesque scenes of nature. It was a working journey also, for the painter filled innumerable sketch-books with drawings executed with pen and pencil, made many sketches in water-colour, and also produced a few oil-pictures, which still rank amongst his best and most attractive works. It is needless to record in detail the places which Mr. Henshaw visited on this journey. It is enough to say that there was no picturesque district on the ordinary route, or fairly accessible to it, which he did not explore, nor was there any famous city of Switzerland and Italy with which he failed to make himself thoroughly acquainted. He had the advantage of pleasant companionship on a great part of the tour, amongst his travelling friends being Mr. Edwin Clark, the associate of Stephenson in building the Britannia Bridge; Mr. John Johnson, afterwards a famous London architect, then the travelling student in architecture of the Royal Academy; Mr. John Houston, in later life a member of the Royal Scottish Academy; and Mr. Marshall Claxton, at one time well known as a figure and portrait-painter. In Rome and elsewhere he also made friends of many other artists of note, amongst them Mr. Stevens, the designer of one of the noblest works of English sculpture, the Wellington monument in St. Paul's. With these friends, after his return to England, Mr. Henshaw kept up an intimate intercourse, and not infrequently received some of them as welcome guests in the Green Lanes. In 1840 Mr. Henshaw returned to England, stayed for a few months in London, and then came gladly home to Birmingham. Soon after his return he became a member of our Royal Society of Artists, of which he was in later years for a long period an officer, and up to the time of his death was a trustee. His return to Birmingham marked the beginning of the annual sketching tours which for over thirty years constituted an unbroken series, lasting each year from June until late autumn slowly melted into winter. These excursions extended over many parts of England, Wales, Scot-

land and Ireland: the favourite localities of the painter—with one notable exception, to be presently mentioned—being Yorkshire, especially Bolton Priory and Wharfedale, in England; Llangollen and its neighbourhood, in Wales; Galway and the west coast near it, in Ireland; and Skye, in Scotland. From each district, in its turn, Mr. Henshaw brought back with him not mere sketches, to be worked up in the studio, but finished studies, painted every touch and stroke out of doors, in the presence of the scenes themselves, and rendering with absolute faithfulness every subject which he attempted, no matter what might be its difficulties, and regardless of the time it might require. He never was a painter who simply aimed at showing a full season's work, and who was disappointed if the yield fell short in variety and amplitude. If only two or three studies, or even a single work of special mark, rewarded the labour of his annual journey he was abundantly content, for throughout his life his aim was quality, and not quantity. He loved nature too deeply and reverenced her too thoroughly to slur over any attempted presentment of her beauties, while, as to the pecuniary gain to be obtained by his labour, to that as compared with perfection in his art he was absolutely indifferent. For many years he steadily refused to part with one of his studies, but kept them on the walls of the studio for the purpose of reference, and also, as his friends might well believe, out of affection for work which had afforded him such intense pleasure, and into which he had put his whole soul.

We mentioned just now one special exception to Mr. Henshaw's wider sketching tours; this exception was his deep affection for the marvellous trees which adorned Packington Park, the remains of the Forest of Arden. Here he spent the outdoor season of the years from 1841 to 1843, and here for ten or twelve years later he never failed to give some considerable time to his sylvan studies. The works executed in the Forest of Arden are amongst the noblest efforts of Mr. Henshaw's brush. They stamped him as amongst the foremost of English tree painters; indeed, it would be no stretch of assertion to say that in this branch of art he has never been surpassed. Some admirers, not without warrant, think that he stands here unequalled. Some years ago a small collection of these forest pictures—the property of the painter's brother, the late Mr. John Henshaw, who had most carefully chosen them—was offered for sale. The writer of this notice then wrote of them in terms which he now repeats, with no desire to change a single phrase:—"There are no tree pictures nobler in quality, grander in character, more carefully or truthfully drawn. The wonderful thing about these pictures is their intense reality. Retire but a few steps from them, and you feel that it is possible to walk beneath the spreading branches of the great foreground oaks, or to wander, knee-deep in fern, into the dim recesses of the forest. Yet, with all this breadth and firmness, nothing of necessary detail is sacrificed, no 'finish' is omitted—every knot and furrow upon the 'thick, gnarled trunks' is given with marked fidelity; and there is no blot of shade or convenient mass of foliage to evade the drawing of a difficult branch or to hide a botch. All is as strong, honest and open as daylight itself. There could be had no finer examples of English woodland scenery the country through; nor could these have been more lovingly and perfectly painted. These forest pictures are amongst the finest works of one who has never been excelled as an English tree-painter." This judgment was amply confirmed when, in November 1888, a large collection of Mr. Henshaw's pictures was brought together and exhibited at our Corporation Art Gallery, from a desire at once to do honour in his lifetime to a Birmingham painter who deserved to stand beside David Cox as a true exponent of nature, and also to show, not his townsmen alone, but all lovers of art, the greatness and variety of an artist whose modest retirement had checked the spread of the fame he merited. On that occasion we endeavoured to sketch the quality of the painter and the spirit and method of his work, and we now reproduce that estimate:—"The first 'manner' adopted by Mr. Henshaw differed totally from that which characterises the works of his mature period. Though Turner influenced him most deeply, yet he was evidently also influenced to a considerable extent by Constable, and was led to paint broadly, hastily and without special attention to detail; aiming rather at effect than at the quiet and truthful representation of nature. In later years he lamented this period. Pictures of this time—the date referred to is about 1833—were brought to him in recent times to be examined and verified. 'They were,' he observed, when speaking of them, 'causes of disquiet to me. They were painted for the most part very rapidly, and were broader in treatment, and were of a less definite character as to detail than later works.' It was after a long course of travel on the Continent, and on his return to Birmingham about 1840, that Mr. Henshaw adopted the method which has ever since characterised his works—that of careful, even minute and most patient study in the open air, giving the fullest attention to detail in form and colour, in due subordination to the general effect he aimed at. 'I began the practice,' he says, 'of painting out of doors in the neighbourhood'—the Yardley district was a favourite resort with him—'and of making special studies of weeds and foreground material, larger than would be wanted for use, so as to insure accuracy of form and detail.' He mentions, also, that it was a habit with him to paint cattle and sheep out of doors and under sunlight—a characteristic of his works, for he delights in full daylight effects, and has never hesitated to grapple with the difficulties of strongly-lighted scenes. The reference we have quoted as to insuring accuracy of form and detail is a 'note' of Mr. Henshaw's method and of his works. No object, whatever its place in the composition—no weed or wayside flower, or trailing spray of briar, or lichen-spotted stone by the margin of a stream—is ever slurred over. Wherever such an object is introduced, it is as real and true and carefully finished as if it were the leading feature of the work. If it did not seem to be right on the first painting, it was erased and repainted—sometimes, indeed, again and again—until the critical eye of the artist was satisfied. Such a method of working of course entailed great labour and retarded facility of production. On this point we may quote a memorandum in which the artist explains and illustrates his method. He is referring to studies made in Packington Park, familiarly known as the Forest of Arden, which he visited for five years in succession, beginning in 1848. 'As I became more thoroughly acquainted (he says) with the intricacies of form presented by the objects which I had set myself down to paint, I often had to enlarge my studies, and, indeed, for the changes which occurred in the foliage of the trees, my studies often occupied me so long a period as five months each. I commenced my studies in June, and worked throughout the season until late in November. It became, therefore, necessary that I should have during this time two or three studies in hand, which were frequently carried forward during a couple of years, in consequence of the gradual changes in the foliage which occurred during the length of the season.' Down to 1879, when a serious illness rendered out-of-door work undesirable, if not dangerous, the practice above described was characteristic of all Mr. Henshaw's summer work. From June to November was spent in the open air, from early morning until late afternoon, now in Wales, now in Scotland, now on the West Coast of Ireland, or in Yorkshire, or Devonshire—whatever the change of scene the method and the labour were the same. The result was that the painter accumulated in his studio a vast collection of outdoor studies, really finished pictures, which were used by him only as materials for pictures to be painted in the studio during winter and spring. Nothing was done by him at home without constant reference to these invaluable guides, and, in order that no detail might escape record, it was his custom also to refer to photographs of the scenes he had visited, or of special portions of them, these photographs being mostly taken for him by his friend, Mr. George Shaw, who was often his companion from time to time during the sketching season. Thus, by patient working, by prolonged observation and by 'slow laborious strokes,' Mr. Henshaw drew to the perfection of his manner of painting the delightful transcripts of nature which we so much admire. The characteristics of his works are noted even by those who merely glance at his pictures, and are deeply appreciated by those who study them with due attention. Fulness and accuracy of detail, most scrupulous truth in rendering form, beauty and delicacy of colour, subtlety of gradation in tone, force and tenderness united in aërial effects, these are the leading qualities of his finest works, and they are, as remarkable in the smaller as in the more important studies, in the drawings as in the oil-pictures. The method is that of nature herself; the power and the knowledge are those of an artist who lived amongst his subjects, and studied them and worked upon them until he penetrated their spirit, and knew them alike by sight and by heart."

Of the personal qualities of Mr. Henshaw much might be said—of his genuine kindness, generosity, cheerfulness, the entire absence of vanity or self-seeking in his nature; his keen appreciation of the merits of other artists and his readiness to help them, especially the younger men who sought his counsel. Much, too, might be said of the simplicity of his life, his frank hospitality, his undeviating firmness of friendship. All these qualities and many more that redound to his honour will be warmly remembered by the friends who knew him intimately, and who will lament his removal as a loss that never can be supplied. Here space obliges us to close this imperfect record; adding only that Mr. Henshaw was three times married—first to the widow of Mr. James Dowell, formerly of Deritend, next to Miss Terry, of Geneva, and lastly to Miss Bint, of Packington, who survives him. He leaves no children. Indeed, his pictures were his children, as his studio was his home. Of his home we take the following bright and pleasant little sketch, published some time ago in a local magazine, from the pen of Mr. H. F. Henshaw, one of his nephews:—

"Everyone in Small Heath is familiar with the little old-fashioned residence in Green Lanes, with its quaint latticed windows and its low chimneys, to which the ivy and Virginia creeper lovingly cling, and form a cosy home for all kinds of

birds, which can be seen on a sunny day hopping about the chimneys or flying from tree to tree in the fulness of their bright and happy lives. It needs not my pen to tell that here resides a true lover of nature, for the house and its surroundings proclaim the fact far more eloquently than words. The thrush sings from the top of the tall poplar at the back of the orchard, and the sparrow chirps it from the roof. The noble old trees that fringe the road and the fields in front tell the same tale. The thrush is right and the sparrow chirps truly, for here, for over fifty years, has laboured Mr. Frederick Henry Henshaw, the great landscape-painter. But then no one in Small Heath needs telling this, for every boy knows the house, if only because of the large pears that grow in the orchard, or of the horse-chestnuts to be found on the trees. Every one is not, however, so familiar with the interior of the house, and therefore I shall not tire them if I give a slight sketch of the studio. The whole of the rooms bespeak a love of art, but one must go to the studio to see the true home of the artist. It is a large, low-roofed room, and the walls are smothered with pictures. Over the old-fashioned fireplace, in which large logs of wood are cheerily blazing, is a fine specimen of the artist's own work, the subject being an old wooden bridge spanning a river; to the right is another of his productions, a copy from Claude, a landscape showing the beautiful orange tints of a soft Italian sunset, whilst on the left is a fine work of Nicholas Poussin. Except for the spaces taken up by bookcases, well stocked with volumes which testify that the occupant is a lover of literature as well as of art, the walls are covered with pictures and studies. The numerous easels, too, ranged about the room also bear studies, the subjects usually being forest scenes, trees, or masses of rock covered with moss and lichens. The studio is, in fact, eloquent of the man who has lived and worked in it for so long a term of years. Nature in various forms smiles on you from every side; look which way you will, your eye meets tree and fern, mountain and stream, whilst in the centre of the room is a sketch nearly finished, depicting a familiar Warwickshire scene. The picture is not complete, however, without the occupant, a cheery, white-haired old gentleman, who welcomes you in with the kindly smile and hearty 'How do you do?' which at once puts you at your ease, and in a few moments you are holding a pleasant conversation with him."

MODERN VENTILATION.*

WITH an audience such as this, composed exclusively of past masters in scientific sanitation, I am relieved of the necessity of preluding this paper with any arguments as to the importance of the subject. I do not think, however, that the opinions of many of us would coincide, if required to define good ventilation. Apparently the point of perfection would be attained if we filled our houses with air precisely similar, in its percentage of injurious matter, to the external atmosphere, varying, however, the temperature to suit our ideas of comfort. This may appear a simple matter, but unfortunately not only have different persons different ideas of comfort, but doctors themselves disagree as to what change of air in a room constitutes efficient ventilation. In the case of heating we have a thermometer to guide us, and the human mind is so constituted that it conceives the body to be warm, if only the thermometer indicates a comfortable temperature. With ventilation it is different. Persons who have been in the room for some time must feel comfortably warm; those coming in from a sharp walk in the frosty air must feel cool; draughts must not exist, and, if the building possesses a gallery, the temperature there must be as comfortable as that in the lower portions of the house. Too much warmth is called "bad ventilation"; too much draught is "bad ventilation," so is too much cold. There are many difficulties which arise in aerating buildings, and although the natural laws utilised in such a task are well known, unalterable and simple, yet the applications of them are diverse.

I will briefly indicate the more usual plans to consider their advantages and disadvantages, and from these to gather materials for the delineation of a system which shall, as far as possible, obviate all the objections. In the first place, we must consider the essentials of a good method of ventilation, then must see how they are complied with by the usual systems, and how the problems of their failure upon certain points may be solved.

The first essential of a system of ventilation is that it shall not produce discomfort by causing a feeling of cold. Air, even warm air, impinging to a perceptible extent upon the skin's surface, causes rapid evaporation, and the avoidance of this should be the first consideration. It is this evaporation which causes "a cold," and the mere expansion of the air by passing it over heated surfaces does not prevent it. Then a perfect system is under complete control. It must be in our power to increase the intake of air and the rapidity of its expulsion, as circumstances vary. A hard-and-fast rule cannot be adopted, but we must have a system which at will may wield a giant's power, or be quiescent. Again, it must be cheap, and of such a nature as to admit of its application to existing buildings without radical alteration; to cottages or to palaces. It must be simple, so that inexperienced persons may understand it; and scientific, so that accepted philosophical formula may enable success or failure to be reasoned out on paper.

If a system complies with these requisites, and yet effects a complete change in the atmosphere of the building so thorough that no person is obliged to inhale products of previous respirations, then I think we may look upon it as perfect. The nearer it approaches this perfection, the more worthy its adoption by sanitarians. By sanitarians I mean those upon whom we rely in sanitary matters — yourselves, surveyors, architects, civil engineers, &c. But it is very certain that the great responsibility rests upon those controlling new buildings either for the owners or on behalf of local authorities, and I am glad to say that they are aware, fully I think, of their responsibility, severely critical of any innovation in sanitary matters, but keen to appreciate what their judgment and experience shows is a practical advance.

We may divide ventilation systems into two classes, naming each by its method of dealing with the mass of air to be changed. One class effects a movement by increasing the atmospheric pressure at one point, the other by attenuation, and in both cases the effort to regain equilibrium is the movement attained. One is a method of "Propulsion," the other "Extraction"; one tends to increase density, and the other to lessen it. You will observe that the tendencies I name are absolutely governed by the disproportionateness of the inlet and outlet areas, or by the amount of friction arising in either case.

The most usual mode of effecting ventilation is the extractive action of the wind upon the upper extremities of shafts or flues, and although the aspirating effect can only be exerted under certain conditions, yet there are so many different inventions in the direction of procuring these conditions, that any attempt to describe them in detail is hopeless. But all aim at one object—that the passing wind shall produce a rarefying effect at the particular point where it crosses the surface of the still air in the shaft or cowl, thus inducing a movement in the direction of the partial vacuum.

Most of you have read the list of results given by Mr. Helyer in his work called "Sanitary Houses," and you will have noted that there the open tube is placed far down the list. But these tests, interesting as they are, give no idea of the relative value of the cowls tried, the chief information being as to which cowl extracted most under the then conditions and directions of the wind, or which allowed the least down blow. It is obvious that a wind inclining towards the earth at however small an angle (Glaisher's balloon records prove distinctly that actually vertical currents of air occur) would entirely prevent the open tube from being an outlet, whilst ingeniously-constructed cowls would be scarcely adversely affected at all.

The cowl which seems to me to approach nearest to the conditions of the open tube, without its disadvantages, is the cowl invented by William Sugg, of Westminster, in which the top of the flue is enlarged and covered with a flat plate in which are set numerous small tubes. Thus a flat cap, fixed an inch or so above these outlets, may easily be of such an area that the downward angle of obliquity, at which any wind could possibly enter, must necessarily be very acute, in fact practically nil. Thus the extractive power of the open tube is very nearly obtained without the difficulties of down blow. Putting aside all questions as to the kind of cowl, it is certain that with a wind moving, ventilation and adequate ventilation may be obtained. But it fails upon all the essential points except one. If the wind exceeds a moderate breeze the extraction is too rapid, producing very disagreeable draughts, and is only under control by the partial or entire closing of inlets and outlets. And unless the wind remains constant and equal for a period unusual in this latitude, this opening and shutting might well engage the attention of a couple of men. Persons in a room ventilated by means of extracting cowls alone are at the mercy of every variation of the wind, a condition of things quite unworthy of our times. But nearly every building is so ventilated nowadays, and it may appear difficult to reconcile my opinions with the fact that many of the most eminent architects of the day are satisfied with ventilation by cowls alone. Ingenious methods have been devised for nullifying the serious objections I mention, the most intelligent being the adjustment of an intricate labyrinth of cords, weights, pulleys, dampers, &c., by which the whole ventilation scheme may be amended and the entire aperture closed. Persons destitute of invention arrive at the same end by stuffing dusters and newspapers into the ventilator, but still the fact remains that there is a ventilator on the roof, and (again calling to mind that

* A paper read by Mr. J. F. Simmance, at the Free Library, Liverpool, on October 10, before the Association of Public Sanitary Inspectors of Great Britain.

thermometer which, fixed at 70 degrees, saved 50 per cent. of fuel) that is considered by the plastic human mind as sufficient evidence of ventilation. But the uncertainty of the method of extracting by cowls alone is too apparent for discussion. It is difficult to believe that architects can place reliance in ventilating engineers who prepare hard and fast formulæ on the subject, and who say, "A cowl of my make, of such a diameter to every so many feet of cubical area, will extract so much air per hour," without taking into consideration the wind, which has to provide engine power for the whole business, and which is absolutely master of the situation. The only one of the essential conditions with which the cowl system complies is its cheapness. The system for future use is not one dependent upon the whims of the wind, and we must look for a force more reliable and controllable. Such forces are not very numerous. We may use water, steam, or gas, either as spray injectors, or as motive power for fan-driving. Gravity may be used for the same by means of weights and pulleys, but I do not think it is often adopted, nor are clockwork (spring motion) or electricity. Now all these are controllable, and may be made to increase or decrease the ventilation at will, and to propel air into a room or to extract. A water-jet is simple, cheap and easy to work; its disadvantage is that the air becomes saturated. This is all right in summer, but in winter the air must be passed over some absorbent material, and then again the jet is affected by frost. As a power for fan-driving it is good, but only has one rate of economical speed, according to size of engine and fan. Somehow water motors are not yet very popular, and it is only amongst organs and barbers that they make notable headway. This is possibly the fault of the water authorities, who do not encourage motors, and it may also be on account of the uncertainty of water supply unless a storage is arranged, and the difficulty then is to get head enough.

For spells of work of a few hours' duration the gas-engine is infinitely preferable for fan-driving, whilst for large work a steam-engine is as yet unapproached. In all these methods the question of position, whether to extract or propel, is optional. At the Liverpool Town Hall the fan extracts, and at the Mersey Railway, Hamilton Square, the 30-feet fans extract. At the Glasgow Infirmary, propulsion is the method. A paper upon this latter installation was read at the meeting of the British Association, and many arguments were brought forward to prove the advantages of the method. As these will apply to all similar cases of propulsive ventilation, I will mention the more important points.

The propulsion of fresh air into the building at the floor line, and not the extraction of foul air by way of the roof.

The filtration of incoming air by passing through damp material.

The absolute prevention of back draughts or down currents.

There is no doubt that some of these items are real advantages, but these are not peculiar to the system under consideration. It is difficult at first glance to see the difference between the principles of extracting at the roof-line, and forcing out at the roof-line; but later on in the paper we find a sort of explanatory note. The air in the building is compressed to the extent of 1-20th to 1-10th of an inch of water, and so should there be any leaky joint of a drain or soil-pipe, sewer gas cannot escape, the external pressure being the greater. Ventilation by extraction acts in just the opposite direction, and sucks out sewer gas from faulty plumbing work. The fallacies of the arguments are apparent to me, and probably are already to you. To maintain a pressure of 1-10th of an inch of water in a room by means of a fan, means that the exits must be smaller than the inlet, so that the pressure accumulates, and at first one does not see the object of this arrangement. But it becomes startlingly apparent when the faulty plumbing comes in, and it is evident that it is for the sole purpose of guarding against Glasgow plumbers that the air of the Infirmary is maintained at this undue density. But supposing such an internal pressure valuable sanitarily, would not the opening of a door or window upset the system by releasing the pressure? I think, too, that the provision of an abnormal atmospheric pressure upon the house side of a w.-c. trap is a distinct mistake. Seals of traps are not too deep as it is, and with the house side further depressed, and part of the proper seal sent down the branch soil-pipe, it appears to me that the impulse of shutting a door or of the closing the outlets for a few seconds might easily unseal the trap, and would certainly do so if coincident with a flush on the same stack from another floor. The convenience of being able to filter the air as it comes in, and to warm or cool it, is undeniable; but the same is arranged for in most systems.

The method I advocate, and arguments in the favour of which I wish to place before you in this paper, is an old one, the very oldest in fact, but its successful application in the particular direction I desire to describe has, until recently, been difficult. The problems I think requiring solution are those attending the proper and economical utilisation of heat to ventilation. As I say, it is the oldest system, as old as time itself. The aëration of the entire earth is effected by it. The winds which sweep through crowded alleys and courts, scattering the stagnant exhalations of many lungs, of much filth and possibly of much disease, are heaven-sent disinfectants, and their sole motive force is heat. The almost imperceptible breeze which creeps amongst, and yet scarcely stirs, the blades of grass, which carries the tiny green shoots their diet of oxygen and removes the resultant impurities, or, it may be, brings the change of diet and, parting with its load of carbon, is revivified by the plant itself—this gentle wind has no cause but heat, and but for heat would not exist. With such examples surely we cannot be wrong in looking to heat as the true and natural source of ventilation.

There is a way of applying heat to ventilation—cheap, automatic and suitable for all classes of buildings. This is to utilise the heat of gas-lighting. Gas is now so general that we may consider it almost universal; but in country places, where petroleum is the only means of lighting, my remarks may be deemed to apply equally to it.

I am able to say definitely that the amount of gas (whether from coal or from petroleum) which will light a room adequately will ventilate it adequately. Only the system must be a good one. If it is to be successful there must be no rule of thumbwork, but to instal it properly is no more expensive than to fit it up in a manner which will insure failure. It is a matter which has received little attention, and for want of such attention has been relegated to the background. The difficulties in the way have appeared insurmountable, and many architects after considering and perhaps trying the system have become doubtful. The installation has been expensive, as flues have had to be bedded in non-conducting material to prevent danger, and it meant pulling a building to pieces (if not being lighted *de novo*). Then the lights wore out, required new burners, cleaning, and were generally rather inaccessible. The difficulty of preventing down draught, too, was great, and to overcome this the flues had to be carried in a serpentine way round the building and up the roof until the flue top could look triumphantly down all the neighbouring chimney-pots. This generally stopped a blow down, but just as certainly stopped any draught up. All the heat of combustion was absorbed by the shafting before it had gone many feet, possibly condensed, and in that case dropped in water, and spoilt the ceilings and tempers of people below. Ventilating by gas-lighting was looked upon as a nuisance, and extravagant pendants, fitted with fishtail burners which blackened the ceilings, and also the reputation of gas-lighting, were and are to a large extent looked upon as the most scientific and useful way of using gas. But all the faults I have named are non-existent in a properly-arranged system, the installation is cheap, and the results in lighting and ventilation most satisfactory. The ceilings and decorations are preserved, and architects can, by selecting such a system, insure those two desiderata, good light and good air, without which no building, be it as noble as the Strand Law Courts (where I am told the windows won't open, and where the accumulated sighs of defeated suitors form the only atmosphere), or as useful as the Rotunda Lecture Hall, can retain the admiration of the public.

A ventilating gaslight must be without glass or breakable material if fixed at such a height as not to be accessible at all times, and must be easily lighted from below. It must be shadowless, and be susceptible of being reduced in power to such an extent as to give off a heat of not more than 100 deg. at 6 inches above the point of ignition, and it must be capable of being increased until its full power causes an intake sufficient to fill the room with fresh air in ten minutes. The shafting from the light must be such that its external heat is practically nil, whilst the internal temperature must be very high. Its outlet must not disfigure the building, and must be arranged so as not only to prevent a blow down, but a suck down, or that great enemy an external compression. These features (which are quite indispensable) can be arranged by the aid of recent inventions, and indeed all the previously conceived objections to ventilation by gas may be obviated.

The light which I have found to answer best is the vertical-flame system of William Sugg. This adopts burners of steatite, that extraordinary material which, soft as meerschaum naturally, attains a maximum hardness when heated to the melting-point of cast-iron. It is non-conducting and practically everlasting, non-corrodable and unalterable in dimensions by heat or cold. A cluster of such burners up to the required greatest power are placed immediately below the mouth of an extracting shaft, communicating direct with the open air either perpendicularly or horizontally. You will probably, and naturally, think that a flame burning vertically close to the ceiling wastes the greater part of its light upon the cornice of the room, but it is not so. The experiments made by Mr. Dibdin, chemist to the London County Council, and who is fast attaining the rank of one of the first scientists of the day, prove this conclusively. He found, and stated before the Society of Arts, that the angle of 45 deg. to the vertical of the flame under test gave the greatest result in light. In the ingenious ventilating light of which I speak,

the downward rays at that angle cover the outer area, whilst the upward angle rays are returned to the spot immediately below the light by an enamelled iron reflector. Thus a result in light of great brilliancy and economy is obtained. The heat of combustion, being enormous immediately over the flame, ascends through the aperture provided, and travels along the shaft. Now this shaft is the subject of a further patented invention, and is lined throughout with a material known as asbestos felt. This absolutely prevents any condensation (which occurs when the products touch the bare tube, and which is not at all prevented by covering the outside of the tube), and not only so, but utilises the great principle in ventilating, viz. the conservation of heat. Not only is the outer case kept cool, but the inside is kept hot, and whether the shaft is horizontal or vertical, the heat is sustained with little loss through its length. At a suitable point communication is restored between the inner hot shaft and a tertiary flue or casing which opens into the room round the ventilating light, and with the impetus gathered from its travels (for you will remember it is not losing heat) the inner cone of hot air rushes out, causing an aspiration in the outer air-tube equal to the action of a gale of wind at a happy angle upon an open tube. Thus, by aspiration and expansion, air is drawn from the room in quantities controllable by simply turning a tap, and the output varied from 15,000 cubic feet per hour to 300,000, for a foot of gas in such an apparatus as I have described will extract nearly 3,000 times its own volume of air.

The question of "back draught" or "down draught" is one which will occur to many of you, and it is an important one. We can stop a blow-down with a cowl, but what cowl will stop air from passing down it if sucked into the room by some force greater than the wind's action on the cowl? If a fire is burning at the foot of a tall chimney, the outlet of which is higher than the cowl, how can we prevent the fire from drawing its air supply from this convenient, cowl-protected inlet in the roof? As I have said before, no cowl of itself may stop it. But in the ventilating light scheme the difficulty is surmounted by the insertion in the cowl of a disc of talc or similar material, which is perfectly flat, and rests upon the end of the shaft, which, being carefully and squarely cut to meet it, makes a sound joint, air-tight against any external air. The disc is threaded on a central pin, and is attached in no other manner, nor can it become rigid in any way. Now the theory of this valve is bound up with that of the non-conducting lining; each is to some extent imperfect without the other, but together they utilise that power which has, I think, never before been brought to bear on ventilating lights. This is the "conservation of heat" already mentioned. You are aware of the rule which makes hot air ascend—it is simply pushed up by the weight of cooler air descending, and the impulsive force of heated air is according to the degree to which it varies from air at normal temperature. We will instance a column of air 1 foot square by 20 feet high. This weighs about 1·6144 lbs. What keeps this column of air from rising will be the fact that neighbouring columns of air the same dimensions are at the same temperature. We will consider such a column as being contained by a non-conducting shaft, 20 feet long by 1 foot square. This we will suppose to be subjected to heat, but before applying the heat, we close the top of the column with a flat plate of no weight, and on this place shot of known weights. When the heat is started the air in the column expands, and at first the surplus contents flow out at the unclosed end. The hottest air rises up the shaft to the top under the plate, and a pressure is exerted upon this plate equal to the difference in weight between the heated air in the column and a similarly-sized column of unheated air. If our column of heated air is at 480 deg., then we have doubled its volume, halved its density, and obtained an upward pressure of half its weight, that being the difference between the heated column and an imaginary cool column. So, if the plate we speak of is weighted to ·7 of a pound, still the upward force will lift it, and, *nota bene*, if a down draught presses upon the plate to any extent less than the upward impulse, the plate will still be lifted up and the exit take place in spite of down draught. This plate is represented in our ventilating schemes by the exit valve, the disc. We will suppose an external compression of the atmosphere to exist which holds this disc-valve tightly on its seat, then the heated products from the ventilating light fill the tube right up to the valve, and, losing very little heat by the absorption of the shaft, continue to get hotter until the upward pressure exceeds that of the down pressure, forces it back and makes exit. Should the down pressure be severe, as long as it does not exceed the ·8 or ·9 per square foot the conservation of heat (soon reaching 400 or 500 deg.) will cause an exit to be forced. Thus a down pull on a ventilating outlet may be overcome, and with these inventions ventilating exits may be made in places which have been impracticable hitherto. But we have another assistant in this matter. The exit valve spoken of is placed in one of the powerful Sugg cowls before-mentioned, so that not only does the light cause extraction, but the cowl does its work when no light is going. Its work is such that the mere passing of a wind across it will cause extraction and keep the valve balanced in the current until a cessation in the upward current, and the consequent threatening of a down draught, will restore it to its seat. But you will say with reason that such a cowl extractor with a heavy wind will cause undue ventilation. By a simple mechanical arrangement the exit valve is in exposed situations made to act as a regulator, which allows free outlet so long as the fixed output is not exceeded, but, under a violent extraction, closes the orifice in proportion to the increased suction, keeping the output regular and unaltered. For about two years some of these have been in work, and have never failed, nor can any traces of wear or disorder be perceived; apparently they are as good as ever, although exposed to the full heat of ventilating lights (in one case within 3 feet of the flames).

As regards the efficiency of this system of gas ventilation, I examined recently an installation at the Grosvenor Museum, Chester, whence unventilated lights had been removed. In this case the committee, sitting under the presidency of the Duke of Westminster and the chairmanship of Sir Horatio Lloyd, had carried out extended experiments in the rooms of the Technical Education Department, and authorised the honorary secretary, Mr. J. R. Griffiths, of Chester, to give a certificate to the effect that the temperature of the rooms did not rise one degree, with the rooms full of students and after hours of work. The lighting was characterised as perfect.

The question of air inlets must be answered; but I should hesitate to advocate the arrangement of a greater area of inlet than outlet, unless circumstances precluded the ample distribution of the inlet orifices.

There appears to be no one of our conditions with which ventilation by gas-lighting does not comply if carried out as I have described. It is cheap if put in when the building is going up, the light itself being the only item of cost worth considering. It can be fixed almost anywhere and can be made to work well. At one stroke the lighting and ventilation is accomplished and you have the best of both. There is no advantage claimed for electricity which is not possessed by gas so used—cleanliness, coolness and efficiency—and comparison does not exist upon point of cost. Every small house could be fitted whilst building with the shafting, leaving the tenant to select his light, and this he could buy at as little cost as a gasalier. Finished houses can be ventilated without pulling them to pieces, and the parts of the system which would be considered fixtures and unremovable are the cheapest parts of the installation. The light may be in powers from 16 to 2,000 candles, and will last for years. There is no danger in their use, and gas explosions from sliding and other imperfect chandeliers are abolished. You only pay for gas (less than you would for a less scientific system), and you get ventilation into the bargain. You have an ever-ready mechanical force, which will at any time educt vitiated air from the room by the simple means of a lighted match and a turned tap.

MEDIÆVAL EXPLORATIONS IN ENGLAND.

THE earliest systematic excavations in England of which we have a definite account were made among the ruins of Verulamium in the earlier part of the eleventh century by two successive abbots of St. Albans, Ealdred and Eadmer. We learn from Matthew Paris that Abbot Ealdred overthrew and filled up all the "subterranean crypts" of the ancient city, as well as the vaulted passages, with their windings, some of which ran under the bed of the river. He did so, says Mr. Wright, because they had become hiding-places for thieves and strumpets. The subterranean ruins of Roman Paris are described as the haunts of a similar class of society in the twelfth and thirteenth centuries. Ealdred also destroyed and filled up as much as he could the fosses of the ancient city, and certain caves, which afforded a place of refuge to the robbers who prowled in the neighbouring woods. The abbot laid up carefully all the unbroken tiles or bricks and the stones which were fit for building as materials for the new church which it was his intention to erect. With this object he made great excavations in order to discover stone buildings. As the workmen were digging near the bank of the river they found oak planks with nails in them, and covered with pitch, apparently part of a ship, as well as old rusty anchors and oars, which proved, as Matthew Paris thought, that the sea had once encircled the town. Moreover, they found shells such as are commonly cast upon the sands of the sea-shore. The places where these were found received the appropriate names of Oysterhill, Shelford, Anchorpool, Fishpool, &c. There was also a deep den, surrounded by a hill, with a subterranean cave, which had been inhabited by a dragon, and was called Wurmenhert. This likewise Abbot Ealdred filled up and defaced, leaving, however, traces of its former condition. When Ealdred had collected together much materials, both of stones, tiles and wood, he died prematurely in the middle of his labours. His successor, Eadmer, continued the excavations. As the work-

men were digging up the walls and foundations of the old buildings they uncovered the foundations of a vast palace, and they found a hollow in the wall like a cupboard, in which were a number of books and rolls, which were written in ancient characters and language that could only be read by one learned monk named Unwona. He declared that they were written in the ancient British language, that they contained "the invocations and rites of the idolatrous citizens of Wærlamceaster," with the exception of one, which contained the authentic life of St. Alban. The abbot preserved the latter, and had it translated into Latin, and as soon as the translation was completed the original crumbled into dust. This story was probably in part a pious fraud, designed to give authority to the legend of the saint. That books were found is rendered probable by the fact of their being termed rolls, which we know was the form of books among the Romans, and not among the Saxons. The other part of the story is also probably a fable, that it appeared from these books that the two principal deities of the citizens of Verulamium were Phœbus and Mercury, "called by the English Woden," it being chiefly inhabited by merchants, of whom Mercury was the patron. These idolatrous books the abbot committed to the flames. "And as the abbot before mentioned diligently turned up the earth where the ruins of Verulamium appeared, and found squared stones with bricks and columns which he reserved for the erection of the church he proposed to build for St. Alban, the workmen found in the foundations of the old buildings pots and amphoras, elegantly formed of pottery and turned on the lathe, as well as glass vessels containing the ashes of the dead, for the ancients used to burn the bodies of their dead, whence the word *funus*, quasi *fumus*. There were also found the ruins of temples, altars overturned and idols, and various kinds of coins which were then used." The idols were, without doubt, Roman statues and bronzes. The abbot, with characteristic vandalism, ordered them all to be broken to pieces.

From these and other excavations on the same spot were probably derived some of the valuable gems enumerated in the inventories of the relics of the abbey of St. Albans preserved among the Cottonian MSS. One at least of these gems was an ancient cameo, of which a drawing was made by Matthew Paris. It appears from a life of the abbots of St. Albans that many other engraved cameos were in the possession of the abbey. The name cameo was itself of Mediæval formation. We find mention of them in many monastic inventories and other documents. In the inventory of the church of Anicy, made in 1444, we find a gold pontifical ring with a cameo, on which were four figures. In 1321, Geoffrey, Bishop of Laon, gave to his church a ring with a cameo. Among the precious stones adorning the mitre of the abbot of St. Victor at Marseilles in 1358 was a cameo with the figure of a man's face looking to the left. Other instances will be found in the Lexicon of Ducange. An immense number of cameos (*kamahutis*, *camautis*, &c.) and engraved gems appear among the ornaments and plate in the treasury of St. Paul's Cathedral in London in the year 1295. These engraved gems were frequently inserted in the counter-seals of secular and ecclesiastical personages of rank, and contrast singularly with the rude engravings of the seals themselves. A number of impressions of such counter-seals still existing are engraved in the plates of the first volume of the "Vetusta Monumenta."

People were eager to possess engraved stones because of the peculiar powers which were supposed to belong to them. Thus, a gem representing Pegasus, or Bellerophon, was good for warriors, and gave them boldness and swiftness in flight. One with a figure of Andromeda had the power of conciliating love between man and woman. A gem bearing the figure of Hercules slaying a lion or other monster was a singular defence to combatants. The figure of Mercury on a gem rendered the possessor wise and persuasive. The figure of Jupiter, with the body of a man and the head of a ram, made the man who bore it beloved by everybody, and he was sure to obtain everything he asked. A stone bearing the figure of a hare was a defence against the devil. A stone with a dog and a lion on it was a preservative against dropsy or pestilence. The figure of Orion was believed to give victory in war. A stone showing Perseus, holding in his right hand a sword and in his left the Gorgon's head, was taken to be a preservative against lightning and tempest and against the assaults of devils. A stone on which was engraved a long-bearded man sitting on a plough, with a bending in his neck, and four men lying down, and holding in his hands a fox and a vulture; this, if suspended about the neck, enables the possessor to find treasures. A dove with a branch of olive in its mouth, engraved in pyrites, attached to a silver ring, induced people to feast the wearer much and frequently. The figure of a syren, sculptured in a jacinth, rendered the bearer invisible. A fair head, well combed, with a handsome face, engraved on a gem, gave to the bearer joy, reverence and honour.

During the Middle Ages (and even up to a recent time) antiquities were always objects of superstition. Great earthworks or extraordinary structures were supposed to be the work of demons. Tumuli were guarded by dragons or were the abode of fairies. Ancient vessels needed consecrating before a Christian would dare to use them. Engraved gems were looked upon as magical amulets, and the finders endeavoured to preserve and take advantage of, rather than to dispel the charm. When they became an object of commerce it was the interest of the dealer to enhance their value by the display of their virtues.

GLASGOW ARCHITECTURAL ASSOCIATION.

At the monthly meeting of this Association a paper on "Structural Ironwork" was read by Mr. Andrew Robertson. The "graphic method" of determining strains in frames was first considered, this part being well illustrated by diagrams, and afterwards an indication was given of various ways in which iron might be used constructionally. It was advocated that architects should study mechanics, and familiarise themselves with the use of the material, so that they might with greater confidence carry out new forms of construction. The discussion of the paper was opened by Mr. William Cowie and taken part in by several other members, after which a cordial vote of thanks was awarded to the lecturer.

GLOUCESTER CATHEDRAL.

The annual meeting of the Bristol and Gloucestershire Archæological Society was held last week in Gloucester. After the transaction of business the Cathedral was visited.

The Dean expressed pleasure at meeting so important a body, and asked the assistance of the members in determining the date of the earlier part of the Cathedral, upon which there was a difference of opinion. The date of the crypt and ambulatory was left unsettled, Professor Freeman, who they knew was a good authority, preferring one date, while the late Mr. Gambier Parry, who took a vast interest in the matter and devoted much time to it, fixed another date. There were about seventy years difference between them, one believing that the crypt was built in the time of Edward the Confessor, and the other fixed the date after the Norman Conquest. Mr. Gambier Parry asked him never to give up the earlier date, but he (the Dean) felt if it were possible he should like to have definitely settled the date of the crypt and the ambulatory. Evesham Abbey, which was small, took about seventy years to build, and to say that Gloucester was completed in fifteen or sixteen years was out of all question. He was anxious to have the date decided, and if some member could get up a paper on the subject he should be glad.

The members then proceeded to the choir of the Cathedral, and the Rev. W. Bazeley read some notes on the east window. He said it was composed of two kinds of glass. In one the colour was in thick stripes, and in the other the work appeared as if it had been stippled. The upper part of the window was composed of silvery white glass with the yellow stain. He described the figures represented in the window as detailed by Mr. Winston, and published in many forms. The leading subject of the window was the enthronement of the Virgin, surrounded by our Saviour and angels, saints and apostles. In the tiers below these are figures of kings, ecclesiastics, earls, &c., and beneath these various emblazoned shields erected between 1347 and 1350 by Lord Bradeston, governor of Gloucester Castle, in honour of certain noblemen who had distinguished themselves in the wars in France under Edward III.

The Dean said that Professor Myddleton had written an elaborate monograph of the window, which, however, was not published. He ranked it very much higher than Winston did. It is 72 feet high by 38 feet wide. Its stonework exceeds in size the east window of York Cathedral; it is therefore reputed to be the largest window in the world.

In the lady chapel Mr. F. W. Waller, the hon. local secretary, exhibited large drawings showing the ground plan of the crypt, the floor of the Cathedral and the triforium, in which the casing of the perpendicular masonry of the choir was shown upon the original Norman church. He explained the peculiar architectural features which distinguished the connection of the east end of the choir with the lady chapel, which was erected at a later period. There was evidence that there were Early English windows in the crypt. He showed how the foundations for the later work which was carried up were inserted between the old Norman work. To obtain the enormous window which was desired the two last Norman piers continued from the nave could not be utilised, and two small pieces of masonry were put in, and to meet the thrust from the stonework above, which was required, the builders threw out a number of flying buttresses, so as to allow of the great addition to the choir to be made.

Rev. W. Bazeley read some notes on the early lady chapel. The present building was erected in the last half of the fifteenth

century, but the site on which it stood had doubtless been hallowed by the prayers of the faithful, he believed, as early as the seventh century. On Mr. Waller's plan he traced the line which the Roman wall took prior to the erection of the Cathedral, and referred to the additions and alterations made in the Cathedral at successive dates, as shown by the Early English groining and the reliquary, and the Decorated, Transition and Perpendicular work of the windows, &c. He next called attention to several interesting features in the lady chapel, and pointed out several of the old tiles which were set with modern ones, and with tombstones in the floor. Some of these showed the arms of Llanthony. Referring to the mutilated reredos, he said probably the figures in the niches were of silver. The stonework, which had been beautifully carved and adorned with colour, gilding and enamelling, had doubtless been destroyed at two different times. It was doubtful whether Oliver Cromwell had done so much damage to it as Thomas Cromwell had previously. He thought Oliver often got the discredit due to his predecessor. The present reredos was supposed to have been covered by another reredos.

An examination was made by the members of the lady chapel, and the side chapels with their beautiful fan-traceried ceilings and interesting monuments, as well as other portions of the Cathedral.

THE BORGHESE TREASURES.

THE correspondent of the *Standard* in Rome says he learns from a private source that much ingenuity had to be employed to effect the removal of the world-famous portrait of Cæsar Borgia from the Borghese Gallery. The portrait is attributed to Raphael, though many good judges think it more probably the work of Bronzino. It belonged to the "inalienable" portion of the Borghese Gallery which, according to the "Pacca" Edict of 1820, which has never been repealed, could not legally be taken out of the country. The place of the picture and of three others was altered in the catalogue. When the disappearance of the picture was ascertained Government circulars were sent to the frontier custom-houses, but just too late—the picture had passed the confines.

Some well-known dealers in antiquities in Rome have lately bought two hundred thousand francs' worth of furniture, pictures, vases, &c., appertaining to the *patrimonio libero* of the Borghese family. Several objects have already passed into the hands of a dealer in Florence, the rest will be sold during the coming winter in a building in the Villa Borghese, which has been hired for the purpose by the dealers in question. The famous table in precious antique marbles, supported by a group in gilt bronze, was singled out by a well-known collector, who wished to buy it separately, but the preference was given to the purchasers of the other articles *en bloc*, so it went to them. This table stood in the room of the mirrors in the Borghese Gallery. The heirs of Cardinal Antonelli have sold the famous collection of rock crystals which formerly belonged to Cardinal Giacomo Leperani.

EGYPTIAN EXPLORATION.

ON Monday Mr. Flinders Petrie addressed a public meeting in Manchester on the subject of his work in Egypt. He said that any visitor to Egypt would notice immense mounds of rubbish indicating the sites of towns. It had been thought that they were made on purpose, but they only resulted from the natural decay of the mud-brick buildings. These heaps of ruined walls and earth and potsherds rose even to 80 feet high in some places; but other ancient sites were much less imposing, and might even not attract notice on the open desert. The higher the mound the longer the place had been inhabited; and if the surface was of a late period the earlier parts, which were most needed, were under such a depth of rubbish as to be practically inaccessible. The slighter remains, therefore, which were all of one brief period, were the most important for study, being accessible and not confused with various ages one over the other. Much could be known at first sight, and prospecting had now become as scientific a matter in antiquities as in geology. On first walking over a mound the age of the surface could be known by the series of dated pottery and objects which had recently been collected from known epochs, and which were fully represented in the collections in Owens College. Knowing, then, by a glance at the sherds on the top what was the latest period of occupation of the site, and knowing the usual rate of accumulation of a mud-brick town—about 5 feet in a century—we could guess how far back the bottom of the mound must be dated. Other remains had different indications. If in the midst of a great mound there was a wide flat crater, that was probably the temple site, surrounded by houses which had accumulated high on all sides of it. If a mound had a long gentle slope on one side and steep on the other, it was probably a rubbish heap produced by people walking up one side and shooting baskets of rubbish over the "tip" edge. As to the process of excavation, he said that when a place had been decided on for work the men had to be got together. The best way was to form a camp and have all the workmen kept on the spot; thus each man became well known, his ways and his weaknesses could be noticed and used to the best advantage. The more an excavator kept in touch with all his men the better; the actual digger should be like an extra arm, every one wielded as directly as possible, and all acting as if the head was on the spot. For this end it was needful to give each man an idea of what he was working for, to trace out a building, to find a sculpture, or a tomb, or a town wall. He should be encouraged by a prophecy of what ought to be beneath his feet, and told what to expect, and how to act according to what he finds. This created confidence, and prevented things being ignorantly destroyed if the head was absent. Thus dealing with the men they gained an interest in the work, and became familiar with the meaning of what they found. They were also encouraged by giving every man the local value of all he found, besides his wages. Thus the presents they got as extras gave them the keenest care to preserve everything, and insured that they never secreted things to sell elsewhere. When, moreover, any lie or misstatement was always punished by irrevocable dismissal, they soon learned their own interests. In a short time they lived with the excavators almost like a large family; the few older men served to maintain a backbone. Most of the workers were lads of fifteen to twenty, with smaller boys to carry the earth. Kept continually under one's eye, they learned to come up with all their ailments and troubles, and his meals were generally interspersed with dosing indigestions and lotioning skin complaints. The cheerful, straightforward manner of the Egyptian, when he had no fear and knew that he would always get justice, made it a pleasure to work with them. They formed his guards and companions for months at a time, and he had a sincere liking and regard for them. The tangible results of this work had been before them so long at Owens College that he need hardly say anything about the actual objects found, but rather pass on to what was not yet formulated—the historical results. "The proper study of mankind is man," and whatever led us to know our species better could never be without value. We justly regarded every detail of life in other states of civilisation around us as of the greatest interest. Geographical ethnology was one of the most popular of subjects. And how much more valuable to us must be the history of our fathers, rather than of our cousins—the details of the rock whence we were hewn, the nature of our ancestors, which we have inherited, their products, their arts and skill. The products of their kindred races also, whose arts we had inherited, were of equal importance. A lad who was staying with him asked if he cared for history. He replied, "This is history." "Dear me; well, so it is. I never thought of that," was the answer of the boy. This was history; these objects, these arts—these were real history. What was all cut and dried in black and white was only the skeleton, the set of pigeon-holes for putting by the living history in the memory. In Egypt we now realised what the course of the arts of life had been. In the earliest days yet known to us—about 4,000 B.C.—we found great skill in executing accurate and massive stonework, such skill as had hardly ever been exceeded. We found elaborate tools used, jewelled saws and tubular drills. We saw the pictorial arts as fully developed as they were for thousands of years later. But what led up to this we were still feeling for.

Professor Boyd Dawkins moved a vote of thanks to Mr. Flinders Petrie for his address, which had shown, he said, what a vast department of human knowledge was to be explored by the intelligent operation of the pickaxe and the shovel.

Mr. H. H. Howorth, M.P., in seconding the vote of thanks, said that Mr. Flinders Petrie had made two remarkable discoveries. One was of a purely negative sort—he had dug a great deal in Egypt and failed to discover the beginnings of Egyptian art. In Egypt Minerva and all her train seemed to have appeared on the horizon fully equipped. The objects in wood and other material which had been discovered in Egypt showed an artistic skill equal to that of the most artistic race now living. But nothing had been found to show by what steps this perfection had been reached. The discoveries with which the name of Mr. Flinders Petrie would always be associated had thrown an enormous amount of light on the chronology of the art of the Eastern Greek world.

Professor Wilkins, as one of the local secretaries of the Egyptian Exploration Fund, said they would be glad to receive contributions in aid of the important work being carried on by the Society under the direction of Mr. Petrie.

Mr. Hoyle, curator of the Museum, said that a number of new objects had been added to the Egyptian Room, which had been found during the explorations last year. These would be in their places by the beginning of next week, and in the meantime the Egyptian Room was closed. Among the new things are some pottery which dates back to the Fourth Egyptian Dynasty—about 4,000 B.C.—some fragments of sculptures and a bronze implement.

SCHOOL BUILDINGS.

Carlisle.—The infant school erected in Brook Street for the Carlisle School Board has been opened. The buildings have been erected under the supervision of Mr. T. Taylor-Scott, F.R.I.B.A., the architect, with Mr. J. D. White as clerk of works. They present a handsome feature in the locality, the design being Gothic, with a well-broken outline and numerous gables and dormers, and being crowned with a large ornamental spire constructed on the ridge, and rising to a height of 60 feet above the ground. The material used is red Cumwhinton bricks and white stone dressings with Buttermere green slates. The contractors were :—Builder, Mr. John Laing ; joiner, Mr. J. H. Reed; plumber, Messrs. W. & R. M. Hill; plasterer, Messrs. R. M. Ormerod & Son ; slater, Mr. C. J. Nanson ; concrete floors, Messrs. S. Ferguson & Sons ; painter and glazier, Mr. Thomas Palmer ; furniture, Mr. J. H. Reed.

NEW BUILDINGS.

Blackburn.—The erection of the Nurses' Home behind the Blackburn and East Lancashire Infirmary will shortly be commenced, for the Building Committee have accepted the design of Messrs. Simpson & Duckworth, from plans from architects practising within the district served by the charity. The building will be of red brick, three storeys high. The ground plan shows a building consisting of three parallel blocks, connected by a corridor which runs through the entire structure. The main entrance to the home will be by a porch in the central block, and there will be a waiting-room on the left of the entrance-hall. Across the corridor, and at the other end of the block, will be the reading-room. In the same block will be the home sisters' sitting-room, and next to it will be the home sisters' bedroom. In the wing on the right will be the kitchen, scullery, box-rooms and the usual conveniences. The wing on the left will be entirely taken up with bedrooms and a bathroom for six private nurses. On the first floor there will be six bedrooms and a bathroom in the right wing for probationers, and in the left wing the same number of bedrooms and a bathroom for charge nurses. The central block will be taken up with a recreation-room. On the second floor there are to be bedrooms for six probationers in the right wing, and for six night-nurses in the left wing. In the centre will be placed the servants' bedrooms, another spare room, and a clothes-room. The architects' estimate of the cost is made up as follows :—139,950 cubic feet of building at 5½*d.*, 3,207*l.* ; cellar, 80*l.* ; foundations, 90*l.* ; covered way, 100*l.* ; total, 3,477*l.*

Durham.—A new theatre, concert hall and assembly rooms have been opened in the North Bailey. The theatre will accommodate about 700 persons. The stage is 22 feet by 17½ feet in dimensions, and in addition to the theatre itself there is a large supper or smoking-room, cloak-rooms, lavatories, dressing-rooms and other apartments. The building contains also large kitchen with pantry, cellars, caretaker's rooms, &c. The whole of the arrangements have been carried out by Mr. William Rushworth, architect, of London, brother of the proprietor. Messrs. G. Gradon & Sons, Durham, were the contractors.

Correspondence

Somerset House.

Sir,—I have been anxiously waiting for some one of eminence or influence to raise a protest against the vandalism of the authorities who are erecting at Somerset House the hideous enormity which is now spoiling the river façade of that noble building. I deeply regret that the complaint I thus initiate is not guided by some more influential pen, but in the absence of other protest I cannot remain silent. There is no finer urban prospect, there is no nobler architectural panorama in Europe than the line of magnificent buildings (seen best from the southern end of Waterloo Bridge), having Somerset House as the centre, and including the beautiful Gothic of Arundel House and of other buildings on the Duke of Norfolk's estate, the central offices of the London School Board, the Temple Library, Barry's characteristic structure in the Temple Gardens, Zion House and the City of London Schools. One after one these worthy buildings follow each other without a break, full of actual beauty, and stirring other builders to noble endeavour. Beyond them, but well in the prospect, are more distant glimpses of the pinnacles and towers of the Royal Palace of Justice, whilst many a spire and many a steeple rise from the haze above the roofs of the City until the view is crowned by the stately dome of great St. Paul's. On turning to the west, we see building after building of at least respectable merit, bounded at last by the towers of Westminster.

It is in the very heart of this grand view, unequalled in Paris or Vienna, and which even bears favourable comparison with the finest perspectives in Venice or Rome, that some barbarian (I know not who) is raising two monstrosities for some branch Governmental department, in the commonest brick, without the least appearance of ornament or design, and utterly devoid of architecture of any kind. To my mind the river front of Somerset House in its beautiful stone and stately style presents one of the most dignified aspects of any building in London. That there should be additions to this historic edifice in ugly common brick (above the sky-line), additions which have no relation whatever to the style or proportions of its parent building, is an emphatic disgrace that we must not, and cannot, permit.

If such an eyesore be allowed to blot what is unquestionably the most magnificent architectural prospect in Northern Europe, alas ! for all lovers of the beautiful ! Let our cities be abandoned to the jerry builder and let architects cease to aspire. The very numerous workmen who have laboured to raise upon the Thames Embankment buildings worthy of their manhood have laboured in vain.—I am, Sir, yours truly,

T. Mullett Ellis.

28 Essex Street, Strand, London :
October 14, 1891.

GENERAL.

The Autumn Exhibition of the Nineteenth-Century Art Society will be opened at the Conduit Street Galleries on Tuesday, the 27th inst.

An Altar, designed by Messrs. Pugin & Pugin, of Westminster, has been placed in the church of the Sacred Heart, Mount Vernon, Liverpool.

The late Mr. W. H. Smith was, it appears, the anonymous donor of 28,000*l.* for the erection of Portsea parish church, only 500*l.* of which he sent in his own name.

Plans for the proposed public baths at Montrose to the number of eighteen or twenty have been sent in by architects from various parts of the country.

The Architectural Class of the Glasgow and West of Scotland Technical College have begun a series of visits for measuring and sketching in Glasgow Cathedral under the direction of Mr. C. Gourlay, Associate of the Institute of Architects.

Plans have been adopted by the Council of the Yorkshire College for the proposed college hall and library and for the new medical department, at an estimated total cost of nearly 50,000*l.*

Mr. James Maxwell (Maxwell & Tuke, architects), the designer of the Blackpool Tower, has been appointed Justice of the Peace for Bury.

Mr. Guy, of Southsea, whose designs were selected in competition for the proposed new library buildings at Southampton, has been authorised to complete his plans and prepare specifications for the work.

Plans submitted in competition by Mr. H. B. Buckley, of East Parade, Leeds, for Technical Schools, Batley, have been selected, and the work is to be carried out at once.

The Foundation-Stone of the Sheffield Municipal Buildings, of which Mr. Mountford is the architect, has been laid.

Mr. William Dunn intends to purchase an open piece of ground at the top of St. Mirren Street, Paisley, at a cost of 4,000*l.*, and lay it out as a public park.

The Wolverhampton Town Council, in recognition of his services to the borough, have decided to ask Mr. H. H. Fowler, M.P., to let his portrait be painted and hung in the Council Chamber, and, further, to allow the Corporation present him with the freedom of the borough.

New Schools have been erected at Burnley Wood for the Burnley School Board, and special attention has been paid to the ventilation, the appliances of the "Climax" Ventilating Company, 15 Great George Street, Westminster, having been adopted by the architect, Mr. G. E. T. Laurence, A.R.I.B.A., of London.

The Engineers and Architects' Institute of Vienna have resolved to petition the Austrian Government that engineer attachés should in future be appointed to the embassies and legations in London, Berlin, Paris, St. Petersburg, Rome, Washington and to one Oriental city to be hereafter selected.

Three Colossal Statues, 10 feet in height, of rose granite, have been found at Aboukir, a few feet below the surface. The discovery was made, says the *Times* correspondent, from indications furnished to the Government by a local *savant*, Daninos Pasha. The first two represent in one group Rameses II. and Queen Hentmara seated on the same throne, which is unique among Egyptian statues. The third statue represents Rameses standing upright in military attire, a sceptre in his hand and a crown upon his head. Both bear hieroglyphic inscriptions, and both have been thrown from their pedestals face downwards. Their site is on the ancient Cape Zephyrium, near the remains of the Temple of Venus at Arsinoe.

The Architect.

THE WEEK.

France possesses eighty-seven cathedrals of which the conservation devolves on the Government. They were formerly under the charge of seventy-five diocesan architects, who were selected by the Ministers; but of late years there are only sixty employed. Since 1884 the vacancies among diocesan architects have been filled by the aid of competitions, and it is the endeavour to secure architects who are zealous for Gothic. As the style is no longer in vogue, the number of competent candidates is being gradually diminished. The office is not attractive on account of its emoluments. As a rule, the Chamber does not vote more than two millions of francs a year for the restoration of the cathedrals. A commission of 5 per cent. on that sum would produce 4,900*l.*, or about 66*l.* for each architect, a sum which is far from being remunerative for such onerous responsibility as has to be undertaken. The position is, of course, a token of ability and worth, and on that account becomes valuable in a country such as France, where officialdom is respected. Accordingly, in the competition which has been held for six appointments, twenty-six candidates were nominated, but only ten appeared. The examiners were MM. de Baudot, Vaudremer, Corroyer, Bœswillwald, Darcy and Pascal, architects who are associated with the Department, with M. Dumay as president. As a test, it was supposed that some church, belonging to the period between the eleventh and sixteenth centuries, was partially destroyed by fire, and the competitors were to describe fully the restoration proposed. Each competitor was to select a church with which he was acquainted, in order that the projects might not be altogether imaginative. The following architects were selected:—MM. Benouville, Marcel, Roy, Laffillée, de Perthes and Balleyguier. As there are only two vacancies at present, M. Benouville and M. Marcel were appointed, the others will follow in succession.

The Yorkshire College has been enriched by grants from the Leeds Borough County Council, and in consequence extraordinary facilities for education in industrial subjects are now available for students. Instruction in technical electricity is to be obtained by paying 10*s.* 6*d.* for lectures and 1*l.* 10*s.* for a laboratory course. Free courses of lectures are also to be given, and among the subjects are "The Use of Plant Form in Design," "The Principles of Design" and "Textile Design." There is also a course on "Sanitary Engineering." Fifty evening scholarships of the value of 2*l.* each are also to be offered in competition. When are the humbler classes of students in London to have similar opportunities?

The annual meeting of the Glasgow Institute of Architects was held on Tuesday, when the Council submitted the twenty-third annual report, which showed that the number of ordinary members on the roll at present stood at forty-nine, and there were eight honorary members, making fifty-seven in all. Mr. Leiper, in moving the adoption of the report, said he was sure there were members of the profession still outside who might be induced to join the society. He regretted that the proposal that the Institute should have a home of its own had not found favour with the majority, but they did not despair of its being accomplished. The Institute did not support the application of the Society of Architects for registration, as they considered that the Royal Institute already fulfilled all that was needful. Touching on the education of young architects, he remarked that a distinct advance had been made in this respect, and of four local candidates who went up for examination recently three had passed. After referring to the Building Act, to assist which the Institute prepared a draft Bill and forwarded it to the Clerk of Police, Mr. Leiper referred to the important architectural project in which they were interested locally, namely, the new Fine Art Gallery, Museum and Music-hall. A school of design under the same roof would be an immense advantage, as the objects of art sent from South Kensington and elsewhere could be conveniently studied. Referring to the growing use of red stone and terra-cotta in Glasgow buildings, he said this was rather remarkable in a city where formerly only white stone was tolerated. No doubt the reason was that hardly any of our white stones would stand an atmosphere laden with acids and smoke, while it was found that as a rule the red stone resisted more effectually the deleterious effects of the town atmosphere, and that white stone after a time became a dismal black. He thought that some better method of preserving the white stone should be resorted to than painting them. In Paris hot jets of steam were used once a year to clean out the soot and dirt which gathered on the fronts. That there was no committee of taste in Glasgow was due to the fact that beauty must give way to utility, which with its iron plough overturned the fine flower of architecture and destroyed vistas and fine parks and gardens.

Is it a ruse which inspires so many versions of the sales in the Borgia Gallery at Rome? According to some authorities the contents of the gallery remain unaltered, as the Duke de Romarzo has too much reverence for the Commission of Fine Arts to infringe the regulations against sending works of art out of Italy. Then it is stated that the Duke has certainly sold a portrait of Cæsar Borgia for 24,000*l.*; while according to another account it was the Duke's son who was the vendor, and the picture sold is not a portrait by Raphael, and does not represent the wicked prince that was idolised by artists and poets. In that case, as it is not an object of exceptional value, it does not come under the terms of the Pacca edict. There is no doubt the pictures are not visible to strangers, but this is explained by saying that they are about to be removed to another part of the palace, owing to the dampness of the gallery in which they were hung. The statements cannot all be true, and before they are reconciled it is not impossible that some of the masterpieces may have to be conveyed out of Rome and towards Paris, in order that they may be secure against atmospheric and other dangers which menace such works.

The Brown Book of the Architectural Association for the present session is a thicker volume than its predecessors, on account of the syllabus which is included. There are several changes recorded, and there are other signs of the new experiment. The following papers are to be read during the session:—"Pitfalls on commencing Practice," Mr. W. H. Bidlake; "Frame Houses," Mr. C. H. Brodie; "Concerning John D. Sedding, his Work and Influence," Mr. H. Wilson; "Some Suggestions for the Practical Education of an Architect," Mr. T. G. Jackson; "The Design and Equipment of Technical Schools and Colleges," Professor Garnett; "Fashion in Architecture and Art, with Remarks on its Effect on Mural Painting and Painted Glass," Mr. N. H. J. Westlake; "Suggestive Domestic Work seen in past A.A. Excursions" (with lantern illustrations), Mr. Maurice B. Adams; "Domestic Electric Lighting," Mr. Max. Clarke; "How they Built in Shakespeare's Time" (with lantern illustrations), Mr. J. Alfred Gotch; "The Planning of Theatres," Mr. E. A. E. Woodrow. The work of the Association will be carried on at 56 Great Marlborough Street, with the exception of the general meetings, which will be held at 9 Conduit Street.

Although the Luxembourg Palace in Paris dates from the beginning of the seventeenth century, the chapel was not completed until 1844, under the Government of Louis Philippe. The chapel has remained unused since the Republic was established, but it is about to be reopened for service. It has been assigned to the Maronites, and as the Greeks have obtained possession of the church of St. Julien le Pauvre, there will be two of the semi-independent branches of the church of Rome worshipping in the same district of Paris. In the church are several large paintings by the modern masters Jean Gigoux, Vauchelet, Abel de Pujol, and sculpture by Jaley and others. The works have been cleaned and restored where necessary, and it is expected the chapel will appear bright and cheerful.

THE RIVER, FROM THE CUSTOM HOUSE TO RICHMOND; OR, A CHAT ABOUT SOME BRIDGES.—III.

[By a Correspondent.]

AFTER passing by Wandsworth Bridge the lovely grounds of Hurlingham House come in view, and then one sees that most useful and convenient railway bridge at Putney, which enables the dweller in the western suburbs to readily obtain access to the rural neighbourhood near Wimbledon. Would that this structure were more in harmony with the surroundings, such as the fine elms on the Middlesex bank! But it would be as wise to talk to the winds as to endeavour to persuade a railway company that it is advisable to study the beautiful as far as possible. For the dividends are not affected because an ugly bridge or viaduct spoils a pretty view and is an eyesore to its immediate neighbourhood. The value of some land near by may be diminished, but, on the other hand, in consequence of the convenience of access, plots near the station become more sought after and are soon occupied. This Putney railway bridge is of much the same character as the road bridge at Wandsworth, *mutatis mutandum*, and is carried on huge piers. There is really not much more to be said about it, except it is rather irritating that, owing to the arrangement of the lattice girders, no one can get a good view of this interesting part of the river. However, this is better than at the Britannia tubular bridge, Menai Straits, or the Conway railway bridge, where all is darkness. In the old-fashioned structures the view was always quite uninterrupted.

There could scarcely be a greater contrast than the new bridge at Putney and the old one it superseded. As a rule the antiquary must lament the destruction of objects of the past. But in this instance there was in truth nothing very picturesque in this old timber erection, except possibly the cut-waters, which, being carried up the whole height of the bridge, also offered an agreeable place to the lounger. But, being of Baltic fir and not of English oak, it had none of that pleasing grey hue matured by long exposure to the weather. This bridge always gave the impression of having been originally intended for temporary use, and afterwards being allowed to stand, thus acquiring the status of a permanent structure. When first the writer saw the new bridge on a bright day in August, soon after it had been opened for traffic, the grey granite looked almost dazzling, but since that short period the gentle hand of Time has already subdued it to a more sober tint. There are three bold arches of considerable span, with a pleasing rise in the centre, though withal an easy gradient for the traffic, and a good proportion of simple parts. Not much more can be said of the design, for it needs no lengthy description any more than does London Bridge. Good materials, much ability of construction—such are the elements to tell in a bridge. But it is a pity to run a risk of "spoiling the ship for a ha'porth of tar." The small semicircular arches in the approaches on both the Middlesex and Surrey side are of ordinary stock-bricks. This cannot very well be "built out," and the only thing to do would be to let the ivy grow; at present the effect is decidedly bad.

And now for "the other side of the shield." The writer on the particular occasion when he had been admiring the elegance of this Bazalgettian structure, strolled by the evening sunlight along the towing-path on the Surrey side by the grand semicircular sweep of the Thames past Barnes Elms to the suspension bridge at Hammersmith. In this example some of the sins of the civil engineer, architecturally speaking, are exhibited. Cast-iron legitimately treated to suit the material, and not as if it was masonry, can, of course, be made to look well. But the immense piers here have very large capitals of a kind of Early English character. Above them we see a species of turret from which the heavy chains with their great bolts are hung. The arrangement of the footways for passengers is unusual, as they are entirely separate from the carriage-roadway, slung out on one side from the chains. The construction of suspension bridges is particularly interesting, because, unlike the hideous box-girder railway bridges, nearly everything is visible and can be studied. The theory of the earlier revivalists of Gothic architecture is now almost extinct, *i.e.* that all construction should invariably be shown, never mind if it were ugly (and therefore better veiled) or elegant. This was, of course, "riding the hobby-horse too hard." To conclude with this bridge, the balustrade is on the latticework principle, and the masonry piers below the roadway are continuous transversely.

After this bridge it is not to be wondered that there is a longish interval before the next, looking at the surroundings of the river and the sparse population on its banks, though that is not the case for very far. The next is for the South-Western Railway, at Barnes, so useful for those who want to witness the finish of the University Boat-race, and have the privilege of standing there while the trains cease to run. It seems almost malicious to say that those who are on it then do not miss much from not seeing its artistic features beneath, which may be called *nil*. But there is nothing whatever objectionable or offensive in the design. It is very plain; the upper part of the piers of ordinary stock bricks, which do not seem to do well in such a position. There is an arched iron construction of the usual type of railway bridges of the period when this structure was completed, and the spandrils are pierced, having simply vertical semicircular-headed panels. The balustrade forms no feature, having a solid front and nothing to show where it begins and ends, looked at externally.

The next bridge is for the South-Western Railway, between Gunnersbury and Kew Gardens. This is one of the usual type for such purposes, and calls for no particular comment. It is plain, but not ugly, because no attempt at so-called ornamentation has been made. At the same time, one cannot but wish it were possible to design railway bridges on some principle which would be satisfactory to the shareholders and also give a more pleasing picture to the eyes of the ordinary members of the public. New inventions come in so quickly now that it is not impossible this wish may be fulfilled ere long.

The old bridge at Kew is so quietly picturesque and so familiar to the lovers of the Thames that its threatened destruction to meet the exigencies of the constantly increasing traffic, and the proposal for a new structure to take its place, is greatly to be lamented. Even though its successor were as well designed as the new Putney bridge, it never could have the charm of the present one, except possibly to our great-grandchildren. As the steep gradient is one of the great objections to Kew Bridge, the mere widening of it would not be acceptable, and, for the reasons stated at the commencement of this article, would to some extent injure its effectiveness, architecturally. To build another bridge near by, irrespective of financial and other practical reasons, would also damage the old structure from an artistic point. A tunnel would be too costly, and not be popular, independent of the expense and difficulty with the approaches. The only possible way to preserve the bridge would be to rebuild it on some other part of the river not far off, where the traffic was not so great. This would not be more unreasonable than was the transportation of Temple Bar to a private park. One of the attractive features of Kew Bridge is its seven arches, an unusual number. The steep rise up to the centre is also pleasing to the eye. The central arch has a keystone; not so the others. Whether this was or was not so originally is immaterial, for the centre is not unfittingly thus marked. The main piers carrying the bridge are quite plain in the lower part, but have simple panels at the parapet level, and there are other subsidiary piers to the balustrade. The balusters individually are somewhat slight looking, but their general effect is good.

Passing the picturesque old buildings adjoining Kew Gardens, then Sion House and the quaint houses at Isleworth, the South-Western railway bridge at Richmond comes into view. This is of much the same type as that at Barnes, with massive piers below where the iron arches spring, and stock brick above that level. The spandrils are pierced, but the parapet not so; it is quite plain.

The last example to be commented on by the writer is that one so familiar to most Londoners, but which always seems fresh—the old bridge at Richmond. This differs from its sister bridge at Kew in having only five arches instead of seven. The rise of the roadway in the centre is also not so great, and the parapet is straight-lined at the top, a very obtuse angle in the centre being thus formed. The piers are bow-shaped, the bow being rather a flat one,

with a small square pier on either side, to form a re-entering angle into the main part of the bridge, which is a great help to the effect. Unless projections on a plan based on the circle are semicircular they look poor, and where it is impracticable to get that, the scheme adopted at Kew is an excellent one. As these piers are carried up the whole height, they are useful in forming little recesses for foot-passengers, largely used in such a situation, where the prospect is so cheerful and in every way beautiful. The balusters to the bridge parapet are of rather rustic design, not by any means brilliant specimens of "Roman" work, but that is not material where the general effect of the design is pleasing. On the Surrey side the appearance of the balustrade near the bank has been rather injured, owing to the level of the roadway having been raised and the parapet also, on the inside, leaving the original raking line externally and the balusters "engaged." This was clearly done for the convenience of the traffic, avoiding what was formerly a slight dip in the road leading into the main street of Richmond.

It has been a very pleasing occupation to the writer to jot down his impressions of these various bridges from the Custom House to Richmond, and he trusts that as an architect he has said nothing ill-natured to civil engineers in these candid criticisms on what is a subject of public interest. Would that it were practicable to have an architect called in for consultation before a design for a bridge was finally adopted, or some such arrangement as existed between Mr. Haywood, the City engineer, and the late Sir Horace Jones, in respect to the Holborn Viaduct and the Tower Bridge, where the good effect of the employment of an architect, in combination with an engineer, was very apparent. For bridges over a large powerful tidal stream, like the Thames below Teddington, the skill of a member of the last-named profession is no doubt required, and it would be absurd at the present time for the architect to claim the building of such structures as his prerogative. Yet it seems a pity he could not be permitted to have some little share in the artistic part, leaving the civil engineer to grapple with the main constructional difficulties.

FRANCESCO ALGAROTTI.

WHENEVER Mr. Carlyle expends his verbal wealth in blackening the character of people, it is generally wise to avoid accepting what he says without further examination. Although he is never more amusing than when employing his pen on that sort of work, he was not on those occasions in a condition to do justice to anybody, living or dead, against whom he had the slightest grudge. His intentions were generally honest enough, but a man who, while he believes he has a mission as a saviour of society, is compelled to suffer from a diseased liver and a hypochondriacal wife, like the commonest mortal, cannot always be expected to be in an equitable state of mind. When Carlyle was bilious anybody's reputation might suffer. In the case of Algarotti, there were two or three reasons to embitter his mind against a man who had ceased to affect the world for more than a century.

In the eighteenth century there was no more acute connoisseur in all that relates to the fine arts than Algarotti. He was inflamed with that "worship of the beautiful" which Carlyle considered to be an intolerable hypocrisy—nay, "doubly intolerable, because it is not an obliged hypocrisy, but a voluntary one." Algarotti, who was one of the last of those who took all knowledge for their province, besides the treatises on military art, the Newtonian theory, philology, politics, and other subjects, in his seventeen volumes, did also, as became an Italian, write upon architecture, sculpture and painting, and for displaying a love of art so openly he became obnoxious a century afterwards to Mr. Carlyle. His prejudice against Algarotti was expressed in his "Frederick the Great," when he wrote:—"To me he is not supremely beautiful, though much the gentleman in manners as in ruffles, and ingeniously logical: rather yellow to me, in mind as in skin, and with a taint of obsolete Venetian macassar. But to Friedrich he is thrice dear; who loves the sharp-facetted cut of the man, and does not object to his yellow or extinct-macassar qualities of mind."

This passage reveals the second reason for Carlyle's manner of judging Algarotti. It is evident from what he says that he was jealous of the influence which the Italian possessed long before at the King's court. Biographers are often subject to that strange sort of delusion; and, moreover, Carlyle must have felt that if Frederick were living in London he was not likely to pay many visits to Cheyne Row, and would prefer the society of the *dilettante* person who "pleased him beyond measure," of whom he declared there was no human creature comparable with him, although nature gave him "a big hook nose, and dusky, solemnly greedy countenance," and for whose genius he would willingly give "ten cubic leagues of ground." But intimate as he was with the King, he did not divulge much about Frederick's private life or conversations, and accordingly he left no materials which an historian could turn to account. It is no wonder, therefore, Carlyle did not love a man who let slip so many opportunities for recording the tittle-tattle of the Court. Another reason for the treatment of Algarotti arose from the exigencies of composition. Carlyle, who was a master in arranging contrasts, wished to enhance his hero's manliness by surrounding him with people who were not possessed of the first qualification for a soldier. It is therefore suggested that Algarotti was a coward, and from that defect many others issued.

As Carlyle is the only writer of note of late years who has given any attention to Algarotti, it is well to suggest that what he writes is not an impartial sort of judgment. Any of the books which bear the Italian's name will show that, with all his love of art, he was not deceitful, or of the windbag species. In England there is an obligation to think kindly of the courtly and learned gentleman that was known in Frederick's court as the Swan of Padua. He was one of the few foreigners of his age who admired Englishmen. In an address to the Society of Arts, a couple of years before his death, he placed the English on the same level with the ancient Romans. England, he said, could claim superiority in arts, arms and science, as well as in agriculture and architecture, the two arts which most contribute to the strength and splendour of a State, one being the sovereign of the polite arts, the other their nurse. He also assumed that the art of painting, which, in 1762, was exciting much interest (the first exhibition was held in 1760), would flourish in London as formerly in Parma, Venice and Rome. There are few examples of such genuine admiration for England as is to be found in Algarotti's books and letters. His sanguine views about the future state of art in this country was contrary to the dicta of the critics of that age.

In another way Algarotti was in advance of his contemporaries, and that was in advocating a system of education for artists that differed from what was followed in the eighteenth century. His principles will be suggested by glancing at that part of his teaching which related to painting.

He started with a suggestion that should have recommended him to Carlyle above all men. Algarotti believed that the individual should succumb to the State, and that it was the business of government rather than of parents and guardians to settle the course of life which children should follow. The selection was not to be made in a haphazard fashion, but by means of able men who were to visit the public schools and observe the tendencies of the students. Children who were considered to have qualifications for painting were to be at once placed in training. The only books used for reading lessons were to be biographies of artists. In the earliest drawing-lessons the finest examples were to be set before the children, in order that from the beginning the students should be impressed with the importance of beauty. Algarotti was opposed to a long course of copying from drawings, and he recommended that Greek and Roman models should be substituted at an early stage for the sake of the fine contours and in order that the necessity of light and shade should be impressed on the mind. Whatever kind of exercise was adopted, the student was to be made to go through it carefully, but at the same time he was to be induced to find pleasure in his work, for Algarotti, like Macbeth, believed that "the labour we delight in physics pain."

A knowledge of anatomy, as far as regards the bones

and muscles, was also insisted on as indispensable for the student. The casts of the figure by Hercules Lelli were recommended, but Algarotti suggested that it would be an improvement if different colours were used for the muscles, in order that those in the arm, back and elsewhere should not be confused. One of the exercises recommended by Algarotti was the taking of part of a figure, such as the thigh of *Laocoon*, and to follow out the action of the muscles by completing the leg. He believed that the safest course to follow in the arts was from theory to practice, and this faith inspires whatever he wrote about anatomy and perspective.

It might be said that the love of ancient work was an essential part of his theory. To Algarotti Greek sculpture was perfection, and the *Apollo of the Belvedere*, the *Laocoon*, the *Venus Medicis*, the *Faun* and the *Antinous* afforded canons of art for the painter. He maintained that new beauties were to be discovered in them as often as they were studied. That the Greeks were not as successful as Fiammingo in representing very young children, which was a belief among Italian painters, was taken by Algarotti to be evidence of their love of beauty. Until children reached the age of four or five years their contours and proportions were not considered as definite, and on that account the Greeks avoided them as subjects.

He upheld the necessity of every painter possessing some such ideal figure in his mind as Raphael professed always to have before him. Algarotti, therefore, was opposed to the practice of copying the nude by young students. He would keep them back until it was shown they possessed some acquaintance with symmetry and proportion. If he were living now he could point to many deviations from the right way in support of his theory. The endeavour to produce most realistic representations of models has caused many men to imagine that art is no more than the record of defective forms, and that nature is to be typified by a human frame that cannot reach its full development on account of social grievances. There is not a school or "ism" in France which has not originated in life studies, and in the setting up of individual peculiarities as superior to idealised forms.

His studies of Newton would be enough to make Algarotti a student of the mysteries of colour and to recommend a scientific study of the phenomena. But with all his attention to the prism, he maintained that science must yield to art, and that Giorgione and Titian discovered appearances which to others were concealed. The works of Titian could not he said be too much studied. In the eighteenth century there was a turning to nature as the only guide in all things, and this is seen from the earnestness with which Algarotti recommends the use of the *camera obscura* for painters. He says the best painters in Italy were then employing it, and that the success of Spagnoletto, of Bologna, was to be ascribed to it. One master said that an academy could be set up and flourish with the aid of a *camera obscura*, a copy of Da Vinci's "Treatise on Painting," a critical account of painters, and a few casts of Greek statues. The advantages of the *camera obscura* are no longer appreciated by painters, but it would be unfair to blame the men who in the eighteenth century prized it. At a time when pictorial landscapes were made up of conventionalities it was well to have something brought into use that was a true reflection of a real scene. Even Gainsborough, who was a lover of nature, was so much a slave to the practice of composing landscapes, that he "framed a kind of model of landscapes on his table composed of broken stones, dried herbs and pieces of broken glass, which he magnified and improved into rocks, trees and water." In his case those objects may have recalled scenes in the country, but there were landscapists who seemed to be above thinking of nature. For men of that class the *camera obscura*, which the Italians claim as an invention of Leon Battista Alberti, would be corrective and a stimulant to a proper mode of study.

But it must not be supposed that "the ingenious and able Algarotti," as Macaulay describes him, was an advocate for the direct reproduction of a landscape by the aid of an optical instrument. He always insisted that the business of the painter consists in the endeavour to produce probable scenes and not scenes that are exact copies of reality. The painter, like the poet, should have imagination and know how to exercise it. The ancient painters on that account were more happy than modern men, for, as Algarotti pointed out, the world was supposed to be filled with gods and goddesses, fauns and nymphs, tritons and nereids, who took part in human affairs. The Greek painter, although "suckled in a creed forlorn," could have those glimpses which Wordsworth longed for, while living amidst the mountains—the "sight of Proteus rising from the sea" and other delightful scenes. There was no system of ethics which enjoined mortification of the senses, and whatever he saw and which gave him delight he was able to depict without fear of present or future punishment. It was impossible to bring back Classic days, and as the best substitute Algarotti recommended painters to study the Classic authors and the poets, in order to excite their imagination. He points out how Michel Angelo earnestly studied Dante, and on the margin of his volume drew illustrations of the scenes, thus making it inestimable, and worthy of the library of the greatest monarch.

In fact, Algarotti expresses the principles which were followed by the greatest artists, and to condemn him as if he were only a Frenchified *beaux esprit*, as has been done by his countryman Gioberti and many others, is to say that the history of art in Greece and Italy is only a delusion. He was no formalist with a series of technical rules, and he certainly was free from any superstition of style, unless his admiration of the Greeks and the great masters of Italy could be so termed. His ambition was to raise his countrymen out of the depths of mediocrity, and if he failed his efforts merit respect.

THE IMPERIAL MUSEUM, VIENNA.

THE new Imperial Museum of Art, in the Ring Strasse, Vienna, opposite the old Palace of the Hofburg, opened by the Emperor, is, in its external aspect, says the correspondent of the *Standard*, an exact counterpart of the Natural History Museum opened last year, from which it is divided by a spacious square, in the centre of which stands the Maria Theresa Monument. The edifice has been in the hands of Baron Hasenauer, the architect, for no less than sixteen years, though, like the corresponding museum, it has been externally finished for the last ten years. The interval has been employed on the decorations of the interior, of whose lavish richness and beauty probably very few people have any idea, unless they have visited the building, which was opened last year.

Every sculptor and painter of note who has lived in Vienna for the last ten years has been employed, more or less, in assisting in the embellishment of this Museum of Art. The late celebrated Austrian artist, Herr Makart, is well represented in the works of art which adorn the walls and ceilings of the Museum. The Hungarian painter, Herr Munkacsy, has a painting on the ceiling in the great entrance hall, representing the apotheosis of Art, which forms one of the principal attractions of the building. This picture was painted on one piece of canvas, woven especially for the purpose, and so large that the painter had to have a special house built to enable him to work on it. Opinions differ as to the correctness of the painting in point of perspective when looked at from below, but he who only knows Munkacsy from his other paintings will hardly recognise him in the bright and joyous light in which he has here represented Italian art.

The entrance-hall shows another celebrated work of art, to wit, Canova's marble group of *Theseus and the Centaur*, which for many years stood in a special Greek temple in the Volks Garten here. On its removal to this Museum last year it unfortunately suffered serious damage from the clumsiness of the mode of transit. This group stands on the first landing of the grand staircase. The dimensions of the entrance-hall may be gathered from the fact that this immense group by Canova appears dwarfed to only a medium size. The ground floor to the right and left of the entrance-hall leads to the collections of Roman, Greek, Mediæval and Renaissance antiquities, to the Egyptian Museum, to the collection of Greek vases, antique bronzes, cut stones and coins, and to the very important collection of objects of old art industry, altogether occupying thirty-nine large rooms. In the basement are the celebrated Princes' Tombs, with unique reliefs, found in Lycia, in Asia Minor.

The principal part of the Museum is, however, the first floor, with fourteen very large and nineteen smaller rooms. They are on either side of the splendid circular hall that is surmounted by a lofty cupola. The first floor contains the Imperial Picture Gallery, with 1,735 old masters and about 300 new masters. With the exception of about 150 old masters, including paintings by Titian, Veronese, Velasquez,

Rubens, Dürer and others, for which no room could hitherto be found, and which had till now been hidden away, all the works in this collection are well known and, indeed, famous throughout the world as the former gallery of the Vienna Belvedere.

It is hardly possible to describe how greatly the numerous celebrated pictures of this gallery—for instance, the Rubens Collection—have gained in colour and effect by their new surroundings. The splendid roof-light is common to all the central halls, while the smaller rooms on each side have side lights. These collections will be thrown open in a fortnight hence, from which date the public will be admitted four times a week free of charge.

The second floor has twelve rooms, containing a very fine collection of water-colours from the various Imperial palaces. Very few people in Vienna had any knowledge of the existence of these works. The Museum will altogether unite what has hitherto been scattered all over the city, including the Belvedere Gallery, the Ambraser Collection, the Imperial Armoury, and the larger part of the celebrated Wiener Schatzkammer in the old Hofburg. In addition to these, whatever was found in the Imperial palaces and castles throughout Austria worthy of a place has been included with these better-known collections.

All the contents of the Art Museum, as well as the Natural History Museum, together with the buildings themselves, are the private property of the Emperor, who, by help of munificent grants from his Civil List, is every year adding to the already very rich collections of the Imperial house.

REGISTRATION IN MELBOURNE.

THE following is a draft outline of the Bill for the registration of practitioners in architecture, which it is proposed to introduce in the Victorian Parliament :—

Whereas it is expedient that provision be made for the registration of persons qualified to practise as architects in the Colony of Victoria. Be it therefore enacted, &c.

1. A Council shall be established styled "The General Council of Architectural Education and Registration of Architects entitled to Practise in Victoria," hereinafter referred to as the "General Council."

2. Members of General Council to be eight in all—three nominated by the Royal Victorian Institute of Architects, one by the Architectural and Engineering Association of Victoria, one by the Melbourne University, one by the Governor-in-Council, and, after registration has been completed, two by the general body of registered practitioners. Persons nominated to serve on the first General Council to satisfy the Attorney-General that they are qualified to be registered under this Act. Each member of subsequent General Councils to be a registered practitioner. All members of first General Council to hold office for four years from appointment, and thereafter one member (not being one appointed by Governor-in-Council or by the Melbourne University) to retire in each year, but to be eligible for reappointment.

3. Duties of General Council.—To keep a register of qualified architects ; to remove names therefrom for misdemeanour or disgraceful professional conduct, &c. (N.B.—Draftsman of this Bill requested to consider this clause) ; to direct the holding of examinations in architecture ; to appoint examiners in architecture ; to make all necessary regulations for the proper carrying out of the purposes of the Act ; names and addresses of all newly-registered practitioners to be published within one month of registration in the *Government Gazette*, and in the month of September in each year a complete list to date to be therein published. (N.B.—Draftsman of this Bill requested to consider whether names struck off roll be published in *Gazette*.)

4. Persons qualified to be registered at the time of the passing of this Act.—(1) Those who at date of the passing of this Act are fellows or associates (other than honorary fellows or associates) of the Royal Institute of British Architects, or of the Royal Victorian Institute of Architects. (2) Any person of the age of twenty-five years who for the three (3) years immediately preceding the passing of this Act was *bonâ fide* engaged in practice as an architect in the colony of Victoria as a principal. (3) Any person of the age of twenty-five years who has served as pupil or assistant to an architect, or has been in practice as an architect, all or either, for seven (7) years in the aggregate prior to the passing of this Act. Classes 1, 2 and 3 to satisfy the General Council by such evidence as it may require of their right to registration under these provisions. (4) Application for registration under this section 4 must be made within six months after passing of this Act.

5. Persons entitled to be registered after passing of the Act must—(1) Be twenty-one years of age. (2) Have served apprenticeship (indentures) of four years with registered practitioner and passed qualifying examinations except as hereafter mentioned. (3) A person who before passing of this Act has entered upon or completed apprenticeship for a shorter term than four years with master qualified to be registered under this Act may serve the additional period to make up four years with a registered practitioner, and shall pass prescribed qualifying examination. (4) Any person of the age of twenty-five years who has been engaged in *bonâ fide* practice as an architect in the colony of Victoria as a principal for a period of less than three (3) years but not less than twelve (12) months prior to the passing of this Act shall, on passing the prescribed qualifying examination, be entitled to be registered. (5) Any person of the age of twenty-five years who has had not less than seven (7) years' experience in architectural office work to the satisfaction of the General Council and has passed qualifying examination shall be entitled to be registered. (6) Nothing herein contained shall prevent the General Council from reducing the term of architectural office experience required in clause 5 prior to examination to not less than two (2) years in the case of persons of the age of twenty-five years who can produce to the General Council such certificate or diploma of a university or technical school as may be recognised by them as of sufficient value to entitle such a person to this reduction of office service, provided that such university or technical school experience is of not less than three years' duration. (7) Provided that any person, whether a British subject or not, who either is or is not domiciled in Victoria, but who has practised as a principal architect elsewhere than in Victoria, showing to the General Council that he holds such a certificate, diploma, or other document as may be recognised by the Council as furnishing sufficient guarantee of the possession of the requisite knowledge and skill for efficient practice as an architect, and who can show that he is of good character, shall, on payment of registration fees, be entitled without examination to be registered under this Act.

6. Every person registered under this Act shall be entitled to practise as an architect in any part of the colony of Victoria, or, subject to local laws, any other part of Her Majesty's dominions, and to demand and recover in any court of law, with full costs of suit, reasonable charges for professional services, advice and visits, travelling and incidental expenses. (1) In the absence of any agreement as to charges, the schedule of charges published by the Royal Victorian Institute of Architects, as detailed in schedule hereto, to be adopted.

7. After the day of no person shall be entitled to recover any charge in a court of law for professional services as an architect rendered within the limits of the colony of Victoria unless upon the trial he shall prove that he is registered under this Act.

8. Nothing in this Act shall interfere with the right of a duly-qualified engineer to prepare plans for and superintend the erection of such buildings as are essential to any engineering work that may come within the scope of his practice. (1) A duly-qualified engineer for the purposes of this Act shall mean one holding diploma or certificate as a corporate member of the Institute of Civil Engineers (London), or as a water-supply engineer under the Irrigation Act of Victoria, or as a Master of Civil Engineering of the Melbourne University, or other diploma or certificate which in the opinion of the Council is of equal value to any of these.

9. Provided also, that on and after the passing of this Act it shall not be lawful for any public body to appoint any unregistered person as architect or as building surveyor to any such body or institution.

10. On and after the day of the words "legally qualified architect," "duly qualified," or any words purporting a person recognised by law as a practitioner in architecture, when used in any Act of Parliament, shall be construed to mean a person registered under this Act.

11. After the day of no certificate required by any Act now in force, or that may hereafter be passed or that is required by custom from an architect shall be valid unless the person signing the same be registered under this Act.

12. Provision to be made for penalties on unregistered persons practising for fee or reward or using title of architect.

The Act to apply to the whole of the colony of Victoria.

ROMAN REMAINS AT CHESTER.

THE excavations in the north city wall at Chester were temporarily suspended in June. At the beginning of September the work was recommenced at the point of wall where it had been stopped, and Mr. E. F. Benson, of King's College, Cambridge, with a grant from the Craven Fund of the University, came to lend valuable aid. On Monday last the archæologists of Chester met in the Grosvenor Museum to hear and see the results of the six weeks' work set forth by Mr. Benson. The chair was taken by the Duke of Westminster, and the large lecture-room was completely filled. Mr. Benson commenced by exhibiting on a screen magic-lantern slides of the more interesting inscriptions. The principal inscriptions

are six or seven belonging to the *Legio ii. adiutrix pia fidelis*, a legion which appears to have been in Britain under Agricola about the year 80 A.D. Previously only three stones of this legion had been found in our island—two at Lincoln, and one, no doubt of a man on sick leave, at Bath. The new finds suggest that the legion was at Chester, not, as Professor Hübner thought, at Lincoln, and Mr. Benson conjectured that possibly it may have supplied the garrison of Deva while Agricola took the Twentieth Legion northwards, as Tacitus tells us, on his campaign against Calgacus. In any case the Second Legion—not to be confused with the "Legio ii Augusta" of Caerleon—must have been wholly or partly present in Deva about the year A.D. 80, and its memorials are interesting if for no other reason than that we can fix their date. Next in interest were inscriptions of the well-known Twentieth Legion, many of them epigraphically valuable and extremely well preserved, far better on the whole than the stones of the Second Legion. There followed the sculptures and carved stones. Of these the most interesting was one bearing an inscription in memory of a deceased lady, Curatia Di(o)nysia, who died at the age of forty. The tombstone, which is extremely well preserved, represents a lady reclining on a couch at a "funeral banquet," and is a capital instance of this common type of tombstone, derived originally from the worship paid to the deified ancestor, but in Roman hands become a conventional scene. The inscription itself presents some points of interest. The "y" of Di(o)nysia is the Greek upsilon, not a Latin "y," and the omission of the "o" of the second syllable is strange. After this came bits of some frieze. Mr. Benson had, he said, found triglyphs, metopes and a bit of architrave, all in white sandstone, and presumably belonging to one building. Finally, he showed a circular doorhead, which appeared to have belonged to a private house. After exhibiting these slides, the lecturer turned to the opening made near Mr. Dixon's yard in the east wall. Here was found the same Roman masonry, but, so far as examination had been made, no inscriptions, so that the cemetery must have lain, as at Lincoln, on the north side. The date of the wall formed the subject of the rest of the lecture. Competent judges (said Mr. Benson) have put it down to Severus (say 200 A.D.), but a combination of various facts suggested to him something earlier. The Twentieth Legion certainly sent troops to aid in building the Walls of Hadrian and Antoninus. The freshness of some of the stones required but a short period of exposure to the air, and he thought that when the troops sent to assist in the Wall of Antoninus came back they would naturally like an enlargement of the city. This of course was only a hypothesis; it was liable to correction from future discoveries or from better interpretation of known facts, and he only stated it as a view which seemed to him very probable. The cornice on the wall, he added, was Roman, but (as had been suggested in Chester) was perhaps put up when the breaches were repaired in the seventeenth century. Finally, he enlarged on the great aid given to the work by the city surveyor (Mr. I. M. Jones, F.S.I.), who had indicated suitable places to work at, and had been devoted to the operation. The lecture ended with a warm acknowledgment of the kindness of the Duke of Westminster to the excavations.

The Duke of Westminster then briefly proposed a vote of thanks for the excellent lecture, and called on Mr. F. Haverfield. Mr. Haverfield, in seconding the vote of thanks, expressed himself strongly in favour of going on. They were in the midst, probably, of Second Legion stones; they could not leave the riddle half unread. The discoveries were of the greatest importance to scholarship. He had lately visited a Roman fortress on the Danube below Vienna. There he asked who paid for the extensive excavations. He was told that the Emperor of Austria and the rich men and the archæologists of Vienna contributed some 2,000*l.* yearly. Englishmen might be ashamed that they could not do that in England, the home of voluntary work as opposed to State aid.

Mr. Benson, in a letter on the excavations, says:—"I have been in charge of the excavations at Chester for the last five weeks, and during that time we turned up a quantity of tombstones that give rise to a perfectly new factor in the history of the Roman occupation of Chester, and, indeed, of England generally. These tombstones belonged, as the inscriptions showed, to the supplementary 2nd Legion, or, as it appears on the monuments, "Leg. II. ADPF," or "Legio secunda Adjutrix Pia Fidelis." Up to the time that I made this discovery of them at Chester only three had been found in Britain, two at Lincoln and one at Bath. Bath of course was a health resort, and we cannot argue anything from the tombstone found there, except that a soldier of the 2nd Legion went there, but did not apparently get any better under the treatment, so that on the whole the balance of evidence lay in favour of its having been quartered in Lincoln. But during September I found six tombstones at Chester, built up into the north wall, belonging to soldiers of this legion. The legion came to Britain under Vespasian probably about the year A.D. 75, and left Britain for good under Domitian—that is to say, before the end of the first century. It seems, then, beyond a doubt that it was quartered at Chester, as we have already discovered there twice as many records of its presence as are to be found in the rest of Britain put together. Now we know that Agricola took the 20th Legion, whose home was at Chester, into Scotland, where it took part in the wars against Calgacus and other remote monarchs, and it would seem very probable that he left the 2nd to garrison Chester in the absence of the 20th. It would clearly be most ungeneral-like to leave so important a place undefended. He had just concluded a war against the tribes of North Wales. He had attacked British independence in its stronghold at Anglesey, while to the north the Brigantes were ever a turbulent folk, and for commercial reasons it would be highly undesirable to leave Chester without a garrison, for it commanded the valuable lead trade from Flintshire. For these reasons I venture to suggest that the above is the explanation of the presence of this legion where it was so little looked for. These tombstones had in all cases a rounded top, which seems at Chester at least to be peculiar to them; it is certainly not found on monuments of the 20th. This I take to be not so much a specialty of the legion as a mark of date, and I should be glad to know if other evidence confirms this. In other respects also the excavations have been highly successful, among which I may mention the discovery of a piece of distinctly Roman wall on the east side of the town, similar in all points of style to that on the north, and thus tending to show that the two were built at the same time."

TESSERÆ.

A. W. Pugin.

WHETHER as an artist, author, architect or practical assistant in collateral departments, Pugin was alike distinguished. He stood confessedly among the first, if not the very first, of able draughtsmen, scarcely less dexterous in the use of his pen and fertile in imagination and taste, whether designing a complete structure or its minutest accessory. It is not necessary to trace how much of the best detail in the new Houses of Parliament is due to this master-hand, nor the extent of his influence upon those who had the good fortune to work under his directions, many of whom are now evidencing the sagacity which, in the first instance, selected them for the purpose, and the aptitude which trained them for their respective pursuits. Was stained-glass, metal-work, furniture or embroidery required, Pugin could design it, and correctly too. The same with decoration generally; it was a branch of art in which he took delight to revel, and his published "Glossary of Ecclesiastical Ornament" is a mine of wealth. Who has not seen or heard of his churches in London, Birmingham, Nottingham, Cheadle and elsewhere, or the proofs of his versatile genius at Alton Towers, or in his own residences at Salisbury and Ramsgate? Again, many still remember "Pugin's Mediæval Court" in the Exhibition of 1851, though comparatively few persons witnessed his self-denying exertions in collecting and perfecting his materials, ever and anon bustling about with indefatigable enthusiasm to have the right thing in the right place. Pugin was, it is needless to say, a man of ready and quick observation. Quick, too, in committing to the pages of his ever-ready sketch-book such things as met his eye, and which he would treasure in his memory for future use. It mattered little to him whether in mass or detail, colour or form, his pencil or crow-quill could hit off, in perhaps a few strokes, a thoroughly characteristic sketch, embodying all that he desired specially to note. And it is worthy of remark how eminently tutored was his eye and how unerring was his hand in all that relates to perspective drawing. The examination of his original drawings of the more finished kind shows that after the preliminaries of a very few faint pencil lines by way of guidance, and which he often did not care to rub out, he would fill in the most careful and accurate picture with a due regard to the proportion of its parts and an expressive indication of its details truly remarkable. At the same time he could, if so disposed, treat only with the masses of a composition, which he handled with equal artistic power.

Mezzotint Engraving.

The invention of mezzotint is ascribed by Lord Orford and Vertue to Prince Rupert; but Baron Heineken considers that the first idea of it was conceived by Ludwig von Siegen, a lieutenant-colonel in the service of the Landgrave of Hesse. He executed a portrait of the Princess of Hesse, which is dated 1643, seventeen years before the discovery is said to have been made by Prince Rupert. It is further said that Prince Rupert learnt the secret from Von Siegen, and brought it with him into this country as his own, when he came over with Charles II. at the Restoration. Some, again, contend that Rembrandt was the author of it, but Bartsch shows very clearly that he had no claim to it. The tools which are used in this process are, first, an instrument called a *berceau*, or cradle. It consists of a

series of points, like the extreme ends of a small-tooth comb, to which a handle is attached at the top. These are not in a line, but form a portion of a circle, of which the radius is 6 inches; this therefore will be similar to the support of a child's cradle, and when used in an upright position is rocked backwards and forwards on the plate, having the effect of ploughing up the surface; hence its name of cradle. The other tools are scrapers, shading-tools and roulettes. The last-named instruments are similar to the rowel of a spur, and are used to work off any additional part of the surface of the copper. The plate, after being polished in the usual manner, is divided equally by lines of soft chalk parallel to each other, the distance between each line being equal to one-third of the length of the face of the cradle. This instrument is then placed between the two first lines at the top of the plate, and worked backwards and forwards in the same direction. This must be done very steadily, until the operator has completely ploughed up the surface of the plate. He thus goes on from line to line until the whole of the plate has been operated upon. Other lines are then chalked down at right angles to the former ones, and the same treatment of the plate is pursued in the new direction. A third order of lines is then drawn diagonally, and the same process with the cradle is observed. When this operation is completed, the plate is said to have undergone one turn. In order to produce a very dark and uniform ground, the plate must undergo a repetition of this tedious process at least twenty times. Bartsch says that a plate 2 feet long and 8 inches broad requires three weeks to produce a jet-black impression, and a larger plate sometimes more than a month. In other kinds of engraving the artist has a clear burnished surface to work on, and his business is to work up his intended effect by a series of lines arranged according to what he wishes to represent; but in mezzotint engraving the process of producing the picture is perfectly the reverse. Here the operator has a perfectly black surface to work upon, and his object is to arrive at the middle tints and extreme lights by removing more or less of the grained surface of the plate. This is effected with scrapers of different sizes. The strongest lights are taken out first, and many parts, where great clearness is required, are burnished. The different degrees of shading are then introduced, and afterwards the reflected lights. We have few instances now of pure mezzotint being executed. The outline of the subject is almost always laid in with a strong bold etching, which gives greater effect, and relieves that extreme softness which has been complained of in this branch of engraving. Its peculiar advantages, however, consist in the soft gradations of light, so that a good mezzotint print appears as if it were executed with the brush.

Inigo Jones's Sketch-Book.

The sketch-book is a relic of extraordinary value and curiosity, consisting of drawings in pen and ink, with accompanying illustrative remarks and general observations, entirely by the hand of the architect of the Banqueting House at Whitehall; and it affords evidence of the great diligence as well as of the skill and taste of the author. It was made while he was in Italy in the year 1614. The sketches are not only from statues and reliefs, but from pictures by the most celebrated masters of the Italian schools, and the motto chosen by this distinguished man, and prefixed to his sketch-book, supplies an interesting characteristic, showing that at the age of forty-two Inigo Jones thought himself happy only while he was improving his taste, enlarging his mind and laying in fresh stores of science—"Altro diletto che imparar non trovo." Another circumstance connected with this production deserves notice. It is known that Inigo Jones evinced his earliest fondness for the arts in landscape painting, and in the Duke of Devonshire's collection is a rare specimen of his skill in this department. Although Inigo Jones had been appointed architect to the King of Denmark before the year 1606 the sketch-book does not contain a single design, hint or note, of or for any building, public or private; while it is obvious from every page that the author was studying the human figure with great care and delineating the features of the human face in minute detail. Hence it would seem that in 1614 he was devoting his attention very much to painting and sculpture, as if anxious to supply deficiencies of which he was aware, and as if this, his second visit to the Continent, had been undertaken chiefly with that purpose. It will be seen that nothing was too great for his ambition, nothing too insignificant for his observation, from the *Last Judgment* of Michel Angelo to the simplest folds of drapery. The sketch-book of Inigo Jones also serves to clear up a point in his biography, of the more importance because it has relation to his quarrel with Ben Jonson. On the first page it bears the date of "Rome, 1614," which at once settles the question disputed by Mr. Gifford and Mr. A. Chalmers, whether the disagreement between Inigo Jones and Ben Jonson "commenced in 1614." Of course it could not "commence" while Inigo Jones was in Italy, and the hostility certainly did not break out until a much later period, viz. Christmas 1631–32. Inigo Jones at that date took offence that Ben Jonson had omitted his name on the title-page of the masque of "Chloridia," on the preparations and scenery for which Inigo Jones had been engaged. This circumstance establishes that Ben Jonson had no reference to Inigo Jones in his "Bartholomew Fair," acted in 1614, the very year when Inigo Jones was in Italy, while it tends to fix upon him the ridicule contained in "The Tale of a Tub," which was performed in 1633. The precise date when Inigo Jones returned to England has not been ascertained, but his departure has been erroneously stated to have taken place in 1612. It appears by a Privy Seal that Inigo Jones was engaged in January 1612–13 in making arrangements for a masque at Court. He probably left this country soon afterwards. The sketch-book is only a very small part of the valuable remains connected with the life and reputation of Inigo Jones transmitted to the Duke of Devonshire by the celebrated Earl of Burlington. Inigo Jones, with some interruptions in consequence of absence from England, superintended most of the Court entertainments from the accession of James I. to the commencement of the Civil Wars, and at Devonshire House are preserved the original designs, not only of the scenes but of the characters, for the masques at the different royal residences. The details of all the fantastic habiliments are given with the utmost minuteness, both as to form and colour, and the sketches for large views of rocks, waterfalls, woods, palaces or temples illustrate most remarkably the contrivances for the representation of those splendid shows which were the peculiar delight of our first Stuart and of his unfortunate successor.

Decadence of Ancient Art.

The state of artistic design was undoubtedly at its lowest when basilicas began to be erected as churches. The old Greek sense of beauty had died out in Rome. Luxury and vulgarity had gradually destroyed the manliness of the race, and such sense and love of beauty as it had possessed in days of vigour and prosperity. Constantine could find few competent artists either to sculpture his triumphal arch or to decorate his new capital. Still the Christian community had carried down with it into its subterranean oratories and chapels certain traditions of former times. Historical representations, even sometimes under mythological types, as that of Orpheus, are habitual to those interesting monuments. The classic, and occasionally the nude figure, continued to be represented in their paintings. As basilica building and decoration progressed, a marked difference is to be found between the simplicity of accessories of dress and ornament in the west, in contrast with the elaboration of colour and detail in the east. The basilicas of Justinian at Ravenna are interesting examples of this Byzantine spirit. They represent in more than one instance the emperor and his court, or his empress and her court, with details of costume carefully followed. But though these designs were rude, and showed ignorance of form, they were by no means wanting in grandeur. Quite the contrary. That nerve and vigour of character which luxury had eaten out of the Italian character was beginning to grow anew from fresh sources, and Christianity really inaugurated the revival of the arts. That revival was slow, and conducted through most stormy ages of calamity, but a genuine revival it was.

Romanesque Windows.

In all periods of Romanesque we find occasionally two or more arched openings comprised under one enclosing arch. This arrangement is more frequent in belfry windows and triforium openings than elsewhere, but occurs in ordinary windows, especially in secular buildings. The space intervening between the large arch and the two or more placed below it was, even as early as this, occasionally pierced with circles or other forms of opening. Here, then, we have the elements of the mullioned window before even the introduction of the pointed arch. In the same situations it gradually developed itself, step by step, during the Early Pointed period, so that we have in triforium arcades and in other positions a pretty full development of what is called plate tracery, before its use became frequent for ordinary windows. The case was pretty much the same both in France and England, though, on the whole, the love of placing two openings under one arch was greater in France; thus we see in the aisles at Chartres two plain lights under one arch, with a circular opening, and above, in the clerestory, a very large circle with somewhat complex subordinate piercings. The same is the case at Bourges, where three lights are often comprised under one arch, with a single circle in the head. The next great element which aided in producing tracery windows was the wheel, or other richly-pierced circular window. This, again, originated under the Romanesque style, as we may see at Barfreston and elsewhere. It is, in fact, a very close approach to tracery, and when placed in the space between comprising and comprised arches, it almost completes the change. All that is wanted is the piercing of the intervening spaces in forms whose outlines are parallel to the main piercings, so as to form what Professor Willis calls bar tracery.

NOTES AND COMMENTS.

The first meeting of the session of the Birmingham Architectural Association was held on Tuesday last, when Mr. W. Hale delivered his presidential address. He asked the members to consider that there was but one true meaning of the term architecture, and that the practice of architecture was an art resting on a scientific basis, and not a mere business. He pointed out that a building might be well or ill planned, and soundly constructed, and yet be devoid of architecture; but that it was essentially a part of good architecture that the building should be well planned and built. Mr. Hale then urged that good architecture could not be obtained by mere antiquarianism, and that the study of old work should be made with the view of adapting the principles which produced good results to the needs of modern times. This could not be done by mere following of precedent, but good results could only be obtained by basing the artistic elements of architecture on the scientific laws which should govern the planning and construction of modern buildings. In looking to the future, Mr. Hale thought that there was much reason to hope for better things, for though architecture could not be considered level with the times, the work of to-day was greatly better than that of thirty years ago, and the junior members of the profession were enthusiastic, and had greater opportunities than their predecessors; though, on the other hand, he felt that the general public understood nothing of architecture, and he would like to see some education in the elements of it given in schools. Mr. Hale also spoke in favour of a suggestion which had been made that an artist architect should be appointed by city authorities to approve the designs of new buildings.

The people of Exeter are not remarkable for intelligence, but a jury of the citizens has been competent to deal with a claim for 60*l.* 16*s.* by an architect which was sued for at the City Quarter Sessions on Monday. The circumstances were characteristic of the odd way of doing business which prevails in Exeter. A firm of stationers and printers in May 1890 instructed Mr. A. H. Wills, an architect, to prepare plans for an extension of their premises. The commission was executed, and, in addition, a picture of the shop in its future state was drawn. Subsequently a specification was prepared, quantities were taken out, but tenders could not be obtained as there was a strike in the building trade. After a time, however, tenders were sent in. The lowest was 748*l.* The sum was considered too high, and the work was reduced until it could be done for 595*l.* In Exeter there is parsimony, and, in the hope of effecting a further reduction, the plans were again altered. Work to the value of 60*l.* was set aside, and the architect was compelled to decline the responsibility for the consequences, as the building would not be able to stand the strain of the printing machines. As further cutting-down was impossible, the head of the firm proposed to wait until a nephew reached manhood! The architect sent in his account, and, as it was not paid, he was compelled to take an action. Of course there could be no valid defence, and the defendant shuffled in his evidence in a way that was remarkable even for Exeter. The large sum of 1*l.* 5*s.* had been paid into court, and the jury brought in a verdict for an additional sum of 43*l.* 15*s.* Why the whole sum claimed was not awarded is not plain.

The Parthenon was not the first temple dedicated to Athené that stood on the Acropolis. Previously there were two temples under the protection of the goddess, the larger being known as the Hecatompedon. It was generally assumed that the Parthenon was built on the site of the larger building. This belief was expressed in the quotation from Landor that was printed lately, in which Aspasia is made to say, "The Hecatompedon, which many of the citizens begin to call the Parthenon, is now completed, and waits but for the goddess." The Germans, on the other hand, contend that the smaller and older of the two temples was the Hecatompedon. A paper on the subject was read by Mr. F. C. Penrose at the meeting of the Hellenic Society on Tuesday. On the strength of carefully-worked-out architectural evidence Mr. Penrose explained that the earlier temple occupied the same site as the later Parthenon, and that to it, and not, as Dr. Dörpfeld maintains, to the archaic temple which stood between the Parthenon and the Erechtheum, belonged the drums and other architectural fragments which have been built into the north wall of the Acropolis. Mr. Penrose further thought it probable that the very remarkable groups of archaic sculpture which were found on the Acropolis a few years ago had occupied the pediments of the Hecatompedon. Judging by the practice among Christians during many centuries, which seems to be in accordance with common feelings, the site of the Hecatompedon would be considered as sacred and the most suitable for the new temple. But there is no doubt Dr. Dörpfeld's theory has found much favour with archæologists. It has been adopted by Professor Maxime Collignon, of Paris, who was not likely to be biassed by anything coming from a German source. He says:—"It is generally supposed that the present Parthenon was built upon the site of the ancient Parthenon that was burnt by the Persians; but if so we must believe that the Athenians allowed the ruins to remain for the period between the Persian war and the reconstruction. The results of the recent explorations have furnished the solution of the problem. We must recognise the ancient Temple of Athené in an edifice of which a part is mixed with the substructure of the Erechtheum. That was the temple constructed of stones from the Piræus, and which was destroyed by the Persians. When Cimon constructed the south wall of the Acropolis, he began the construction of a new Parthenon on the site of the actual building, but the works were interrupted through his exile, and there seems to be no doubt that the drums of Pentelic marble that were found built in the north wall of the Acropolis formed part of his building. Pericles, in his turn, commenced and completed the building that still exists." The subject is one that is well adapted for controversy. Mr. Penrose is not the originator of the theory that the Hecatompedon and Parthenon are on the same site. It is an old one in English classical schools. But he has set up evidence in its support of a kind that was not attainable by scholars.

The parish church of Stratford-on-Avon has been made so familiar to American eyes by means of engravings and photographs, it is no wonder some visitors are dissatisfied when they behold the building in its transformed state. A Mr. Winter supplies the *New York Tribune* with the following account of his emotions on a visit to the church:—"I went into the chancel a few evenings since, and stood there alone in front of the altar and looked around, and I was amazed and grieved by what I saw. The aspect of that chancel is no longer ancient, but quite new. The altar has been moved from its place against the eastern wall, beneath the great window, and has been elevated upon a double pedestal. The floor of the chancel round about it has been paved with encaustic tiles of hideous brown and yellow. Almost all the mural tablets upon the north and south walls have been taken down and carried away, and they may now be found dispersed in the transepts; while their place is to be filled with a broad expanse of new wooden panels, extending from the back of the *miserere* stalls upward to the sills of the windows. The stalls themselves have been repaired, but this was necessary, because the wooden foundations of them had become much decayed. And, finally, the stone screens that filled up the window back of Shakespeare's monument and the window back of the monument of Judith Combe and her lover have been removed. The resultant effect—which would be excellent in a modern hotel, but which is detestable here—is the effect of enterprise, action and novelty. The pervading air now is that of the new broom and 'all the modern improvements.' Those improvements, no doubt, are very fine; but if ever there was a place on earth where they are inappropriate and offensive, that place is the Shakespeare Church." The clergy and the good people who paid for the renovation have reason to be dissatisfied with Mr. Winter, for it was no doubt with the intention of gratifying Americans that such sweeping alterations were undertaken. For who else was the church made spick and span as a modern hotel? Yet Mr. Winter says that "all that was asked was that it should be left alone." Such is Western gratitude for making the building worthy of the youngest city.

THIS building is now in course of erection, and stands in one of the best positions in the town, opposite the Municipal Offices. The ground floor is faced with Portland stone, and the upper storeys with Bracknell sand-brick rubbers. The large office of the company, with the board, secretary's, waiting and strong rooms, occupy the ground floor, and the upper floors are arranged in suites of offices. The architects are Messrs. GODDARD, PAGET & GODDARD, M.R.I.B.A., of Leicester, and Mr. J. O. JEWSBURY, of the same town, is the contractor. The drawing that has been reproduced was exhibited this year in the Royal Academy.

THE ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the session was held on Friday evening, Mr. F. T. Baggallay, president, in the chair.

Messrs. R. A. Jack, W. G. Watkins and P. J. Hanson were elected members. The list of names nominated for election as members amounted to fifty-three. Various donations in aid of the new scheme of education and donations to the library were announced, a special vote of thanks being awarded to the donors.

The PRESIDENT stated that Mr. F. R. Farrow had been appointed lecturer in connection with the new curriculum, and consequently, in accordance with their rules, had sent in his resignation as Vice-President.

The PRESIDENT then distributed the prizes, after which he delivered the annual address as follows :—

The President's Address.

It is probable that never since the constitution of this society, forty-four years ago, has the president for the time being risen to deliver his address at the opening meeting under a heavier sense of responsibility than that which I feel at this time. We stand together as an Association at the threshold of a new life; we have taken upon ourselves, as a body, grave responsibilities, fraught, in all probability, with good or ill consequences of the most serious kind, not to ourselves alone, but to the profession and ancient art of architecture. At such a time you have a right to expect from him upon whom you have conferred the highest honour at your disposal, by placing him for a time at your head, that he shall well weigh the words which it is one of his duties to utter. At first sight, the most obvious course to take at a fresh point of departure, such as the present certainly is, would be to recite the main facts of the history of the Architectural Association, and especially of the history of the past two years, during which the changes now brought about have been discussed and decided on. I am, however, afraid of wearying you by any such recital, and, moreover, it might be difficult to avoid all controversial matter such as you are probably as desirous as I am should be left alone. The main facts and considerations which, in my opinion, have been accumulating for many years, and have gradually impressed upon most of us the great necessity for a radical reform in the method of conducting our classes, were fully stated and commented on in a paper read before the Royal Institute of British Architects last July. This paper was issued to all of you as a supplement to the August number of "A.A. Notes," and I do not, therefore, think those facts and considerations need be again referred to here.

It is, however, necessary to state what changes have been made, and some of the main objects aimed at in them. This I will do as shortly and concisely as possible, premising that all that has been done is based upon the resolutions relating to the matter which were passed by the Association in June 1890. The four principal objects or central ideas have been—first, to substitute a series of classes arranged on a comprehensive system, for the old classes all independent of one another, with a view to conducting students through a regular course; secondly, to substitute a single responsible teacher or lecturer in most cases for a group of voluntary instructors, with a view to making the instruction more consistent, consecutive and effective; thirdly, to fill up gaps and make the course complete; and fourthly, to provide a place in which students could make their drawings and designs under the superintendence of competent instructors, with the advantage of their advice while at work, instead of only hearing their criticisms when it was completed. With these objects in view, a regular curriculum of study has been drawn up, the details of which are all fully set out in our Brown Books, and in the pamphlet which has been sent to you all, and for the editing and circulating of which we are indebted to our enthusiastic honorary secretary, Mr. E. S. Gale. To conduct the work of the various classes, lecturers and instructors have been appointed, whose names will be found in the Brown Book, and are a guarantee that their work will be well done. It is almost unnecessary to add that in many cases the task has been undertaken out of pure goodwill to the Association, or to the cause of architectural education. To provide the accommodation for drawing and designing, and also to provide proper classrooms, new premises at No. 56 Great Marlborough Street have been rented, where a library and reading-room and office, two classrooms and two studios have been fitted up. You are already aware that the increase in the secretarial work of the Association involved by these fresh arrangements, added to the already heavy burdens laid upon our honorary secretaries, has necessitated the appointment of an assistant secretary at a salary.

The fees to be paid by students have been fixed in accordance with the resolution dealing with that matter. They are, of course, large as compared with the old nominal class fees; but from all other points of view I think they must be acknowledged to be exceedingly moderate. At the same time it is calculated that, under the arrangements made, all expenses for instruction and the increase in rent and other expenses involved by the change, will be paid by these fees if twenty-five fresh members take up the course each year and pass steadily through the four years, or if there is an equivalent attendance in other ways. These arrangements, although they leave many important branches of our work untouched, a circumstance which has, I fancy, sometimes been overlooked, certainly represent something like a revolution in our system of education, which has always been and must, I think, always remain our chief object. The change may seem to many to have come somewhat suddenly; but those who have watched closely the position and work of the Association and the advance of architectural education in recent years, cannot but have observed the gradual approach of the time when some such change would be absolutely necessary, unless, indeed, we should be satisfied to sink into insignificance or become a mere social body. Not only had our classes become too numerous and some of them too unwieldy to be managed in the old way, but the technical training of architects had become too serious a matter to be undertaken in other than a serious spirit and systematic manner. A change of some sort has been foreshadowed, more or less, by almost every succeeding President, in the annual addresses of the last seven years, and the nature of the change has, as you know, cost us during more than two years much discussion and much thought and labour. It has now been effected with the sanction of the general body of members, and, whether for good or ill, we are launched upon a course which most of us believe is destined to lead the Association into a position of influence and usefulness very far in advance of even that that it has hitherto occupied, but which, it cannot be denied, may prove at the outset one of some danger and difficulty.

It is not easy for me to indicate precisely where the danger or difficulty may appear, nor do I wish to anticipate anything of the sort; but when we think of how small a reserve of funds —notwithstanding the generosity of our friends—the Association has to fall back upon, it is impossible to feel that we are safe in that direction. Then, again, it would be strange if all the arrangements for the future, made, it is true, with an immense amount of labour and anxious care, but still under some pressure of time and necessity, and without the data which experience alone will provide, were found to be faultless, or to work in every respect perfectly satisfactorily. We must, I think, expect as time passes to find that many improvements are possible, and will have to be introduced. Again, it would be almost as strange if such changes as have been effected had been brought about entirely without injury to some individual interests. Any considerable change or reform in such an old-established society as ours must, I imagine, almost inevitably at the moment produce a small crop of grievances. I hope it may not prove to be the case in the present instance—and at least we may be sure that *esprit de corps* will prevent anyone making more of his grievances than he can help; but that makes it all the more incumbent on us not to shirk the difficulty, but to be prepared earnestly to endeavour to mitigate any hardship inflicted upon individuals, if we can do so without injury to the interests of the Association as a body. It will usually fall to the lot of the committee that you elected last May to deal in the first instance with any difficulties which may arise. That committee has laboured almost incessantly for the last

four months, and will so continue to labour, in the interests of the Association, and for the promotion of its objects. It is unusually representative of a large number of interests and shades of opinion in the Society, and I am sure that it has the confidence of the general body of members, and will receive their support in the future as in the past.

To return to our new curriculum. The fact that the course extends over four years has been much criticised, some being of opinion that it is too long a period, and some that it is too short; but I think if you consider that among those who use our classes are not only pupils in all stages of their articles, but also assistants and others of some years' experience in the profession, and that it would be neither just nor expedient if we omitted to provide, as far as possible, for the wants of all of these; when, too, you remember that those who intend to become members of the Institute must in future, according to the regulations, allow four years to elapse between their preliminary and final examinations, then I think you will come to the conclusion that there are sufficient grounds for the arrangement that has been made. We cannot, of course, expect that all who take up the course in the first or any year will go through all the subsequent years—loss of enthusiasm, pure idleness and circumstances of various kinds will cause many to fall out, and the gaps cannot all be filled by those who come up from the country or from abroad to finish their professional education or by the occasional students who prefer to pick out only certain classes. We must, therefore, be prepared always to find a rather larger number of students working in the earlier years than in the later ones, just as hitherto our elementary classes have always been the better attended. If, however, the classes are properly and efficiently conducted, as it must be our business to see that they are, we may fairly expect that a considerable number, probably a large majority, of future members will see the advantage of working steadily through the four years' course, for, even if the opportunity of gaining an insight into all the subjects taken up were not sufficient inducement, the spur of the Institute examinations might be trusted to keep many at work.

It is still impossible to judge of the extent to which the new classes will be popular, but the number of students who have taken up the course, or parts of it, already is quite as large as, if not larger than, one could reasonably have expected to begin with, and the number increases every day. One very promising circumstance is that by far the largest number have entered as "first-year" students. If most of these gentlemen work steadily through the four years' course, and if about the same number enter each October, there can be no doubt whatever that in the estimated three years' time, or even sooner, the full number expected will be reached. Judging by the attendances up to the present time, the studio, contrary to the expectation of many, appears to be a very popular part of the new arrangements. Another most encouraging circumstance, and one deserving to be especially mentioned, is that, in a considerable number of cases, the fees appear to be paid by the principals for their pupils. In this connection it is worth while to mention that a fuller comprehension of our intentions and arrangements seems to have led to an approval of them which is not only much more general among architects than at one time seemed likely, but which appears to be now very nearly universal. Several of those who at first certainly viewed the proposed changes with suspicion, if not with dislike, have now expressed an approval more or less cordial, and one or two have subscribed to our funds or promised help in other ways. Perhaps the greatest encouragement we have received is from the fact that the Royal Institute of British Architects so far thinks well of what we are doing, that it has in the most friendly spirit passed a resolution pledging itself to afford us pecuniary assistance, and instructing its Council to consider and decide as speedily as possible in what manner and to what extent such assistance shall be given. I do not know at present what decision will be arrived at, but we have every reason to believe that the donation or subscription will be a generous one.

The premises, which after much trouble and delay we have been so fortunate as to secure, though a little small, are in all other respects admirably suited to our purposes. We only obtained possession about a fortnight before the opening of the session, and, notwithstanding every effort on our part, they were still far from ready when first used; they are now, however, in fairly good order. It will still, naturally, take a little time before we completely settle down into them: but when we have done so, I believe they will prove to be very convenient and well adapted to the uses to which we are putting them.

Funds are still much needed to meet the heavy initial expenses and the deficit on account of the classes which there must be this year, and which there will probably be for one or two years to come. Notwithstanding the generous donations we have received, the 2,000*l.* we asked for has not yet been half subscribed, and I do not think we can rest content without the full amount. A much larger sum which could be treated as capital or as reserve is, indeed, needed before the Association can consider itself in a perfectly secure and satisfactory financial position. But pressing as the financial question is, it is not so pressing that it should exclude from our minds the grave responsibility we have assumed towards those who will entrust their technical training to us, and, indeed, towards the whole of the architectural profession. I put the matter thus, because, although we have from the first held classes, and have for some years given lectures, and done a good deal of serious teaching, we have never before professed to do the greater part of it in other than a semi-amateur way, and have never pretended that the Association course was anything like a full or sufficient complement to the practical training of office work. We may say that we make no such pretension now, and shall be right in so far that private study, especially in certain directions which I propose presently to indicate, will be as necessary as ever; but as regards such technical training as lectures and classes can give, I am afraid students and the profession will now have a right to expect our course to be complete and efficient.

I think we cannot justly refuse to accept this responsibility, or to strive earnestly to fulfil the duties of the position we have assumed, by making our teaching as complete and as efficient as the most strenuous efforts and most watchful care on our part can make it. Among the duties which it is possible for a professional society to charge itself with, I can imagine none more useful or more honourable than this training of its younger members for the practice of their art, and if we are true and faithful in discharging this duty, we shall deserve the gratitude and should have the support of the whole of the architectural profession in this country. Architectural education has been the subject of much that has been said and written in recent years, and considering the many-sided character of an architect's work, and that it is quite impossible for any mere man to have all the skill and knowledge which a theoretically perfect architect would have, it is not very surprising that there are almost as many opinions as there are writers and speakers. Some hold that pupilage is all-sufficient; some that it ought to be done away with; some put their faith in sketching and measuring up what our forefathers built; others say that a modern workshop is the proper school for us; some would have the German school system, others the French atelier system; and there are plausible, indeed very good and sound arguments which can be, and have been, urged in favour of each of these theories in turn. Yet, anxious as we all are for the improvement of architectural education, I do not think these theories need trouble our minds very much, or cause us to hesitate in what we are doing, even if it does not fall in exactly with any of them. The fact that apprenticeship has an immensely strong hold upon the profession, and that, notwithstanding its many abuses, it is on the whole a good system, with many advantages, makes all talk of superseding it useless for the present, even if it were possible to prove that what we should substitute would be less open to objection. At the same time, all that we have been doing for the last forty years, and all that others have been doing recently, proves beyond a doubt that apprenticeship is not, as regards architecture, so all-sufficing in the latter half of the nineteenth century as it once was, and that there is a real and urgent call for something in addition. On this ground the Association has always taken its stand, and does so still. We aim no blow at pupilage, but we desire to provide means whereby the necessary knowledge and training, not to be obtained in the course of office work, may be accessible to those who join us. Among these means, classes and lectures, and our newly instituted drawing and designing school or studio, are not the only ones, although they are perhaps the most important. It must not be forgotten that we have a library which is, I believe, the largest and the most nearly complete architectural lending library in the kingdom. Our books are also accessible to members for reference when not out on loan, and a recent munificent donation will enable us to largely increase the number available for this purpose. I cannot too strongly urge upon you all to make all possible use of these books. Whether it is that the use of the pencil has such superior attractions, or whether it is an exaggerated notion of the comparative uselessness of mere "book-learning," I know not, but too many students of architecture, I am afraid, read but little, and that little probably only when it is needed to enable them to pass some examination. This is a great mistake; even if there were nothing to be learnt from books which might not be better learnt in some other way—which is far from being the case—still, reading exercises the brain and stimulates thought and imagination in connection with a subject. Even desultory reading is of use in this way; but the systematic study of the literature of a particular subject is obviously infinitely better.

Another of the most useful of our institutions is our system of visiting works in progress. These are usually among the most important buildings being erected in London at the time, and the opportunity of seeing for yourselves how they are being put together and what their architects consider to be the best ways of doing certain things, the best methods of construction and the best means of heating, ventilating, lighting, draining,

and so on, is an advantage which can hardly be estimated too highly. Our visits to old buildings, especially when they are buildings not otherwise readily accessible, are no less useful and are even more attractive. The annual excursion of a party to some district of architectural interest in England or abroad is as enjoyable as it is improving to those who take part in it, and I am surprised that the number of excursionists does not increase; the expense is really very small, and would be less if more joined, but notwithstanding the immense increase in the muster-roll of the Association, this number remains always about the same as it has been for many years past. It may encourage some of you to know that several comparatively younger members came with us this year, and I am bound to say that among them were some of the best sketchers, and that, as far as I could see, they enjoyed themselves and did as much work as the old hands. Whether or no the proposal to organise a junior excursion, which fell through last year, will be revived I cannot tell—I believe that by some it is not thought desirable; but for my own part I fancy good might certainly result if some of the junior members could agree to spend a few days together in studying some work of interest at a distance from London, provided, of course, that the scheme were properly thought out and carefully organised.

Another circumstance which has often surprised me is that the Sketch-book published by the Association does not share, as it should, in the general progress by attracting a larger number of subscribers; the value of the plates as records of old work, owing to their size and to the large number of drawings and sketches from which the subjects are selected, and owing to the care exercised in their selection and reproduction, is out of all proportion to the cost and would seem to deserve more recognition. Recently Mr. Lewis, one of the editors, has expended a great amount of time and labour in collecting and attaching to the plates a variety of authentic information, especially dates, which should further recommend the publication to you. One of the humbler, but not the least useful, of our institutions is our register of assistants who want work. It is an institution through which, I believe, many principals and assistants have been brought together to their mutual benefit and satisfaction.

Above and beyond all other means by which we strive to carry out our objects, our fortnightly ordinary meetings are the most ancient, and still one of the most important. I could wish to see these meetings better attended than they have been sometimes lately. I should like to hear the discussions more lively, and the chat in the room after the meeting more general. The papers which we are promised this year ought, from their titles and the names of their authors, to be at least as interesting and instructive as any we have ever had, and I venture to express a very strong hope that both senior and junior members will make an effort to come as often as they can and to contribute as often as they can to the discussions, by giving us their opinions or by relating what they know on the subject, or by suggesting points on which the lecturer might give fuller information. I remember that in past times a good many questions used to be asked of the lecturer by the younger members, and I hope the custom will be revived; it is an easy way in which to join in the discussion, and may often be exceedingly useful in eliciting information. I hope, too, to see the old custom revived of exhibiting some of the class work—it will now be the studio work—in the room on these occasions. I think, with a very small effort on the part of individuals, our ordinary meetings might be made the means of drawing us all more closely together—we should at least get to know each other's faces better—and really good discussions on the subjects of the papers could not but be of the utmost benefit to all.

To return to our classes. It may seem full early to think of another step forward, and it is not with any hope that it will be possible to undertake anything more for some time to come that I venture to make a suggestion, but only that it may be borne in mind if ever opportunity should allow of its being acted on. The step I refer to is the addition of a little workshop practice to our curriculum. I have mentioned before the theory that an architect's training should be mainly in the workshop, or, as those who have recently advocated the system put it, that the architect should be trained as a craftsman rather than as a professional man. This view is no new one, but the support which it is just now receiving in some quarters is exceptionally strong, and, because we do not at once accept it, one or two gentlemen have declared, if I do not misunderstand them, that they will have nothing to do with us. There can be no doubt whatever that those who are so enthusiastic in this matter have this much right on their side, that it is of the greatest consequence that an architect, among other acquirements, should have a thorough knowledge of his materials, and of how they are or can be dealt with; but I think a great mistake is made when it is supposed that this necessary knowledge can only be acquired by bringing up an architect mainly as a craftsman himself. I fancy I see, too in such a system a great danger of narrowing the thoughts and ambitions of our students, and of further exaggerating the faults which are already too apparent in our architecture—I mean the sacrifice of breadth and largeness of conception to mere littlenesses and prettynesses. The attention which we have for the last fifty years given to detail, first to mouldings, then to decoration, then to furniture and wall-papers, and fittings and pretty bits of all sorts, have made many architects among us equal, if not superior, to the architects of any other age in these matters. Those, and they are many, who have such skill are in the right in being proud of it; but we must not act, or even talk, as if skill in designing a sideboard or a wall-paper, a finial or a window-fastening, were the chief thing to be aimed at in an architect's training. An architect's first thought, his best work, must be given to his building as a whole; he must learn to grasp all the larger artistic and other problems presented by it, and deal with them in a large and comprehensive way, treating details as incidents, with all the care that their importance in the design entitles them to, but on no account giving them the first thought or greatest consideration.

I have been led into a digression by the suggestion which occurred to me that some day we ought to give our students the opportunity of a little workshop practice, say at least in joinery and metalwork, not with any idea of making them skilled mechanics, but to show them, in the most practical way, how wood and various metals can be dealt with. At present, we have no time, no accommodation and no money for this branch, but if some day we can appropriate two or three hours a week in the afternoons to our classes, and if money can be found, I think we should do well to remember the workshops. As regards day classes, the claims of which were rather strongly urged at one time, they have not been forgotten, but the practical difficulties in the way, and especially the expectation that the evening classes alone would at first tax all our powers of organisation and management, have led to their omission from our present programme. Meanwhile the studio, as a beginning, is to be open all day, and some few students have already intimated their intention to use it, either every day, or on certain days in the week.

Besides the financial help already promised, there are two ways in which I think that the Institute might possibly be able to assist us very materially at the present moment, to make our new classes useful and popular, if they were asked to do so. The first is this. You will notice that, although the Institute examinations are held in March and November, our course finishes at the end of May; this we cannot very well help; we can neither very well begin our work two months earlier, nor can we get it into six months instead of eight. I do not know if there is any especial reason for holding the examinations in the months named, but if there is not, or if any difficulty in the way of a change could be overcome, it would obviously be a great advantage if the date of one or both examinations could be altered so that one should fall in June, after the conclusion of our course. I have heard already of cases in which students preparing for the examinations have felt unable to join our classes because their studies would not be finished by March, and they cannot afford to be kept waiting for five or six months. The other way in which the Institute could help us would be by a declaration that, up to and including the first qualifying examination for the Associateship after the end of May 1893, candidates for that examination would not be required to have passed the intermediate examination. I believe, from what I have heard, that students who have not yet passed the intermediate examination have been, up to the present, deterred from taking our third year course by the fear that the qualifying examination would be closed against them before the end of their two years' study with us. I think we should do well to approach the Institute with a view to finding out if these two matters could be arranged as I have suggested.

I would ask our new lecturers and instructors and students to remember that they are in a sense pioneers, that their zeal, their industry, and their conduct will form precedents for the zeal, the industry and the conduct of their successors, and on their success or failure in achieving what they attempt will in no small degree depend the success or failure of the Architectural Association in the future. I beseech them to bear this in mind throughout the year, and to let it act as an additional spur to their exertions.

I believe I should fail in my duty to those of you who are on the threshold of the architectural profession if I failed to repeat the warning so often given on these occasions by asking each of you to consider well before you go too far, and to turn back, if necessary, before it is too late. I can scarcely hope in the time at my disposal to prove it to you, but you must take my word for the fact that with most men architecture as a profession has far more attraction for the romantic ambitions of youth than for the soberer sense of middle age; I ask you to remember this, and to make allowances to yourselves for it before you finally decide upon going forward. If you have the artist's love for art or his pride in the creations of his own imagination, and, to gratify this feeling, are satisfied to lead a life of self-denial, and of incessant labour and worry and frequent disappointment, you will, if you are moderately successful, find the life of an architect not bearable, but happy. But if you wish

for fortune or public fame, believe me, you can win neither among us. If you are determined to go forward remember the saying of the Hebrew King, "Whatsoever thy hand findeth to do, do it with thy might." If you will be an architect make up your mind, both for your own sake and for the sake of architecture, to be a good one. Do not trouble yourself with unnecessary conundrums as to whether architecture is an art or a profession; do not dub yourself either an "artistic man" or a "practical man," but be satisfied to be merely an architect, armed at all points, able to devise a building beautiful to the eye and adapted in all ways to the purpose for which it is required, and equally able to get that building erected with the materials and workmanship best adapted to the circumstances of the case, and without its costing more or taking longer to build than it should do. Before you can do all this you have years of hard study before you. You have your eye, your mind, and even your hand to train. You have a number of facts to assimilate, and probably certain habits to form, without which you would almost certainly get into difficulties that would overwhelm you. I do not tell you this to discourage you, but only to show you the necessity for constant application.

Begin by devoting a considerable amount of your time to learning to draw well and rapidly, not only with the aid of a drawing-board and T-square, but also, and perhaps especially, without any other aid than a piece of paper and a pencil. Drawing is more necessary to an architect than Latin is to a lawyer; it is the language in which he can most readily express his ideas and record his impressions, and until you have obtained the mastery of your pencil you will find several of the most delightful and useful avenues of study closed to you. At the same time do not forget that for you drawing is only a means to an end, and not the end itself. Do not let the pleasure you will find in the use of your pencil lead you to be satisfied to spend your time in making pretty drawings merely for their own sake, or you will, instead of becoming an architect, be in danger of becoming a mere draughtsman. Meanwhile, cultivate your sense of the beautiful by as frequent a contemplation of beautiful objects, especially architectural objects, as you can compass; do not neglect pictures or natural scenery, or indeed anything which moves you to admiration; stimulate your eyes to carefully observe and your mind to analyse these objects, in order if possible to ascertain the source of their charms. Strive to stimulate your inventive faculties and your powers of reflection and original thought by setting yourself problems, and endeavouring earnestly to find the true solutions of them.

Do not neglect to store your mind with all facts which may be of use to you. The object of our lectures and classes is to give you the most important of these facts in a form as concise, and as easily understood and remembered as possible, but there is much that with the best will they cannot give you. Here again your powers of observation, of analysis, and of reflection must be brought into play; visit buildings in progress and workshops whenever you can, watch the men, examine the materials, question the foreman, ascertain the usual way of doing certain things, and if possible why they are so done, and take all opportunities of comparing the drawings and the specification of a building with the work on the spot, in order that you may the better understand the connection between the actual work and the representation and description of it. Make yourself acquainted, too, as far as you can with all the business of the office in which you are engaged, and with the manner of conducting it. Finally, do not fail to test your progress, if only for your own satisfaction, by means of the Institute examinations. If you do all this you will in a few years become a competent architect's assistant; and if you persevere in the same course for a few years more, you may then venture to undertake any little work on your own account with which you can get anyone to entrust you; but do not be in a hurry to accept any such responsibility, that is, do not try to practice for yourself too soon; I believe that many a man has ruined his prospects by this fatal step. It is so pleasant to be your own master, and to be an architect instead of a mere assistant; but it is, at the same time, so easy to fail for lack of experience, and to get a character for incompetence which it may take years to get over, if it does not affect your whole career.

While striving to perfect yourself as an architect, do not, as you value your peace of mind, your reputation and even your success, neglect your character as a man; cultivate courage and energy, perseverance and patience, and keep in mind the oft-quoted advice of the late Professor Cockerell to be "an artist among gentlemen, and a gentleman among artists." Strive to be as honest and true in your inmost thoughts as you are in your dealings with others; shun all affectation of opinion as you shun affectation of manner; shun, too, that vanity and the pharisaic spirit too common among us, which leads a man to think himself the superior of others who happen to be of a different profession or to hold different opinions. Be forbearing and courteous in all your dealings with the world, and never believe ill of others if you can help it.

In conclusion, cultivate that spirit of fellowship with your colleagues and fellow-students which it is one of the chief aims of this Association to foster; do not neglect the opportunities it affords you for forming friendships with some of the nearly 1,200 members who compose it, and, if possible, make the Association your creditor by taking some part in the good work which it is doing, and will, I hope, continue to do in the future. If you would reap the full benefit of your membership, identify yourself with our work, and be ready to exercise a little self-denial for the general good. This is the spirit which has animated the Architectural Association in the past, and has enabled it to perform what no other society of the kind has ever attempted, and this is the spirit which must animate it still. Believe me, if you act in this spirit you will never regret it, but will rather consider the honour and pleasure of having helped in such a work so great that you will say what I say now from my heart, namely, "I owe more to the Architectural Association than I can ever hope to repay."

Mr. MacVicar Anderson, president of the Institute of Architects, said he had taken the invitation to be present at the opening meeting as a compliment. Neither he nor any older members of the profession would be the worse for meeting with the young men of the profession; it would inspire them with some of the enthusiasm and vigour that was associated with youth. It had afforded him pleasure to be present, and to have listened to an address that was both interesting and able. Naturally the address had been devoted in considerable part to the subject of architectural education, and rightly, as nothing of more importance could have occupied their time and thought. They were by this time all familiar with the features of the new curriculum. It had been criticised as too wide and too diffuse in its scope. Such critics forgot what an architect was. A painter, a sculptor, a lawyer and other professional men had their studies limited. An architect, on the other hand, was a sort of hybrid creature, a man of business, an artist, and also a practical man. In wishing the new curriculum well, he hoped that what had been the great characteristic of architectural education, namely, office training, would never be submerged. The advice given in the address was admirable. But on one point their President was not competent to speak, viz. in regard of men of middle age. Their President was not old enough to speak personally. He (the speaker) was now verging on the sere and yellow leaf, and years had only confirmed him in professional love for his work. In his opinion fortune and prizes were open to those who adopted the profession with pure affection for architecture. He could not be expected to give an opinion as to the action of the Institute of Architects, but their President was a member of the Council, and his suggestions would be received with all favour and consideration. The aims of the two bodies were the same, though the functions of the two were very different.

Professor Kerr congratulated the President on his very able and eloquent address, which he said was a useful one not only to the members of the Association, but to the profession at large, who were equally interested in the success of the work of the Association. Professor Kerr noted, as a remarkable fact, and one peculiar to the architectural profession, that so much had been and was being done, and successfully done, for architecture by students. There might be peculiar circumstances attaching to the architectural profession—he would not go into that subject now—but whatever the peculiarities that did attach to the profession it was a matter of pride that the work of the students, who forty-five years ago had started on their career of education, had been carried on so steadfastly. Adverting to the number of students of architecture, those in the Association, those in the Institute of Architects, and many others outside both bodies, the question arose, What would become of them all? It was easy to express an optimistic opinion, and it was equally easy to give a pessimist opinion. The opinion he had held for years was that all students of architecture would not become practical architects. As time went on the number of students who become practical architects or assistants diminished. An architect's office, he thought, was the best school for training a votary of art. He could mention the names of many who had become distinguished in architecture, and the names of many who had drifted into the auxiliary arts, or, as they used to be called, the subsidiary or minor arts. These arts were not only most pleasing to pursue, but they were most profitable to pursue. The whole field of industrial design was open to the architectural student of the day. The architectural student trained in an architect's office acquired artistic knowledge of the philosophy of design, which was altogether different from that superficiation of design that characterised the goods in the shops of upholsterers, design that was perfect rubbish.

Mr. Aston Webb, in the course of his remarks, expressed his entire approval of the enlarged aims of the Association, and praised the arrangements of the studio in Marlborough Street. The classrooms and all appliances were admirable. He did not uphold the idea of paying students' fees for them. In many cases students valued advantages so offered them too lightly.

A vote of thanks to the President for his address, proposed by Mr. MacVicar Anderson and seconded by Professor Kerr, was put to the meeting by Mr. Leonard Stokes and carried by acclamation.

The President having replied, the proceedings terminated.

HAM HOUSE: ITS HISTORY AND CONTENTS.*

Of all the Surrey houses, this perhaps claims the strongest association with history, and our Society may be congratulated on having, through the courtesy of the Earl of Dysart, obtained permission to view a mansion hitherto regarded as an almost inaccessible treasure-house of antiquarian and artistic fame. The annals of its ownership are to be traced to Sir Thomas Vavasour, Marshal of the Household, who, in 1611, was appointed Judge of the Marshal's Court, conjointly with Sir Francis Bacon, afterwards Lord Chancellor.

The house would seem to have been finished in 1610, as that date, together with the words "Vivat Rex," is seen on the ornamental carving over the front door of the principal entrance. Subsequently, the house and its lands were secured to John Ramsey, Earl of Holderness, who died in 1624 or 1625, and who was created Lord Huntingtower and Earl Dysart by Charles I. It may be in memory of this honour that we notice among the several busts around the façade of this house one of that monarch. The eldest daughter of the above Earl Dysart married Sir Lionel Tollemache, Bart., of Helmingham, in Suffolk. This lady gained great influence at Court during the Interregnum, and she obtained a new patent from Charles II. (1660), whereby she was created Baroness Huntingtower and Countess of Dysart. Sir Lionel Tollemache died in 1669, and in 1671 the Countess married John, Earl of Lauderdale, afterwards created duke. He died in 1682, and his property, after being in the possession of his widow, devolved on her death in 1698 on her eldest son, Sir Lionel Tollemache, Lord Huntingtower, and has ever since continued in the possession of his descendants. Subsequently to the above period, several conflicting claims about the estate have taken place, almost down to the present time. The property is now vested in the Earl of Dysart, who entered into possession in May 1890.

Intimately connected with the house is the manor of Ham,† once a part of the royal domain, Henry VIII. having granted it to Anne of Cleves in 1540, as well as that of Petersham and Sheen, the whole being Crown property. We learn that Charles I. gave to Sir Wm. Murray a lease of this manor in 1636 or 1637, and created him Baron Huntingtower and Earl of Dysart in 1646. After the Restoration, in 1660, Charles II. granted to Sir Robert Murray a large extent of ground and the manors of Ham and Petersham in trust for the daughters and co-heirs of the late Earl of Dysart. The said manors then devolved on John, Earl of Lauderale, who married the widow of Sir Lionel Tollemache, the famous Elizabeth, Countess of Dysart, whose portrait hangs on the walls of this celebrated mansion.

The best and generally-known view of this house is from the Thames, and as approached by the meadows from the river the brick façade is before us, whose mellowed tints form a pleasing contrast to the sombre yew-trees and foliage which surround the main entrance.

The principal front is of brick, with stone dressings. Two projecting wings support either side of the doorway, which is flanked by arcaded recesses. These and the terrace walk give this part of the house some resemblance to Bramshill, in Hampshire, a famous Jacobean structure of the same period, but of greater richness of design and detail. The entrance doorway, supported by two marble pillars, is a good example of Renaissance work, which is more fully displayed in the decorative scrolls on the base of the pillars. The date, 1610, and the words "Vivat Rex," are seen in the upper portion of this doorway, and initials "T. M. V." for the builder. The principal approach to the house from the Thames is rendered more impressive by the large iron gates, and in passing along the garden walls are oval niches, containing busts of celebrated men, some twenty in number, made of lead and painted stone-colour. This decoration is carried out somewhat in the same way at Hampton Court Palace, where, in the garden front of that building, are busts of the Roman emperors, sculptured in terra-cotta. In the centre of the garden at Ham is a colossal and emblematical figure of the River Thames, executed in stone. We now, after surveying the principal front of the house, enter the great hall, an imposing and elegant structure, paved with black and white marble, and surrounded by an open gallery above, which leads into the different apartments. The general effect of the hall is striking, enriched as it is with old family portraits, antique furniture and china. We can, however, notice only the principal paintings, which are as follows:—1. *Louisa, Countess of Dysart*, by Sir Joshua Reynolds; 2. *Charlotte, Countess of Dysart*, by Sir Joshua Reynolds; 3. *Lionel, Third Earl of Dysart, and his Countess;* 4. *Lady Huntingtower*, by Sir G. Kneller; and others.

Passing through the hall, we turn on our left into a small private chapel, neatly panelled throughout, lighted by two windows, which are placed somewhat high up on the walls. On the communion table among the service books is a Prayer Book, the gift of Charles I. to William Murray, Earl of Dysart; on the covers the royal arms are wrought in gold and silver filigree work.

Retracing our steps into the hall, the great staircase leads to the state rooms above, all of which have their own rich artistic beauty and historical importance. The carving of the balusters on the staircase is worthy of notice, military trophies, shields and arabesque ornaments being gracefully intertwined, and forming a good specimen of the wood-carving for which the seventeenth century was famous.

We next enter the Round Gallery, overlooking the hall, and here are placed choice examples of china, antique vases, cabinets, and on the walls hang several family portraits, among which can be mentioned:—1. *The Dukes of Lauderdale and Hamilton*, by Janssen. 2. *Lady Worseley*, by Kneller. 3. *Duke and Duchess of Lauderdale*, by Sir Peter Lely. 4. *General Tollemache*, in armour; he was wounded when commanding an attack on Brest Harbour, 1694. 5. *Sir Lionel Tollemache*, and others. Besides portraits can be recognised paintings by Vandevelde, Wouvermans and like masters of the Flemish school; also by Watteau and other artists.

The series of rooms called the royal apartments next claim our attention, and this appellation may have arisen from the fact stated by some historians, "that the Court for the king is kept at Ham House." The proximity of Richmond Palace may very possibly have caused the visits of royalty to be made to Ham, and hence the association of the word "royal." Ham House was for a short time a royal residence, and Prince Henry, the eldest son of James I., dwelt here during part of his brief life. In the different rooms we now examine, is such a wealth of Jacobean furniture, paintings and other artistic gems that Ham may justly rank with such well-known houses as Knole and Penshurst in Kent, Petworth and Parham in Sussex.

Entering what is called the North Drawing-room, we find it hung with tapestry and decorated with an ornamental plaster-ceiling, enriched with gilt scrollwork. In this room are copies of Raphael's cartoons, possibly wrought at Mortlake, where Sir Francis Crane had established a tapestry manufactory, which was patronised by James I. and Charles I. The chairs here are replete with old embroidery and rich artistic design.

Before entering the Long Gallery, note the small but richly-decorated room in which are many fine miniatures, amongst them one of Catherine Bruce, wife of the first Earl of Dysart, painted by Hoskins in 1658. In a small cabinet is an authentic lock of hair of Robert Devereux, Earl of Essex, the ill-fated favourite of Queen Elizabeth.

From this room the Long Gallery is reached. This apartment is perhaps the most striking of all in the mansion, and may favourably compare with the famous Cartoon Gallery at Knole in Kent. This room, 80 feet long, is hung with portraits, chiefly by Vandyke and Sir Peter Lely, and its panelled walls are charmingly set off by the various inlaid cabinets and tables, carved and antique chairs, wrought in rich damask and other material and by many artistic treasures. Of the portraits of greatest interest and connected with the traditions of Ham the following may be selected:—1. *General Monk.* 2. *Sir Lionel Tollemache* (Lord Dysart), by Vandyke. 3. *Charles II.*, by Sir Peter Lely. (It is said the King sat purposely for this picture for the Earl of Lauderdale.) 4. *Sir Harry Vane and Charles I.* (Vandyke). 5. *Countess of Dysart.* This picture is known from others of the same lady by a black boy with fruit being introduced on the canvas. 6. *Elizabeth*, Queen of Bohemia, daughter of Charles I. Also portraits of Henrietta Maria, Lauderdale, and last, but not least, the artist Vandyke himself. It should be noticed that this Long Gallery measures the depth of the house from north to south, with a bay window at each end.

From the rooms on the south side of the house, on which we are now supposed to have entered, a view of the extensive garden and lawn is obtained, backed by dark firs and other foliage, and in the distance are seen the large iron gates, which once formed the main entrance, and are now disused.

These gates are of ornamental design, of the time of Charles II.; over the centre are the Lauderdale arms. In the far distance are seen the Ham avenues, almost a mile in length.

We now reach the room known as the Cabal Room, so called from the five ministers (Clifford, Arlington, Buckingham, Ashley and Lauderdale), whose initials make the word "Cabal,"

* A paper by S. W. Kershaw, F.S.A., hon. member, Société des Antiquaries de Picardie, read at the meeting of the Surrey Archæological Society, October 3, 1891.

† It may be in the recollection of our readers that the late Sir Gilbert Scott resided for a few years at the Manor House, Ham.

having held their secret cabinets here. In this and the adjoining apartments are to be remarked the fine marble mantels sculptured in relief, the inlaid floors, and the abundance of tapestry and silk hangings.

The Queen's Audience Chamber contains tapestry after Watteau of pastoral scenes, while the Duchess of Lauderdale's "boudoir," which adjoins the Cabal Room, is much to be noticed. On the polished parquet floor is the monogram "E.D.L.," surmounted by the ducal coronet, and at the end of this room are two handsome armchairs, under an arched recess, and which tradition assigns to the Duke and famous Duchess of Lauderdale. With the adornment of this part of the mansion must be associated the celebrated Countess of Dysart, who in 1672 married the Earl of Lauderdale, and it is said her influence had been greatly exerted over him in political matters. During the Interregnum she obtained so much power as to obtain a new patent from Charles II. in 1660, whereby she was created Baroness Huntingtower and Countess of Dysart. Her ambition and domineering spirit caused her to be disliked. She had a restless spirit, lived at great expense, and died in 1698, having survived her husband, Lord Lauderdale, sixteen years. It must, however, be conceded that much of the decorative richness of Ham House owes its origin to this lady, whose admiration for the arts is well known. It may not be inappropriate to mention a small picture-room, whose carved ceiling was painted by Verrio, and whose miniatures and cabinet pictures form a very treasure house of art. Here are likenesses of Queen Elizabeth by Hilliard, also of Mary Stuart, Charles XII. of Sweden, Mary d'Este (second wife of James II.), Louis XIV., by the famous artist Petitot, and several others. Descending from the upper to the ground floor, we find many apartments of interest, but hardly of such artistic merit as those which in this brief sketch I have been enabled to give you an outline. Other "stately homes of England" may possess collections more rich and rare, but Ham House claims especial importance as retaining all the traces of bygone history just as it was at this present day, and the county of Surrey may be proud in reckoning within its boundaries such a time-honoured mansion.

It would be incomplete were I not to mention the celebrated library, where rare Caxtons and other volumes have made the fame of the Ham collection known to all bibliographers. Among some of the Caxtons here may be noted Chaucer's "Canterbury Tales" (first edition), "The History of Godfrey of Bologne," "The Life of Jason," "The Mirror of the World" (first edition), "The Polychronicon," "Tully on Old Age," and "The Life of St. Winifred." Also a unique copy of the "Governail of Health."

When our survey has been made and the central hall again reached, one is irresistibly carried back to the times in which these houses were built, and to the influence and surroundings which prompted their erection. The early part of the seventeenth century witnessed the growth or commencement of several English houses of note. Bramshill in Hampshire, Hatfield, Audley End, and Charlton in Kent, may be named as some of the leading examples, while a number of smaller buildings were in course of construction. Inigo Jones was a ruling favourite. He was surveyor to Prince Henry (son of James I.), and his visits to Italy had not been without their influence on English art and architecture, in giving what could almost be called a second Classic revival and a foreign touch to many a detail of Jacobean work. All the buildings about England showed a tendency in this direction. The Universities of Oxford and Cambridge had Classic portions in many of their designs, which asserted themselves in several other examples, both in London and elsewhere. Later additions or alterations to such structures would constantly occur, and one is tempted to think this had been the case with the north or river front of Ham House, and that the projecting bays at each end had been once much more decorative; and this theory is supported by the fact which is known that the house was much enlarged in the time of Charles II., the garden front having been then erected by the Duke of Lauderdale, of whom we have before heard, as well as his wife, the famous Duchess. Whatever impressions such a house as this may leave on the mind, certainly it is of the wealth of art united with much that is historical, and it is a matter of congratulation that such buildings exist in a way we do not find on the Continent, and that they have escaped to a great extent the ravages of revolution and civil war.

Jacobean structures, such as Ham House and others, were but a sequel to those grand Tudor mansions which had sprang up so mightily over our land, and gave evidence alike of building skill and enterprise. Such houses have helped to form the history of our country and people, and in the altered conditions they exhibit in their structure we only see another interesting phase of art adapting itself to more modern requirements. The revival of letters had synchronised with the new ideas of the period, and in the joint re-birth, as it were, of art and letters we recognise one of the great moving forces in English Mediæval life so forcibly expressed in the pages of the late accomplished historian, J. R. Green. Though Ham House is of a somewhat later century, it is no less important as a link in artistic history, and fully illustrative of the ancient homes of "Merrie England."

ST. MICHAEL'S STEEPLE, COVENTRY.

THE request of the church authorities, "That in order to preserve a permanent record of the extent to which St. Michael's steeple leans towards the north-west, Mr. Councillor Andrews be requested to mark two points upon the pavement of the tower," has been carried into effect by him, with the assistance of two churchwardens to help in taking the measures. Our forefathers who constructed these splendid buildings, says the *Coventry Herald*, had no notion of cast-iron exactness. For instance, the clerestory windows appear to be of the same size and pattern. Yet during the restoration it was found that no two were exactly alike. A similar state of things is the case with the tower. Its four walls are of unequal lengths, and consequently it is not an exact square. The western wall is about 3 inches longer than the eastern wall. Therefore the method of finding the centre of a square by drawing diagonals between the four corners was not applicable in this case. The centre of the tower was consequently found by measuring at right angles from the centre of the four side walls. Measurements were then made from the side walls to discover the point occupied by the plumb-line when suspended from a point 267 feet from the ground, and the point beneath the centre of the weathercock, 290 feet high, was then adjusted, and two small holes drilled in the pavement, one at the centre of the tower and the other under the centre of the weathercock. The distance apart is 3 feet 5½ inches. Finally, a true east and west line was marked upon the pavement. The sides of the tower do not correspond with the four cardinal points. The new ordnance plan of the city shows a deviation of 9 deg. A line was therefore drawn centrally through the tower from the middle of the west wall to the middle of the east wall, and 9 deg. set off from the central point with a protractor. This was then tested by a compass, and, allowing for 18 deg. of magnetic declination, the line was found to be exact. The two points on the pavement are to be marked by brass plates, the one at the centre will be star-shaped, with the points adjusted to the true cardinal points.

Correspondence

Greek at the Universities.

SIR,—It has been announced that a grace will be offered to the Senate of the University of Cambridge on Thursday, October 29, at 2 P.M., appointing a syndicate "to consider whether it be expedient to allow alternatives, and if so, what alternatives, for one of the two classical languages in the previous examination, either to all students or to any classes of students other than those already exempted." As members of an executive committee, appointed last August by a meeting of resident graduates to oppose this grace, we trust you will permit us to offer, through your columns, reasons which, in our opinion, are sufficient to justify the course we propose to take.

1. The adoption of an alternative for one of the two classical languages in the arts' course at the Universities would tend to the extinction of the study of Greek in all but the greater public schools. A knowledge of Greek would thus cease to be within the reach of the sons of many professional men, and of the middle-class generally. In the interests of the smaller schools and of parents of limited means, we deprecate any change which would eventually place it among the luxuries of the rich. The whole history of education shows that the study of Latin has never flourished apart from the study of Greek.

2. We know of no alternative which may be regarded as a worthy substitute for a classical education. Experiments which have been tried are at once too recent and too indecisive to justify legislation upon the basis of their results. If not ideally perfect, the present system possesses advantages which cannot be claimed by any other with which we are acquainted. It has been matured by long use, it supplies a training which is definite and precise, and yet subtle and refining; its tendency is to widen the range of thought and to counteract the too exclusive interest in present and visible surroundings, which is a growing danger of modern life.

3. Beside its educational value, the study of Greek has a quite unique importance in connection with literary and scientific work, which forbids us to regard with equanimity a proposal to dismiss it from the place it has held in England since the sixteenth century. We regard the Greek language and literature as the ultimate basis on which all literary study, in the highest sense of the word, must rest. Nor can we forget

how largely the language and thought of ancient Greece enter into other subjects of knowledge. The loss of Greek could not fail to make itself felt in every profession; and, in particular, it is scarcely necessary to point out how serious a misfortune it would be if many candidates for holy orders should have received no training in Greek.

4. Those who desire a change, while commonly admitting the educational and professional importance of Greek, allege several reasons why, under present circumstances, some alternative for Greek should be allowed. We ask leave to deal with the weightier of these arguments in as few words as possible. (*a*) It is contended that modern requirements have brought so many new subjects into the course of schoolwork, that no room is left for the teaching of Greek. But the proper end of school life is to educate the mind rather than to fill it with facts; and all experience goes to show that schoolboys who have followed the old classical course are at no disadvantage in their future life, as compared with those who have taken modern subjects in lieu of Greek. (*b*) It is urged that the amount of Greek that can be required in the previous examination is so small as to have no value. If this argument has any force it applies equally to all the subjects in the previous examination. But even an elementary knowledge of Greek has an educational value of its own, not always recognised by the student himself, but not on that account to be overlooked; and it may always be carried farther at a later time in life by those who have made a beginning. (*c*) It is urged that men who have not had the advantage of a classical education at school suffer hardship by being excluded from the older Universities. But it seems sufficient to answer that the loss incurred by such students is not to be compared with that which would ultimately arise from the abandonment of Greek. And students so circumstanced can obtain the advantages of a University training and degree from other academical bodies, which do not require a knowledge of both the classical languages. (*d*) Lastly, if it be asserted that the progress of the science school in Cambridge is hampered by the requirement of two classical languages, we reply that the growth of that school during the last ten or twelve years is the most notable feature in the recent history of the University.

5. Many who have followed us so far will demur to our purpose of offering opposition at this early stage. It will be said that the appointment of a syndicate pledges the University to nothing beyond discussion. But the subject has been discussed in Cambridge more than once. In 1870 and again in 1878 a syndicate was appointed to consider this question, and the deliberations of the second syndicate lasted a year and a half. On each occasion, although the syndicate reported in favour of change, the Senate refused to sanction it. It may be urged that the last of these decisions was reached eleven years ago. But there is no reason for supposing that a third syndicate would have fresh arguments to lay before the Senate. And, in another shape, the question of Greek has been again decided by a recent vote of the Senate. Within the last two years the entire system of pass examinations has been laboriously revised, and, after a vote, both classical languages were retained in the general examination. Under the circumstances we submit that the present demand for a reopening of the question is not justified, and we cannot but regard as mischievous the expenditure of time and the agitation it would involve.

We rejoice in all signs of true progress, but we are convinced that the abandonment of Greek as an essential factor in a liberal education would be a retrogressive measure. We beg the non-resident members of the Senate who think with us to come up to Cambridge on Thursday, October 29, and record their votes against the grace in numbers which may not only secure its rejection now, but save the University from similar proposals for years to come.

A Model from Vienna.

Sir,—You have for years allowed me to plead in your pages for a more liberal use in the architecture of the City of London and of other fuliginous towns of those hard but beautiful and imperishable materials to which Phillips was, I believe, the first to give the name "pyrogenous," my argument being that the requisite machinery for their economical conversion having been invented, and railways and ships having penetrated almost into the heart of the quarries yielding them, all that was required to enable us to build with them as cheaply as with freestone, handsomely worked, was a suitable and characteristic mode of architectural treatment. Perhaps I ought now to be satisfied, for granite building is certainly in great favour in the City, and must inevitably command increased approval if the last requirement I have mentioned be secured. It is, I believe, an admitted axiom in design that each material must have its own special consideration. I have done something to illustrate this matter (*The Architect*, June 6, 1890), but I suppose the result was so novel, so rich in colour, and therefore would have been so subduing and even killing to surrounding drawings in the usual black-and-white rendering that the selecting committee of the Royal Academy refused to permit the public to see it. As I do not know the names of the committee I have not been troubled in spirit in the slightest degree. But to the object of this letter, "A Model from Vienna." I need not take up much of your valuable space, because most, if not all, of your readers will have seen the description in Monday's papers of the new museum of art in the Austrian capital. My purpose will be served by briefly and simply copying the names of the materials used—used externally, for my efforts to get porphyry, granite and other igneous rocks appropriately treated are entirely and solely applicable to outside work. The writer says:—"The new museum of art is an edifice which, by the magnificence of its architecture . . . is a glorious proof of what art in the present Emperor's reign is able to produce . . . the style and character are entirely modern . . . for those who wish to see the perfection of technical art, the display of wealth of colour, Vienna is the place to come to . . . red Swedish granite and the most valuable pink, grey, yellow and white marbles of Italy and the Alps have been used. The steps of the staircase from Carrara are 18 feet wide. The great columns are of brilliant noir antique. The smaller are of precious Porto Venere."

The opening of this beautiful museum is of the utmost importance to the entire art-loving world, for it contains under one roof all the treasures of art which the Imperial house has collected during the last 400 years. Baron Hasenauer is the architect, but Semper, I believe, had something to do with the design.

Streatham: October 20. Henry Travis.

The New Lock and Handle.

Sir,—In your description of the new lock and handle which you gave in your last week's issue, and which in the main was accurate, you omitted a most important point which by your kind permission I should like to supply, namely, that this patent lock is about 20 per cent. cheaper in its original cost than anything durable that has ever been previously made. This invention is the result of three years' thought and experiment of one of our largest timber-merchants, and the collection of locks which he has in his workshop, showing his ideas of a model lock in a crude state to its present perfect development, would interest any of your readers. In the company which will shortly be brought out, its history and advantages will of course be fully detailed. Will you kindly note that my name is not as inserted last week, but that I am, sir, your obedient servant, T. Freeman.

200 & 202 Phœnix Street, St. Pancras:
October 21.

Sir,—I read in your last issue of yet another new lock, which I heard of with regret, as ironmongers are already worried with the number and variety of locks they have to keep in stock. The new lock will have to be an exceptionally good one if it is to have any chance of competing with the admirable locks that are at present supplied by Chubb, Hobbs, Hart, or, coming to a cheaper article, those supplied by James Hill and others.—Your obedient servant,

Ironmonger.

CHURCH BUILDING AND RESTORATION.

Carshalton.—The corner-stone of a new chancel in course of erection at the old parish church of All Saints has been laid by the Duchess of Albany. The walls and roof being unsafe, thorough restoration aud repair was deemed to be necessary. The present church stands, it is believed, upon the site of one of the earliest churches built in England, and contains in its nave some traces of Norman work. But the whole structure has been altered and enlarged at such diverse periods that it possesses no particular style or harmony of its own. Sir Arthur Blomfield, A.R.A., is the architect of the new chancel, which is to be in Perpendicular style, and it is estimated that the additions and improvements will cost about 10,000*l*.

Ebbw Vale.—The fine church, Christ Church, which may be called the cathedral of the surrounding valleys, has been reopened, after undergoing elaborate alterations and improvements. The interior has been redecorated; the tower, which was not previously finished, has been completed, with new wooden floors, large double doors, and ceiling, windows glazed,

&c.; new handsome brass gas standards, a gift from Dr. Davies, have been fixed in the choir; and the Welsh church, underneath the chancel, has also been cleaned out, and finished in colour. The church has a large nave and aisles, with massive columns to the arcades, and a fine apsidal chancel a good height above the nave, approached by a flight of bold steps, giving the structure a lofty and good general appearance. The chancel decoration may be thus described :—The upper portion is in blue, resembling the firmament, with large and small gold stars dotted here and there ; the middle portion is of buff, with Indian red ornament separated from the top by a string of ornament (the True Vine) and with Tudor roses, &c., over the arches, while the lower portion is a series of crocketted gables on columns, with the arches and cusping under in green, red, purple, black and gold on a light red ground. The Crown of Glory is depicted over the altar between gables. The whole is carried out from designs and under the superintendence of Messrs. Kempson & Fowler, architects, Llandaff. The builder was Mr. W. Morgan, of Ebbw Vale, and the decorator was Mr. J. E. Morgan, of Canton, Cardiff.

Selby.—The abbey church at Selby has been reopened after restoration. The portions of the old church which have just been dealt with are the choir and north transept. Twenty years ago the nave was restored under the direction of Sir Gilbert Scott. The improvements just made have been carried out under the superintendence of his son, Mr. J. Oldrid Scott. The south-west wall and the clerestory above have been rebuilt, whilst the floor has been raised to the old level. The old miserere stalls have been restored, but the fronts are entirely new. The north transept has been underpinned, the lead on the roof has been recast, the arcading on the sides of the aisles has been attended to, and the parts of the edifice east of the tower have been thoroughly overhauled. There are other parts of the abbey still needing attention. Two hundred years ago a fine tower fell, demolishing the south transept in its descent. These should be rebuilt. The cost of the work has been about 8,000*l.*

St. Donat's.—The ancient Welsh St. Donat's Church, an interesting fourteenth-century church, has been reopened, after undergoing a thorough restoration. The old church was fast going to decay. The open oak roof (a fine specimen of construction) was dangerous, the plastering was perishing on the walls, the floor was damp and unhealthy, the windows were badly glazed, water came in through the tower, the tower itself was cracked and in an unsafe condition, and there was neither light nor heat in the church. In addition, Godwin's tile floors have been placed in the chancel, and a new wood-block floor under the chairs on concrete, a new oak pulpit, altar, lectern, font-cover and chair have been furnished, all the windows have been newly glazed in fret lead, new seats have been placed in the chancel, two new windows have been provided, &c. The cost of the entire work has been about 700*l.* The contractor was Mr. W. A. James, of Cowbridge, and the architects Messrs. Kempson & Fowler, Llandaff.

SCHOOL BUILDINGS.

Castlethorpe.—New Board Schools have just been opened. The schools are situated in the centre of the village, and are built of brick, with Bath stone dressings. The roof is of Broseley tiles, and over the principal entrance is a small tower and bell-cot. The rooms are adapted for the accommodation of about 150 children. The architects were Messrs. H. H. Dyer & Son, Newland Chambers, Northampton, and Messrs. Adnitt & Everard, of Rushden, were the builders.

Longsight.—The memorial-stone of the new Catholic Day Schools at Longsight was laid on Saturday, the 17th, by Sir Henry Roscoe, M.P , in presence of the Bishop of Salford. The schools are erected in Richmond Grove, consist of two storeys, about 100 feet by 35 feet, are faced with Ruabon stocks, and accommodate about 500 children. The contractors are Messrs. Wilson & Toft, of City Road, Manchester, and the architects are Messrs. Heathcote & Rawle, of 6 Princess Street.

Leeds.—Two new schools have been opened for the Leeds School Board. One is a day industrial school, situated in Czar Street, Holbeck, and the other an elementary school at Harehills, Roundhay Road. The principal contractors have been :—For the brick and masonry and carpentry and joinery, Messrs. Gould & Stevenson ; for the ironwork, Messrs. Taylor & Parsons ; for painting, Mr. G. Thompson ; for slating, Messrs. Atkinson & Son. The works have been carried out from the plans and instructions of Mr. Landless, architect to the board. The cost of the site was 1,221*l.* 17*s.* 4*d.*, and the estimated cost of buildings and fittings 7,000*l.*

Arrangements are to be made for lighting the Mansion House by electricity, at a cost not exceeding 1,500*l.*

GENERAL.

Sir James Kitson has presented *The Return of Persephone*, painted by Sir Frederick Leighton, P.R.A., to the Leeds Fine Art Gallery.

The Thirty-first Annual Exhibition of the Glasgow Institute of the Fine Arts will be opened on February 2 next, the Council having found it advisable to return to the old date. Acting in the interests of the artists who kindly contribute to the Exhibition, the Council have resolved to limit the number of works which each contributor may submit to two—the same as in the Paris Salon.

The Birmingham Art Circle opened their winter exhibition on Wednesday. Fifty-seven paintings and drawings have been hung.

The Royal Society of British Artists, at a general meeting held on Tuesday, elected Messrs. F. W. Davis and Sutton Palmer as members.

The School of Art Wood-carving, City and Guilds Institute, Exhibition Road, South Kensington, has been reopened after the usual summer vacation. One or two free studentships in both the day and the evening classes are vacant. These studentships are maintained by means of funds granted to the school by the City and Guilds Institute.

The Council of the Senate of Cambridge University recommend the acceptance by the University of the bequest of the late Mr. W. K. Foster of his collection of antiquities, and that the prehistoric and Anglo-Saxon portions be kept and exhibited together in the Museum of General and Local Archæology, and be designated "The Walter K. Foster bequest."

The Statue of the Queen, which it is proposed to have erected in London, is estimated to cost 12,000*l.* or 13,000*l.*, and designs submitted by several eminent sculptors have already been tentatively considered. Various sites have been suggested for the statue, but no site seems to find stronger support than a spot facing the Horse Guards parade, just within the railing of St. James's Park.

Mr. Alfred Gilbert, A.R.A., has been commissioned by the committee of the Bombay memorial of Sir George Birdwood to execute a bust of that gentleman in bronze for the Bombay University hall. A medal of Sir George Birdwood is also to be struck.

Mr. J. W. Tottenham has presented a collection to the Hastings Museum of the value of 10,000*l.*

Mr. Walter Merrett has been selected to execute a marble bust of the late Alderman Sir R. N. Fowler, M.P., for the Guildhall.

Probate Duty has been paid on 27,787*l.*, as the net value of the personal estate of Mr. Keeley Halswelle, R.I., A.R.S.A., 4 Albemarle Street, Piccadilly, and Stower House, Steep, Hants, artist, who died at the Hôtel de Lille et d'Albion, Paris, on April 12 last, aged fifty-four.

Manchester Society of Architects.—The awards of prizes in the students' competition have just been made by the Council. The Society's first prize of 10*l.* goes to Mr. Roger Oldham, and the second prize of 5*l.* to Mr. A. Jennison. Mr. H. E. Sterry has gained Mr. Holden's prize of five guineas.

Mr. George Reid, P.R.S.A., has been appointed a Commissioner of the Board of Trustees for Manufactures in room of the late Sir William Fettes Douglas.

Mr. C. Purdon Clarke, Keeper of the Indian Museum, has been appointed Principal Keeper in the South Kensington Museum, in succession to Mr. G. Wallis.

The Plans of Mr. Thomas W. Cubbon, architect, of Birkenhead, have been unanimously adopted for new lecture-hall and Sunday-school buildings in connection with Milton Congregational Church, Widnes, accommodation being provided for 550.

The New Pavement in the choir of Peterborough Cathedral is being laid down by Italian workmen. It is to cost 2,000*l.*, which will be paid by the Dean. A new reredos is also to be erected.

An Eiffel Tower and Winter Palace is proposed to be constructed at Brighton, and a limited company has been formed to promote the scheme.

The Surveyors' Institution will hold the first ordinary general meeting of the session 1891-92 on November 9, when the president, Mr. R. C. Driver, will deliver an opening address.

The Halifax Technical Committee are about to invite competitive plans for the erection of a technical institute in Hopwood Lane, on the west side of the People's Park.

A New Chapel has been erected at Hereford which has been ventilated by the "Climax" Ventilating Co., of 15 Great George Street, Westminster, S.W., whose direct-acting ridge ventilators have been used for the exhausting of the foul air, in conjunction with their improved air-inlets for the admission of fresh air.

The Architect.

THE WEEK.

The owners of insanitary property have reason to rejoice, for the Courts appear to be on their side. That their rusty ægis can still shelter abuses is evident from what has just occurred in Liverpool. Last year the grand jury condemned certain property because it was insanitary. Soon afterwards the value had to be determined. For that purpose the Board of Trade appointed Mr. Hunter Rodwell as arbitrator, and from his long experience as a leader of the Parliamentary Bar, his qualifications were undoubted. It was held, as a result of the inquiry, that when property is condemned by the local authority it cannot be occupied, and therefore ceases to have a rental value. That is a common-sense deduction from the action of the authorities, but it was not accepted by the owners of the condemned property in Liverpool, and the case was brought before the Divisional Court and the Court of Appeal. The decision of the superior Courts was, to put it shortly, that the arbitrator should not have considered the condemnation of the property, his business being the discovery of the market value. A surveyor would find a difficulty in comprehending the Courts' doctrine, for it is impossible for property to be unaffected in the market by circumstances that are notorious and of a depreciating kind. Purchasers of houses are only mortals, and are not given to abstraction; but their lordships suppose, no doubt, it is as easy to ignore the defects of property as to imagine the site on which it stands as having length and breadth but no thickness. The question of value of the condemned property in Liverpool was again ordered to be investigated by Mr. Rodwell, and the difficulty of his task will be understood from his own description of it, for, *per se*, the order of demolition was not to affect the value, but he was not to throw out of consideration what were the circumstances which led to the order. A more difficult mental feat could hardly be imagined. The fact was that if sanitary conditions were a standard, the houses were worth no more than would be given for them by a dealer in materials. A fortnight ago the second investigation was held. As a result Mr. Rodwell awarded the owner of eight houses 468*l.*, or 58*l.* 10*s.* per house; the owner of sixteen houses 135*l.*, or 8*l.* 10*s.* per house; and the London and North-Western Railway Company 117*l.* for six houses. This may be taken as about nine years' purchase of the assumed net rental, taken on the average of seven years prior to condemnation. It must be considered as far too high a price for the ratepayers of Liverpool to give, but the Courts would allow at least 50 per cent. in addition, and if there should be an appeal it is possible a much increased amount will be awarded. Local sanitarians may well hesitate about improving a town when they discover how precious, when seen from a judicial standpoint, are structures which are not safe enough to shelter cattle.

On Wednesday Mr. James Orrock gave a lecture in Manchester on "English Art," in which he referred to the peculiar position of England in having no recognised school. He pointed out that the French had been our fairest judges, for Constable, and now Reynolds, Gainsborough, and Crome, occupied a very high place in their esteem. Presently they would discover that John Constable, the founder of the fashionable and costly Barbizon school, was only one of our many masters who could each found a school of his own. This no-school of England had the living and lasting foundation of many schools, reckoned by the number of its masters. Long might we have literally no school, no leaping and racing after the bell wether. The beginning of a so-called school invariably meant masses of imitators who provided for the public the skim-milk of the art. Our art needed studying, not developing; it was full grown already, and had been so for a hundred years. Our little island was a quarry of fine art, out of which were shipped annually tons of masterpieces. There were more fine pictures sold in London than in all the world besides. We had produced the most exquisite embroideries and needlework which adorned some of the Catholic sanctuaries in Europe. Our mezzotint engravers had no rivals, and this applied to wood and line engravers also. We bought more foreign pictures than all the world, and the hall-mark of London must be secured for all works of great value. We had more fine Dutch and Flemish pictures than the nations put together, and we bought Rembrandts, Cuyps and Holbeins when their countrymen were starving them. If all this did not show us to be an artistic nation, what did it show? It was a remarkable coincidence that on the day when the lecture was delivered Mr. Agnew, among other gifts, had presented Turner's drawing of the *Salisbury Chapter-House* to the Wentworth Institute. Manchester alone probably contains as many paintings that were gifts as all the towns of France—if we omit those which were presented by the Rothschild family.

The provincial exhibitions in France are advantageous for artists. Out of one recently held in Rheims the sales of pictures amounted to 83,283 francs. The exhibitions are generally controlled by local amateurs, who endeavour to make them successful. Care is also taken to regulate the periodicity of the exhibitions by the wealth of the district. In Rheims only twelve exhibitions have been held since 1869, and as the sales amounted to 910,078 francs, the average has been 75,839 francs. It is evident also that this year's purchases exceed those of the past years, and it may be assumed that the next exhibition will be still more prosperous. Similar exhibitions, with guaranteed local support, are now being held in Nancy, Roubaix and Rouen, while next month one will be opened in Angers.

Mr. E. L. Hussey has enriched the Kentish collection in Lambeth Library with an important gift of prints and drawings of the late Mr. Hussey, architect. They represent churches and domestic buildings in the county of Kent. Several interesting details of Leeds Castle, Addington, and other houses are among the sketches, which will be of value to the student of Mediæval work. There are also many drawings of church furniture and antiquarian fragments, in all about two hundred examples. The Kentish collection is now becoming so representative as to require a printed catalogue, which is in preparation. Meanwhile, if unknown (as seems to be the case), these prints and drawings are readily accessible, with the other contents of the library, daily, on application to Mr. S. W. Kershaw, F.S.A. (except Saturday), from 10 A.M. to 4 P.M.

It is intended to open a museum in Alexandria mainly for the reception of objects of the Greco-Roman period. The director will be a Frenchman, M. Grebaut. A part of the contents of the museum at Ghizeh will be transferred to Alexandria, and in course of time it is expected that many things will be presented. It is understood that the museum and contents will be Government property, but donors will be able to stipulate if they desire that their presents are to be considered as the exclusive property of Alexandria. The Egyptian authorities profess to be unable to bestow much money on anything that relates to archæology. In order to uphold the museum, a charge of a shilling will be levied on visitors unless during one day in the week.

A new edition of "Rivington's Series of Notes on Building Construction" is in course of publication by Messrs. Longmans, Green & Co. The value of the work is evident when it is known that the present edition is the ninth of Part I. The alterations and additions consist in the transference of chapters on rivetting, centres, built-up beams and plate girders from Part II., the addition of eight plates taken from contract drawings, and a general revision. Part I. is now increased by eighty pages, and the number of cuts is nearly doubled. The addition of examination papers is also a boon for students. The "Notes" have been a treasury for compilers of similar books, and it would be difficult to estimate the limits of their utility. In their revised state they will be no less serviceable to students of architecture and building, for they are the best guides to construction.

THE BRITISH ARTISTS.

THE walls of the galleries of the Royal Society of British Artists are occupied this year by paintings and drawings that are more varied in quality than usual. It is in the galleries of the Society that many an able artist first gained a name, and everybody is disposed to make the best of the collection, in the belief that most of the works were produced by beginners. But this year much is seen which is not praiseworthy, unless we can admire the efforts of young people to appear as artists in spite of the privation of natural gifts and adequate training.

The one painting which cannot be passed without attention is *The Kingdoms of the Sun*, by Mr. Edwin Ellis. It requires a wider gallery and a higher position to be properly seen, but, with all drawbacks, it is most impressive as a representation of a moment when a change is impending among the clouds. The darkness which appears amidst the brightness is much bigger than the proverbial man's hand, and the rigid lines of the mass of vapour recall the towered citadel and pendent rock which Marc Antony beheld amongst black vesper's pageants. As a representation of aerial force of a kind that does not commonly appear in paintings, although no doubt it was observed, Mr. Ellis's work is successful. But is it for the sake of contrast that he paints so tame a sea for the bottom of his picture? Another startling work is *The Ferry*, by Mr. Cayley Robinson. In the boat we see a sort of Japanese shepherdess with a flock of goats, drifting by a bank on which tall lilies grow with almost mathematical precision. A picture of this kind is not seen every day, and if the elements seem incongruous, there is no doubt they are well painted. If there was more haziness in the lighting the attraction of the picture would no doubt be increased. In spite of its size and novelty the price of the picture is only 70*l.*, and, in fact, low prices prevail this year.

In the same room is an exceptionally large water-colour drawing by Mr. W. J. Morgan, *Old Cronies*, three men drinking, which is skilful in characterisation and quiet in colour. The settle, heavy chair and table aid in giving relief to the figures. Mr. Wyke Bayliss, the president, has two of his four architectural drawings in the room. The cathedral, Aix-la-Chapelle, is an exterior, a rather unusual subject with the artist, and, although somewhat cold, is suggestive of the building. The *Westminster Abbey* does not express the colour of the stone which is used in the interior of the Abbey, and Mr. Bayliss would find it advantageous if he turned during a year or two to Renaissance or other round-arched buildings, for he appears to be tending towards the conventional, or rather the stereotyped, in his later drawings, and is not sufficiently discriminative in treating Gothic buildings. Mr. Harding Smith has a drawing of San Zeno Maggiore, Verona, in which he does justice to one of the noblest examples of Italian Romanesque, and the treatment seems to be in keeping with the style. The view of Canterbury Cathedral from the garden near the baptistery denotes that the artist can be no less successful in representing Gothic work.

The single contribution of Mr. Sidley is called *The Miller's Daughter*, but many other titles would serve as well for the young lady who is represented. It is, however, very carefully finished in figure and background, and the style saves it from appearing to be a survival of the subjects in the ancient "Annuals." If Mr. A. E. Proctor's *Willow Walk* appeared as the work of a Frenchman, it would be praised for its softness and the tendency to blackness in the trees. There is no better manipulation in any of the landscapes of the gallery, and the general quietness is a creditable result. Mr. Kingsley's *Year's Decline* is almost as impressive as a work by Mr. North, whose colour and handling it recalls. Among Mr. Carlton Smith's pictures, the single figure of an Italian peasant girl, *Waiting*, is one of the most pleasing. The *Breaking Waves*, by Mr. Mottram, shows a timber groyne of a very dark brown against which a wave breaks into foam, with that excess of force which is necessary in a pictorial subject. Mr. Glendenning's *Heath and Bracken* was evidently produced by painstaking labour, but the general effect does not appear to have been considered, and hence it is too spotty. Mr. W. G. Foster's *Fisherman's Plot* is a picturesque bit of greenery. The four works by Mr. Yglesias in the room are satisfactory from the vigorous manner of grouping trees and flowers. Mr. H. H. Canty's *Rosebuds*, a girl and child in a garden, is smoothly painted, but graceful. Mr. J. Frazer must have been fortunate in finding a very bright day when painting his *Sheerness*, which appears to be an ideal watering-place. One of the best landscapes is Mr. Stuart Lloyd's *Harford on the Ouse*, in which the old church and the river are worthily depicted. He is also successful in Ely, where the cathedral is seen under a glowing light. Mr. J. L. Pickering, in his *Pine Wood*, has selected a moment when the trees become more sombre by a delicate light that glances on parts of the trunks. The *Doreholm*, by Mr. Frazer, shows a small island not unlike the Bass Rock surrounded by the sea. Mr. Birkenruth's *Amrai's Garden* represents a girl of a Bavarian type in white in a garden. This work is painted with skill and certainty of process. There is no other work by the artist in the room, and his limits are therefore unknown. Shakespearean subjects are out of fashion, and Mr. Eyre is to be commended for venturing on such a work as *Rosalind and Celia*. If the pair do not correspond with one's ideals, they are at least well drawn. Mr. W. H. Pike has a dramatic scene, *Too Late*, which at first sight suggests a highway robbery, especially as the figures in the foreground are of a criminal type, but it appears a duel has been fought, and a lady has not been in time, owing to using a lumbering coach, to prevent it. The picture is dramatic enough, and is painted so as to be seen at a long distance.

In the South-east Room there are some fine landscapes, *Tangiers*, by Mr. A. Mann; *When the Evening Sun is low*, by Mr. Proctor; *At Eventide*, by Mr. Watson; *In the New Forest*, by Mr. Holmes; and *A Berkshire Hayfield*, by Mr. Snell, being among them. Mr. Yeend King's *Girl Feeding Ducks* would be more successful if it were not for a spottiness that is unusual with the artist. Mr. Sheridan Knowles reveals great progress in his portraits, and his *Old Garden* shows skill of another sort. Mr. L. C. Henley is as careful as ever with his figures in the costume of the early part of the century. Mr. Hamilton Jackson has four excellent works, his *Spring has come*, an old Roman scene, being the most important.

Humour is rare of late in exhibitions. Mr. Strutt's *Family Broils*, a contest between cats and puppies, and Mr. Finn's *Is it genuine?* a scene in a broker's shop, where vendor and buyer are alike puzzled about the merits of a picture; Mr. Morley's *Eavesdropping* and *Poached Eggs* are all pleasant pictures, and are most welcome this year. Among works of different classes which merit notice are *Sunshine and Showers*, by Mr. Rouse; *Different Versions*, by Mr. Almond; *A Thames Mill*, by Mr. Proctor; *A Pastoral*, by Mr. F. H. A. Parker; *Curiosities*, by Mr. Lomax; *'Twas ever so*, by Mr. Bundy; and *Sundown*, by Mr. Dawson. If a good many of the pictures, which are not worthy of the galleries, could be removed, there would be more chance of justice being secured by the remainder. This year the search for signs of talent is not easy.

A SYDNEY HOSPITAL CASE.

WE have received a couple of blue-books from Sydney, N.S.W., which are evidence that two important building schemes have occupied the attention of the Parliamentary Standing Committee on Public Works. In both cases difficulties arose out of the evidence of the architects.

The first scheme related to a hospital in Macquarie Street, Sydney. Some years ago it was alleged that some of the walls of the old Sydney Hospital which stood in the street were affected with hospitalism, which interfered with surgical cases, and accordingly the front buildings were pulled down. The wings, being in a sound condition, were allowed to remain. It was arranged that front buildings should be erected out of a sum of 20,000*l.* which had been subscribed for a memorial to commemorate the escape of the Duke of Edinburgh from a murderous attack. The money was, however, used for the erection of the Prince Alfred Hospital.

After a time some money was obtained and more was promised towards the rebuilding of the front part of the Sydney Hospital. Designs were accordingly sought in a

competition, and it was stipulated that the outlay should not exceed 45,000*l.*, and every design was to be accompanied by a certificate from a builder to the effect that the design could be carried out for such a sum. The choice fell on a design by Mr. Thomas Rowe, who has had thirty years' experience as an architect in Sydney. Strange to say, there is no certainty about the builder's certificate in his case. Mr. Rowe believes that one was sent in, the secretary of the hospital is of the same opinion, but the document is not forthcoming. Mr. Rowe maintains that his building could not have been carried out for 45,000*l.* With slight brickwork and in an inferior manner the design might be realised for 50,000*l.*, but the architect says that to have completed the work in a substantial manner over 150,000*l.* would be needed. It was, however, stated by a builder before the Parliamentary Committee that a design by another of the competitors, Mr. Kirkpatrick, need not cost more than 45,000*l.* for its realisation.

Building committees have a habit of acting in a way that would not answer in ordinary business transactions. Instead of excluding Mr. Rowe's design on the score of not being in accordance with the conditions of cost, it was decided by the Hospital Committee to make it still more costly. Mr. Rowe was asked to prepare a new design in which some of the features in the premiated designs were to be included. One of the wings was also to be taken down and a new building erected in its place. It was also decided to use stone instead of brick for the walls, which in Sydney meant an additional cost of from 20 to 25 per cent. The number of beds was increased from 180 to 264. The Building Committee apparently considered they were possessed of an enchanter's wand, and could make buildings arise from the ground. What followed is thus described by the Parliamentary Committee:—

> The probable cost of the buildings designed in the first instance by Mr. Rowe he was, he states, never asked, and the probable cost of the enlarged design does not appear to have been known to the Board until after several contracts in connection with the erection of the new buildings had been carried out. The buildings were, in fact, commenced and raised to a certain height without the Board having any definite idea of the money that would ultimately have to be expended upon them, and it was not until 68,923*l.* 7*s.* 8*d.* had been spent and operations had come to a standstill, in consequence of the late Sir Alexander Stuart refusing the Hospital Board a further grant of money, that calculations to get at the cost of completing the buildings were made. It was then found that the amount required to complete the work was 140,000*l.*, making the total cost in round numbers 209,000*l.*

This agreeable information was duly conveyed to the Government in 1883, but what Financial Minister could deal with a case where the actual was nearly five times the anticipated cost? The works were suspended, and we believe they have not been as yet resumed. As is not uncommon when building enterprises fail, the wisdom shown in the utilization of the site of the old hospital was doubted, and the subject gave rise to much official correspondence. It was suggested that temporary wooden buildings should be erected, but the Government would have no substitutes. The affair was complicated by the circumstance that Mr. Rowe's plans had been approved by the Government, but it was understood that what was represented by them was a building that was to cost 45,000*l.* In fact, all the parties concerned in the case appear to have muddled it after well-established British precedents. There is no use in censuring them.

But while the confusion was becoming more confounded the poor in Sydney and the country around who needed a hospital must have suffered. An application was accordingly made in 1887 for authority to erect a building that would not cost more than 56,000*l.* in addition to the sum expended. It would have one storey less than was intended and 144 beds instead of 264. Sir Harry Parkes agreed to the proposal, but it was not until 1890 that his Government gained sufficient courage to ask Parliament to vote the money required. Subsequently it was decided to refer the subject to the consideration of the Parliamentary Standing Committee on Public Works.

It did not take long for the committee to make the discovery of being in a cleft stick. It seemed vain to inquire into the history of the misadventure, which seemed to have originated in the rivalry and jealousy of physicians. The new Prince Alfred Hospital made all concerned in the reconstruction of the old hospital eager to make it as fine as its younger rival. The architect said, "I knew what the work would cost, but I was never asked; and was it my duty to force my business upon the committee? The committee were vying with the Prince Alfred Hospital people, and the desire was to have a city hospital equal if not superior to the Prince Alfred Hospital. There was no desire to know the cost, I am sure of it. There is no letter in existence finding fault with me or my conduct in connection with this hospital building. The secretary cannot produce such a letter, and I have none. For five years I was never asked the cost of that building, and I have never received a letter complaining of its cost." That more expense was contemplated than was named in the conditions would appear to be inferred from the evidence of Mr. Horbury Hunt. He related how he objected to the smallness of the specified sum, and the reply was, "Mr. Hunt, do you suppose we are going to stick at 45,000*l.* for a building that we take a fancy to?"

The main question to be considered was whether the work already executed and on which nearly 69,000*l.* had been dispensed was to be entirely abandoned. The plans which had been carried out so far as that sum of money admitted were considered by their author as being perfect. The committee say:—"Twelve years have passed since the original plans were prepared, during which period the architect of the buildings, Mr. Rowe, has travelled in England and on the continent of Europe, where he visited many of the largest and most improved hospitals, and he states that he saw nothing to show that his plans for the buildings in Macquarie Street could be improved in any matter essential to hospital construction. But buildings after plans so perfect could not be erected for less than 140,000*l.* in addition to the 69,000*l* already expended. The amended plans for buildings of three storeys instead of four and accommodating 144 beds could not be carried out, as we have already mentioned for less than 56,000*l.*" The committee tried to discover some plan that would need a smaller sum, but the character of the work already done made one impossible. The walls are very thick; Pyrmont stone is used for the two storeys that have been built, and the use of brick for the rest of the walling would produce a hybrid structure that would not be suitable for so important a street as Macquarie Street. The Parliamentary Committee are therefore compelled to declare, "though the evidence shows forcibly that the plans have been prepared on a scale much more elaborate and expensive than is necessary, and that the expenditure already incurred, if not reckless, indicates a want of ordinary carefulness, the erection of the buildings having been carried to a certain point, the only manner in which any future expense may be saved is by reducing the height to which the buildings should be raised." The committee therefore recommended that the Sydney Hospital should be completed according to the modified plan at a cost of 56,000*l.*, an amendment to the effect that the outlay should be 80,000*l.* having been rejected. It was also recommended if any further revision should be necessary, the plans were to be submitted to the Government architect.

It must not be supposed, however, that all the evidence was in favour of that conclusion. Mr. O. H. Lewis, who is the senior architect in Sydney, recommended, in spite of all the money laid out, that the part of the buildings erected should be taken down and reconstructed on a different plan. Mr. Kirkpatrick, who was no doubt a competitor, and whose design was recommended for adoption by a sub-committee, said he was fully convinced that the hospital would not be a success, and recommended that the part commenced should be turned into a technological museum and art gallery, or, better still, as he said, "make the first loss a bad loss, and pull the building all down and clear it away." Mr. Dean, one of the directors of the hospital, who is a builder, said he considered the completion, according to the plans, could not be carried out for 80,000*l.*, or for less than 100,000*l.* It appears the 80,000*l.* has been arrived at without the aid of a specification. Mr. Horbury Hunt, although willing to have the hospital completed, admitted "that the design is defective and faulty, and not up to the requirements of present scientific knowledge." Dr. Bowker, when asked whether he recommended the completion or demolition of the hospital, replied, "My

notion is that it should be used for some other purpose if possible, or if it could not be utilised for any other purpose should be pulled down."

The case is one of those which make so many people lose confidence in architects, because it is supposed that clients' interests are sacrificed for the sake of the commission. The architect of the hospital was asked by one of the committee, "I want to know why you sent in plans of a building to cost 100,000*l.* when you were asked to prepare plans which would cost 45,000*l.* Why did you not tell the committee the cost?" The answer was, "If I had told them that I should simply have had to stand aside." And afterwards he said, "The committee were deceiving themselves. I did not think it proper to stand aside, so I competed under the conditions and sent in a builder's certificate, which I think was rather a humiliating thing to have to do, to the effect that the buildings could be put up in a certain way for the amount stipulated." There are many architects in England and elsewhere who will admire the diplomatic skill with which Mr. Rowe was able to dodge all those who were concerned in obtaining funds for the building. As far back as September 1879 the minute book records that "the architect stated that as soon as he has completed the plans to submit to Government he will be in a position to give an estimate of the cost of the building." And that position continued to be held without any estimate appearing, until the funds were exhausted. It may be a sign of ability to keep clients in the dark for a long period; but sooner or later there is a revelation and the architect must suffer. We regret to see from the evidence of Mr. Horbury Hunt, the president of the Institute of Architects of New South Wales, that the practice is becoming too general in that part of the world. When asked whether it was usual to send in plans which could not be carried out for the amount, he replied, "It is a disgraceful practice and becoming a common one." "Is it done," he was asked, "by a respectable class of architects?" and the answer was, "There is a certain class of men who, by persistent pushing, eventually get to be considered very clever men, and then there are some directors and members of the competitive committees who delight in this vicious system. I look upon the system as pitting one man against another to see who can tell the biggest lie on paper." In reply to the question, "How many architects are there in Sydney who would not lend themselves to this kind of thing?" Mr. Hunt said, "Perhaps half a dozen out of fifty are strictly non-competing architects."

To this depth has the practice of architecture fallen. Is it any wonder that, after hearing so much about modern practice, one member of the Parliamentary Committee should describe competitors as clever blacklegs, or that, as Mr. Hunt said, "The secretaries of these competitive committees treat our men as if we were pick-ups from the street?"

JAPANESE ARTISTS.

In a letter to the *Times* Mr. Ernest Hart writes as follows:—I spent lately many deeply-interesting weeks in the society of the artists, art-workmen and art-patrons of Japan in Tokio, Kioto, Osaka, Nikko and Nara. I rejoiced in your tribute to the memory of Shibata Zeshin, a great artist, as you say, in lac and in water-colour painting. Of his works I frequently received specimens, which are now in my collection, some of which I shall be happy to hand over to South Kensington. They are almost equal to those of his great predecessor, Ritsuo. Shibata Zeshin died in the darkness of a blind old age and in straitened circumstances. Allow me a little space to explain how largely Europe must share the responsibility of this state of things with his own countrymen.

Zeshin was one of the last of the "old school" of Japanese artists, and suffered with them from the uprooting of the old order of things and the substitution of Western "civilisation" and commercialism. In old Japan the artist-workman was a feudal retainer. He ranked socially far above the merchant or trader, who was a heimin—that is to say, of the fifth class in society, and who could carry no sword nor receive any title of honour.

I have before me as I write pictures, sword-guards, illustrations and even "No" masks, signed with the honorary titles of "Hogen" (baronet) and "Kami" (prince). Two of the ceremonial masks in my collection are signed Kami No Wakasa (Prince of the province of Wakasa). The favourite and affectionate title by which Motonobu, the famous painter of kakemonos in the seventeenth century, is still known is Ko-Hogen, the baronet of olden time, the chief and most honoured therefore of baronets. Ritsuo was the favourite companion of the Daimio of Tsuguru, and I have before me a noble work, a great "tsuba" (sword-guard) in lacquer, which he presented to his prince as a memento of their frequent fencing bouts, and which the latter offered as a votive gift to the temple.

Nowhere in the world did artists, poets and art-workmen occupy a higher or more honoured position than in Japan until some forty years ago, when we forced upon them, in conjunction with the Americans, treaties of commerce by the aid of war-ships, bombarded their cities, and exacted heavy indemnities for every hostile manifestation of their aristocratic dislike to mercantilism. We finally succeeded in so impressing them with our superiority of arms, laws, science and power that feudalism went by the board, the feudal provincial chiefs were disarmed and expropriated, and Board Schools, the new police, a Germanised army and Anglicised ironclads superseded the old samurai (two-sworded men) and the feudal system.

Four millions of samurai were thrown out into the world to earn their living, some as farmers, some as shopkeepers, some as jenricksha men (jarvies). The artists and artist workmen shared their fate, and it went hard with the latter. In Japan there is no abstract art; it is wholly decorative, the art of Benvenuto Cellini, of Giotto, of the Raphael of the Vatican Loggie. Their occupation was gone; the Daimios were impoverished, and for the swords, the tsubas (sword-guards), the inros (medicine-boxes), the chaire (bowls used for the tea ceremony), the lacquer-boxes and despatch-boxes—favoured products of the ancient art—there was no longer any demand. Habits were changed, requirements altered, the local castle enclosures in which the artists lived, and the provincial courts at which their art was fostered, were swept away. They had to look to Europe and to the merchants. Here they came into contact with a new order of requirement. Mechanical reproductions of cheap objects made in vast numbers and sold to pattern became the chief demand of the European markets.

There are in Western countries some connoisseurs who will pay handsome prices for works of ancient Japanese art, but there are few people in this country who do not think that everything which is new in Japanese art should be exceedingly low-priced. The consequence is that, with certain exceptions, the older school of artists have languished and starved.

Some of the new men have adapted themselves to the new order of things—men such as Namakawa, of Kioto, his namesake of Tokio, and Honda, of Nagoyo—are producing splendid specimens of fine cloisonné enamels, but they even are handicapped by the facility with which common imitations of their work are multiplied for the English market, and find a far readier sale to the undiscriminating masses because they are cheaper. So also with the porcelain of Seyfou, of Kioto, Inouye and Takemoto, of Tokio, Makuza, of Yokohama and others.

There are still great art-workers in Japan, but little of their best work comes to this country—it is bought chiefly in Paris and in America, where high prices are willingly paid for fine work, even though it be modern Japanese.

So great is the craze for cheapness in modern Japanese art-work, and the willingness to pay much higher prices for reported "old" work, that I found a large number of the best art-workers employed in fabricating pieces to which the appearance of age was skilfully given. Of many thousands of so-called "old" Japanese works of art which passed under my notice at the shops of the dealers in the great towns, at least 90 per cent. were fabrications of this sort, made to meet the demands of the many thousands of globe-trotters who now annually travel through Japan with eyes that cannot discriminate, and all demanding "old curios" which are manufactured for them by the thousand. The only other great demand for art-wares (so-called) is for the wholesale dealers of Yokohama and Kobe, who supply the warehousemen of London and other great cities, and these demand chiefly objects which they can sell by the casefull and in "large lines" to the retail curio-shops, the linendrapers and the grocers.

Thus have a variety of causes, to which "European influence" is no stranger, done much to debase and travesty current Japanese art and rendered hard the lot of the old artist and art-worker.

But under the influence of the Emperor and his household, and with the assistance of such men as Viscount Kuki and Mr. Okakura, better days are being prepared. At Uyeno Park, in the great art schools and technical institute, the remnant of the old art-workers of Japan are being gathered together. The son and some of the best pupils of Zeshin are there; so is Natsuo, the last of the great metal-workers of old, a descendant of the Gotos, and one of the Miochins. They are working in the service of the Emperor and under his patronage. Some large commissions have been accepted, one lately for the production of an equestrian statue, intended as a present to the Emperor from one of his wealthiest subjects.

Amongst a people so permeated with the love of art and so devoted to the admiration of all its manifestations, neglect of its professors can only be a temporary and transient phenomenon incidental to a period of revolution. When Englishmen learn to understand and to admire what is really fine and mature in workmanship, material and method in modern Japanese art work, and to cease to look for it among the bargains of the cheap linendraper, we may begin to atone for what we have done to degrade and darken the lot of the art-worker of the far East. It would be very helpful, both to our own growth in knowledge and taste and to the restoration of art in Japan, if the collections of our national museums were more complete and typical of the best work of earlier and modern Japanese. At present they are very incomplete and misleading.

GREYFRIARS CHURCH, ABERDEEN.

AT the last meeting of the Aberdeen Ecclesiological Society the Rev. Mr. Cooper proposed—"That this Society, having regard to the great historical and ecclesiological interest of Greyfriars Church, Aberdeen, and the ease with which a worthy restoration of the building, either as a parish church or as a college chapel and graduation hall, could be effected, protests against the proposal to demolish or remove it; calls upon the people of Aberdeen and all interested in the ancient buildings and ecclesiastical art of our country, to assist in its preservation; and respectfully asks the University Court of the University of Aberdeen to receive a representation on the subject." Mr. Cooper pointed out that the Society uses its influence for the conservation of buildings of ecclesiastical interest or artistic value; and they should be as salt that had lost its savour were they to shrink from or neglect this duty. He was sure he spoke for them all when he disclaimed any wish to embarrass either the university authorities or the Town Council in the efforts they were making at great sacrifice for extension of university accommodation. The Society recognised fully the pressing need for enlarged accommodation, but they believed that ample room could be obtained without the destruction of Greyfriars Church, and they should regret its demolition as at once a barbarism and a calamity. Mr. Cooper then proceeded to argue under various points in support of his resolution. First, Greyfriars was the most important of the very few fragments of Mediæval work which remained in New Aberdeen. Second, but Greyfriars Church was not merely a venerable relic. He begged to call special attention to the fact that it was an important "document" in the history of Scottish architecture. Students of the history of painting knew the historical as distinguished from the artistic value of "signed work" by an old master. Greyfriars Church was a "signed work" in architecture. They knew it was built "from its foundation" between 1518 and 1532. They knew the name of the architect who planned it—Alexander Galloway, parson of Kinkell—as well as of the munificent patron for whom he erected it—Bishop Gavin Dunbar. There were very few Gothic buildings in Scotland of which they could say the same. The difficulty of tracing chronologically the course of Scottish Mediæval architecture was very great, and it would be a terrible loss from a historical and scientific point of view if this "document" were erased or falsified. Third, it was of national design and workmanship. It was planned by a Scotsman—a north countryman—and built by Scotsmen. They could trace in the later work at Melrose and at Stirling the influence of the English Perpendicular; the influences of the French Flamboyant were not less evident at Linlithgow; while in regard to King's College Chapel, Aberdeen, their learned principal had justly drawn attention to the Flemish character of its details; but no contamination from any of these sources had affected the design of Greyfriars. Fourth, a further plea ought to have weight with the University Court. The architect—Alexander Galloway—was one of the chief of the early benefactors of the University of Aberdeen. Thrice over—in 1516, 1530 and 1549—he held the office of rector of the university. As rector he made the first recorded visitation of King's College. They would find the account of it at full length in the "Fasti." His donations, alike to chapel, hall and library were numerous and splendid. The very scarlet robe which the present Lord Rector wore was successor of one which he presented. In fact, to no one after the two great bishops—Elphinstone and Dunbar—did the university in its early stages owe so much as it did to the reverend architect of Greyfriars. The friars in their obituary notice were warm in the praise of their benefactor. Would the university so far forget him as to erase the last example of his work in Aberdeen, in order to erect in its place a modern structure of not half its artistic value? He would not attribute to them such ingratitude, but it was well to remember that gratitude was sometimes prudence, and that institutions which depended on benefactions ought to show that they did not forget their benefactors. Fifth, Mr. Cooper went on to say that, from a purely artistic point of view, the ancient parts of Greyfriars had high artistic value. Simple yet handsome, the design stood out in marked contrast to English buildings of the same period, which were generally overladen with ornaments at once uninteresting and needlessly repeated. On the other hand, it had none of the uncouthness which disappointed them in most contemporary Scottish work, for example, in the windows on the north side of King's College Chapel. He did not hesitate to say that Greyfriars was architecturally the finer work of the two. It was more symmetrical and more dignified. Nor did its regularity exclude invention. Nothing could be finer than the treatment of the great window in the south gable, where the basket tracery of the side windows reappeared, but so much modified that the seven lights seemed to group themselves into three divisions of three lights each—a fine suggestion of the Trinity in Unity. The window was probably unique in Scotland, and it had always been much admired by the discerning. He remembered, when he was a student, old John Ramsay told him it was the finest thing in Aberdeen, and now that the old houses in the Longacre which obscured it externally had been removed, it could be seen both inside and outside. After describing the frightful things that were done to the church in the last century, Mr. Cooper pointed out how Greyfriars could, with as much certainty as ease, be restored almost to its pristine beauty. He then spoke of its associations with the stirring times of the Covenant, and proceeded to ask why it was that a building of such merit and interest should be in imminent danger of destruction. Its beauties, after a woeful marring, had been buried, and the deformities, which were not part of the original building, alone exposed. That misfortune had left it without friends, save the comparatively few who took the trouble to look at its hidden and more worthy side, and had the knowledge to discern the capabilities it still possessed. The university was in clamant need of enlarged accommodation, and the site of Greyfriars Church, though not by any means the only ground that could be got, was the nearest and the handiest. Absurd, however, was it not, that the objection which chiefly ruled in the Town Council and decided them against those plans which showed the retention of the church, and in favour of an entirely new façade, was simply the idea that its grey old sandstone would not harmonise with the dazzling granite of the new building. On the same principle the West Church, the latest work of their great townsman, Gibbs, should be demolished next because it did not harmonise with the whiteness of the East Kirk and the spire. Surely an ancient seat of learning like Marischal College ought to have one ancient building to witness its three centuries' pedigree. He would add that, of the many needs of Marischal College, there was none more urgent than a chapel for the medical students. It was not right that so many young men, gathered there from all parts of the Empire, should have absolutely no provision made by those who for the time being were their guardians for their spiritual needs. Greyfriars would make a perfect college chapel. Nor could he believe that arrangements for its use for that purpose were impossible. Either as a college chapel or as the parish church of Greyfriars it should certainly remain. The proposal—which seemed to find much favour in unexpected quarters—to take the church down and reproduce some of its features in a new church, was open to many objections. It would deprive them of their antiquity with all its associations, and of their architectural "document." Even if there was an undertaking to remove Greyfriars stone by stone and re-erect it on a different site, they ought to reject it. The sad example of Trinity College, Edinburgh, ought to be enough. Some time ago a friend of his called on a Fifeshire minister, and was asked to come and see a Druidical circle. They went, and there were the stones beautifully arranged in a ring in a corner of the manse policies. "Dear me," said the visitor, "I had no idea you had an antiquity like this so near your manse." "Oh," was the reply, "it was not here. The circle was up on the hillside yonder, but I had the stones carried here for convenience sake." In conclusion, Mr. Cooper added a word in favour of the retention of Byron's house. Though not ecclesiologically in itself interesting, the memory of that great poet was a splendid association, worth infinitely more for those educational purposes a university was intended to promote than all the grandeurs which masons' hands were likely to create in Aberdeen.

Mr. Patrick Cooper, secretary, seconded the resolution, and in doing so mentioned that in a letter of apology for absence from Mr. Henderson, that gentleman wrote that he was strongly of the opinion that every possible effort should be used to prevent the fabric of Greyfriars Church from being interfered with, and that at all events, so long as he was a member of Presbytery, he would resist all proposals to demolish it.

It was stated by the Chairman that Mr. George Reid and Mr. N. Comper had written in a similar strain.

In the course of conversation which took place on the subject, the opinion was expressed that the public had not been hitherto aware of the destruction involved in the demolition of Greyfriars Church.

The motion was thereafter unanimously agreed to, and the president and secretary appointed a deputation to wait on and make a representation on the subject to the University Court.

TESSERÆ.

Reynolds as a Connoisseur.

THE best artists are not always the least fallible judges in their own art, of which Sir Joshua Reynolds was a remarkable instance. No unfledged peer or full-plumed loan-jobber was more liable to be deceived, even in those branches of the art which he professed most to admire—false Correggios, false Titians and false Michel Angelos swarming in his collection which he certainly believed to be true, for he was a man of correct moral feelings as well as elegant manners and enlarged understanding, and, so far from being capable of acting the dupe for the purpose of duping others, he both courted and practised the most open freedom of criticism on all occasions, and would no more have connived at the sale of a counterfeit picture than at the issuing of a counterfeit bank-note.

The Italian Style.

The Italian style may claim the preference over all others in virtue of its length of possession. A modern Gothic building, however unique a combination of elements it may boast, always looks like a reproduction of a Mediæval one ; while an Anglo-Italian example, though of as recent a date as the other, and without one original feature, has an air of genuine and entire modernness. Why is this? It is because the style of the former work, discontinued years ago, was only resumed within our own recollection, and because its original examples are amongst us to remind us of the gap between their date and that of the nineteenth-century representatives ; whereas the style of the latter, however it originated, was in operation centuries before our time, and its example of to-day is therefore, as it were, one of an apparently interminable series, coming down from the past and leading on to the future, to which it more significantly and eloquently appeals, and to which it has as much reference as to the past.

The Interior of St. Albans Abbey.

The shrine which contained the remains of the proto-martyr was emphatically the central point of all the manifold decorations with which the interior of St. Albans was once resplendent. Besides the painted decorations which covered pier and arch and wall and ceiling, there were a vast number of precious works of art connected with the numerous altars that were scattered all over the building. Of all these it is impossible now even for the most lively imagination, coupled with the soundest archæological knowledge, to form anything like a faithful picture, but we are not without some valuable records of some of the most important of them. Among these we have the shrine of St. Amphibalus, the Christian priest, who took refuge at the house of St. Alban. Mathew of Paris says that in 1186 the relics of this saint were transferred from the coffer in which they were first placed by Abbot Simon some fifteen years before, "into a new shrine prepared for this purpose, splendidly adorned with gold and silver of unrivalled workmanship . . . which wonderful shrine a certain middle partition divides interiorly, and in that part, whose front on the inside exhibits the passion of the saint, are reserved the relics of the martyr and of three of his companions; but in the remaining part the relics of his six other companions are reserved. In the coffer which before contained the said relics a small portion of the same remained, together with a considerable number of venerable bodies, and that coffer, with another like it, was placed in the presbytery upon the wall, at the right side of the high altar. In the second coffer are placed the dust found with the bones." Between 1195 and 1214, "by the industry of Master Raymond, the prior, and Brother Roger de Park, the cellarer, a great frontal was made (of which part is of metal and part of wood, most elaborately finished), which is before the high altar in our church ; also two texts of silver gilt, on one of which a crucifix and Mary and John are figured, and on the other the Majesty, with the four Evangelists, is engraven in elegant chasings by the mechanical skill and diligence of the monk Walter de Colchester, whose brother William painted a tabula for the front of the altar of the Blessed Virgin, with a super-altar carved, and a cross placed upon it; as also the frontals before the altars of St. John, St. Stephen, St. Amphibalus and St. Benedict." His brother and disciple, Master Simon the painter, wrought the frontals of St. Peter and St. Michael. The upper and lower frontals of the altar of St. Thomas were painted by Simon, assisted by his son, the monk Richard. To this family of artists, two of whom were monks, the monastery was indebted for the frontals of the altar of St. Benedict, and many other carvings and paintings. Another of Walter de Colchester's great works was the rood loft erected between 1214 and 1235. The chronicler says that this "incomparable painter and sculptor erected a loft in the middle of the church, with its great rood and Mary and John and other carvings and handsome decorations. Then the Abbot, William de Trumpington, solemnly translated the shrine containing the relics of St. Amphibalus and his companions from the place where it formerly stood, namely, near the high altar and shrine of St. Alban towards the north to a place in the middle of the church which is enclosed by an iron railing and grate, the altar which stood there being most handsomely constructed, and the frontal and super-frontal richly painted; and he caused the altar to be solemnly rededicated in honour of the Holy Cross and in honour of the saints whose relics were deposited near it, at the same time consecrating the great rood with its images, which stood over above this altar. The same abbot constructed certain framework round the high altar, on the top of which is represented the history of St. Alban, which most splendid work Master Walter de Colchester effected, not without very laborious study and diligent application, the Abbot generously bestowing ample means." To go back again to Abbot Simon, 1168–83, we find mention made of the "painted 'almery which is in the church against the tomb of Roger the Hermit," made expressly for the purpose of keeping the best books of the Scriptures, that any lover of the Scriptures might refer to them. As to images and figures, they must have been very plentiful in St. Albans. Mathew of Paris, artist friend of Walter de Colchester, who he seems never tired of praising, carved a most elegant image of the Blessed Virgin, the old image it replaced being preserved and set up over the altar of the Blessed Mary. At the same time the Abbot, it seems, carried out a number of other changes, including the removal of a certain beam from its place over the high altar to a place in the southern part of the church near the new image of the Virgin, on which beam he had figured the twelve patriarchs and the twelve apostles, and in the midst the Majesty with the church and synagogue.

Early London Conduits.

According to Stow, "The said river of Wells, the running water of Wallbrook, the bournes aforenamed and others the fresh waters that were in and about this City, being in process of time, by encroachment for buildings and otherwise, utterly decayed, and the number of citizens mightily increased, they were forced to seek sweet waters abroad, whereof some" springs, "at the request of King Henry III., in the twenty-first year of his reign, were, for the profit of the City and good of the whole realme thither repairing, granted to the citizens and their successors by one Gilbert de Sanford, with liberty to convey water from the towne of Teiborne by pipes of lead into their City." The Tybourne rivulet ran through Tothill Fields to Scholar's Pond, and thence into the Thames ; it is now a common sewer. The grant was made in 1236 ; the work was commenced in 1285 ; the waters from Tybourne were conveyed by a 6-inch leaden pipe to Charing Cross, and from thence to several conduits in the City, the first and greatest of which was erected at the Cross in Cheapside, at the end of Wood Street, in 1285, the distance being about 3½ miles, and for the first time water was conveyed by pipes into the City. In 1401 the prison-house called the "Tun, on Cornhill," was converted into a cistern for the Tybourne water, and was afterwards called the Conduit on Cornhill. In 1423 water was brought from Tybourne to Billingsgate, Paul's Wharf, and to a cistern in the wall of St. Giles's Church, Cripplegate. In 1430 the conduits reached the Standard in Cheapside, near Honey Lane. In 1432 water was conveyed to the gaols of Newgate and Ludgate, and in 1438 was brought from Tybourne to conduits in Fleet Street and Aldermanbury, and from Highbury to a conduit opposite Cripplegate Church. The abbot of Westminster granted the City in 1439 one head of water, containing about 800 square yards, or the sixth of an acre, together with all its springs in the manor of Paddington, provided the intended work did not draw the water from the ancient wells in the manor of Hida, showing by this proviso that four hundred years back it was discovered that any great draught from one well would be likely to leave the other neighbouring wells dry. This grant was confirmed by Henry VI. in 1441, and other advantages were granted by a writ of Privy Council to enable the citizens to bring water by means of leaden pipes under the ground for "above three miles" to a conduit in Cheapside, which was erected in place of the old one at the Cross, which Cross was also re-edified at the same time, and this conduit was used as a reservoir for the supply of other conduits. The water was conveyed from the springs to cisterns at Tybourne, from thence to Charing Cross and thence to the City. In 1443 a new conduit was erected near St. Paul's Gate, at the upper end of Cheapside. In the Old Bailey, a little lower than the Sessions House, was a large cistern with divers cocks, which received the waste water from the prison of Ludgate for the use of the neighbouring inhabitants. A fresh supply of water was brought by leaden pipes from Tybourne in 1471 to a conduit erected in Fleet Street, at the end of Shoe Lane, and to other conduits for the benefit of the people, viz. "for the poor to drink, the rich to dress their

meat." In 1478 a cistern was added to this conduit to hold the waste water, and another at Fleet Bridge. In 1491 a conduit was erected in Grasse (or Gracechurch) Street. In 1498 a conduit was erected at Oldbourne Cross, and was again new made in 1577 by William Lamb, citizen, who, having drawn together several springs of water into a head at the upper end of Red Lion Street, which was called Lamb's Conduit, conveyed the same to a conduit on Snow Hill by a leaden pipe 2,000 yards long. A stone conduit was erected in 1509 in the Stocks Market which stood at the north corner of Walbrook. About the year 1513 a conduit was erected in Bishopsgate Street, and in 1528 one was erected at London Wall. In 1535 water was brought from Hackney to a conduit erected in Aldgate. In 1543, notwithstanding the vast expense the citizens had been at in bringing water to, and erecting conduits in the City, the supply was very inefficient, and an Act was passed in the thirty-first of Henry VIII., empowering them to bring water from Hampstead Heath, St. Marylebone, Hackney and Muswell Hill, upon their compensating the owners of land for damage done by digging or otherwise. In 1546 water was conveyed in great abundance from divers springs lying between Hoxton and Islington to a handsome conduit erected at the west end of St. Margaret's Church, Lothbury. The Charterhouse was supplied from White Conduit Fields; Christ's Hospital from the Devil's Conduit, north-east of Brunswick Square. Stow mentions amongst the remarkables in the City of London a well at Aldgate curbed with a stone of great depth, and rising into a house two storeys from the ground, which is peculiar, "for I have not seen the like in all this City to be raised so high." There were other conduits of less note than those now enumerated and wells with buckets or pumps in Threadneedle Street, Leadenhall Street, &c. Sir John Evelyn writes that about the accession of Queen Elizabeth, in 1558, the waters of Dame-Annis-the-Clear Spring at Hoxton were carted to the breweries in London at an expense of 800*l.* per annum, and about the same time wells were dug and pumps erected in every corner of the City and suburbs.

Bronze Castings.

There is no section of industrial art, not even that of furniture, with its applications of carving, wherein the influence of fine art upon manufacture, and it may also be said the reciprocal influence of manufacture upon fine art, is more direct and perceptible than in works in bronze; indeed, the greater number of such works (those classed as *bronzes d'art*) are really works of fine art reproduced in large numbers for general sale, and coming under the name of manufactures only from this multitudinous reproduction. The skill that is required in the workman must approach that of the original artist, at least in technical execution, and in the power of fully comprehending the details of his form and the intention of his labours. It is to be recollected that in almost all cases the whole surface of the metal after it leaves the sand is submitted to the chisel of the chaser, and that even in the mode adopted by Barye to remedy this evil many joints have to be made, and their intersections and the numerous founts to be cleared away, leaving but small real difference in the skill required at the workman's hand, however much more of the artist's own treatment of surface may be thus retained. Thus it happens that in preparing these fine-art bronzes for sale, a large amount of intelligent finish is demanded, of which finish, in works of art manufacture as in works of art, there are various kinds and degrees. There is, for instance, first, the finish of the artist himself who originates the work, which, whatever the amount, is just so much as he considers conducive to its right and full expression. In the eyes of others this may or may not be sufficient, but who shall add to it judiciously, add to it, and not remove some of its individual characteristics. Many would think the works of Michel Angelo very unfinished, yet could a touch be given to them which would not injure their completeness, since every touch has been a thought, every mark of the chisel cut with understanding and judgment.

Unity of Style.

There must be some predominating influence, some prevailing sentiment present in the minds of men to produce a style. Did this influence really exist, it would be seen in all a man possessed, and unity of character in his house and all the furniture and chattels it contains would be the necessary result. In the Mediæval times this predominating sentiment was the respect of the many to religion; thus the aspect of all a man possessed was ecclesiastical, his furniture carved with emblems of the Church, and his walls covered with the choice precepts of religion. The principle of unity or congruity, however observable in the Mediæval period, was never attended to by the great artists of the Renaissance, and we continually see in their works and in their additions to other works, the strangest inconsistencies and anomalies. These revivalists, coming with all the ardent enthusiasm of converts from the study of Classic art, and convinced in their own minds of its ideal perfection and beauty, found the land covered with vast and magnificent temples and structures, deep in the love and reverence of what they deemed the vulgar public, and venerable from age and from consecration, yet of a style and character wholly opposed to that they sought to introduce. The reconstruction of these time-honoured edifices was hopeless, and the new race of architects began to seize upon and adorn the interiors of the old cathedrals and churches of Europe with rood-screens, stalls, altars, confessionals, pulpits and monuments, in the new style of the Renaissance, quite irrespective of the character of the original structure. In process of time they even ventured to make additions to the very structure itself. Thus, in our own country, Inigo Jones, not foreseeing the fiery purgation that was to prepare the way for the great monument of the new art, did not hesitate to build a Classic portico to the Gothic structure of Old St. Paul's; and it is impossible to enter the churches and cathedrals of France and Belgium and overlook how continuous was the endeavour to seduce the people gradually into the new faith in art, by additions such as those spoken of above. The apostles of the new faith did, in fact, but follow the practice and example of the early missionaries of Roman Christianity. These sought to humour the superstitions of the Pagan worshippers, and to wile them into truth by adopting, not only their festivals and holidays, but their temples and altars, consecrating them to the new faith, and at the same time smoothing down those distinctive differences that were most repugnant to their old belief.

Ornament and Material.

The homogeneity of grain in stone, and its perfect freedom under the tool, admirably adapt it for carving, but necessitate a different treatment to that for the continuous fibre of wood. The latter will bear more finesse of execution than the former, and a more detached relief; the colour, as light or dark, or veined and mottled, the hardness or softness, the intractability or freedom of the grain in wood, moreover, require peculiar renderings of the ornament; while metal, whether the ornament be cast, chased or embossed, evidently demands a totally different treatment to either. Again, the position of the ornament requires special consideration, as, for instance, its height above the ground, or point of view, which will govern both its relief and execution; much more varied quantities, bolder relief and coarser execution being not only allowable but absolutely necessary at great heights above the eye. The practice of cutting the ornament after the stone has been placed in the structure, so universal with the best Gothic carvers in Mediæval times, and still practised by the French workmen, admits of a right estimate of the true relief and just quantity of ornament; but from this very circumstance (its relation to situation) the mere reproduction of such ornament is often very unsatisfactory, for it must be remembered that the fitness of ornament for its special situation, and for the peculiar material in which it was to be wrought, was a necessity in its first production, but is overlooked in its mere imitative repetition. If then the translation of ornament, even from one position to another, requires that it should be greatly modified and changed, still more so is this the case when the material in which it is to be wrought is changed also. The heavy scrollwork of a Roman frieze carved in stone, although appropriate in its place far above the eye, must be quite unsuitable carved in wood as the back of a sideboard, and still more so cast in iron as part of a gate or a balcony, where it is not only close to the eye, but pierced through between the foliage, which in the original was backed out and supported by the ground from which it was carved.

Galleries and Museums.

Europe does not maintain sufficiently the distinction between a gallery and a museum of art. The latter, as in the Louvre, should contain everything good or bad which illustrates its history. The former should be confined to choice specimens of the best masters in their different styles and of all ages, so that the spectator should see nothing but what is excellent in subject and treatment. A few good pictures are far more effective than a myriad collected solely in reference to number. There are upwards of 1,000 in the Dresden Gallery. Two hundred culled from this mass would constitute a far more interesting and instructive gallery. The mind then would not be distracted and lose half its time in simply refuting, or, perhaps, misled by trash, overlook those of importance. It may be assumed that art would actually be benefited if one-half the gallery pictures were burnt; but as that would favour of vandalism, it would be better to put aside the inferior into museums open to those who wish to study the progress and spirit of art in different generations or masters, reserving for public eye only those that instruct or exalt popular taste. A few, also, have a better opportunity for being rightly placed, and therefore appreciated according to the intent of the artist, than when there are a great number. No gallery in Europe attracts more attention and gives more satisfaction than the Pitti, at Florence, yet in numbers it is one of the smallest. So of the Lichtenstein Gallery at Vienna, which never exhausts; but the body and mind weary over the interminable ranges of the Louvre.

NOTES AND COMMENTS.

A case of great importance to the building trade and others who make use of Belgian girders has been determined on appeal in the Edinburgh Courts. A firm of builders in Glasgow entered into a contract with Messrs. P. & W. Maclellan, the well-known iron merchants of that city, to supply beams and girders for new tenement buildings. One of the conditions was that the girders were to be delivered "at such times as may be required by the mason." There was some difference of opinion as to the meaning of the words, but when the case was first tried it was held that what was intended was that the rate of delivery was to be regulated by the needs of the masons, in order that the works might not be blocked up by the girders, which would be the case if all were supplied at one delivery by Messrs. Maclellan. The girders were obtained from Belgium; some arrived in good time, but owing to strikes and other causes the supply was retarded. Afterwards it became necessary to take an action for the recovery of the balance of 244*l.* due on the account, whereupon the builders took a counter action for damages on account of the delay. The sheriff who tried the case held that Messrs. Maclellan had proved that it was a custom in the trade that the buyer in such cases took the risk of delay from strikes and other unforeseen causes beyond the seller's control, and in both actions judgment was given in favour of Messrs. Maclellan with costs. The builders appealed. The judgment of the Courts below was affirmed on the ground that Messrs. Maclellan had exercised due care in placing the order for the iron with a proper and suitable manufacturer in Belgium; that they were not responsible for the delay which occurred, not having been able to anticipate its causes; that they were therefore not chargeable with breach of contract in unduly delaying delivery. It will be observed that in the judgment of their lordships the custom of the trade is not recognised, and that the issue was made to depend on the facts stated in evidence.

There are temptations enough around French artists to lead them into representing the nude in painting and sculpture, but an additional one henceforth awaits them. A couple of years ago M. Piot, a collector who was fascinated with the *putti* and *amorini* of the Italian masters, bequeathed a sum of money to the Académie des Beaux-Arts which was to be employed in founding a prize to reward the painter or sculptor who produced the best representation of a nude infant, whose age was not to be less than eight months or more than fifteen. It was arranged that the prizes were to be awarded after competitions. But it has been decided that the picture or statue which is considered worthy of the Piot prize is to be selected by members of the Académie in one of the annual exhibitions. It was supposed that the prize was intended for young artists, but for the future there is to be no restriction on account of age. Foreigners are also eligible for the prize. Visitors to the various Paris exhibitions may therefore expect to see naked babies on all the walls, and, like Charles Lamb, they must in consequence think kindly of "the much-calumniated King Herod."

The cities of Manchester, Liverpool, Glasgow and Dublin are often cited as examples which the County Council of London would do well to follow in dealing with the most important problem of water supply. Another case worth imitation is that of Leeds. Fifty years ago the town was supplied with water by a company. It was obtained from streams in the neighbourhood of Eccup and Alwoodley. In 1852 the company were empowered to take water from the river Wharfe, near Harewood Bridge, and it was about this time that the undertaking was transferred to the Corporation for the sum of 225,730*l.* Extensions of existing works were sanctioned from time to time, until, in 1867, it was felt that Leeds required both purer water and a larger supply. The Corporation were therefore, in that year, authorised to take water by gravitation from the river Washburn, a tributary of the river Wharfe, and the following magnificent reservoirs were constructed:—Lindley Wood, with an area of 117 acres and a holding capacity of 750,000,000 gallons, at a cost of 199,221*l.*; Swinsty, with 156 acres and a holding capacity of 960,000,000 gallons, at a cost of 162,707*l.*; and Fewston, with 156 acres and a holding capacity of 866,000,000 gallons, at a cost of 151,379*l.*, making in all a total area of 429 acres, 2,576 million gallons holding capacity, and a total cost of 513,307*l.* In 1877 the Eccup reservoir was enlarged, and it now has an area of 195 acres, with a capacity to hold 1,331 million gallons. Altogether the capital cost of the Leeds Waterworks represents a sum of 1,698,137*l.* On the other side of the account, it is found that when the waterworks were taken over by the Corporation, the gross income in 1853 was 14,172*l.*, the number of houses supplied being 25,000. The gross income on revenue account for the year 1891 was 101,744*l.*, the number of houses supplied 88,000, and the net profit for the year, after meeting expenses to the extent of 80,000*l.*, and setting aside 15,146*l.* for payment to sinking fund, was 6,588*l.*, as against 3,965*l.* in the previous year, or an increase of 2,623*l.*

The opening of the French Chambers is of late years sure to be marked by some resolution or report concerning the ruins on the Quai d'Orsay. As on former occasions, the duty of representing the ruins has fallen this year on M. Antonin Proust, whose name must be associated with them in the minds of all Parisians who undergo the pain of noticing parliamentary proceedings. He brought up a report recording the transactions of the past year, the abandonment of the sale of the ruins, and the reopening of negotiations with the Union des Arts Décoratifs. It would appear that history has been repeating itself, and that documents which were set aside several years ago could be utilised at the present time, the only alterations being a change of dates. After all that was said and done, nobody seems to be able to comprehend the present state of the affair. It appears to be agreed that the Union can possess the site and remains for a term of fifteen years, and can erect new buildings for the collections at an estimated cost of 3,171,000 frs., and that the Union will surrender its rights after the terms specified, when the property will belong to the French nation. But everything appears so clear there seems to be no obstacle to a commencement of the works, and yet it is impossible to say if they will be commenced. The whole history of the scheme is enveloped in mystery.

It will be remembered that a memorial was lately presented from some of the most influential trustees concerning the proposed extension of the Royal Manchester Infirmary. They said that, while of opinion that it was manifestly important the infirmary should be retained on its present site, any extension of the accommodation was undesirable. The Board of Management now say that they fully recognise the importance of not encroaching needlessly on the vacant ground belonging to them by enlarging the present infirmary. At the same time, when the fact is urgently pressed upon them by their medical advisers that fully to meet the increasing requirements of the hospital some additions on the present site are necessary, it becomes their duty, as the executive of the trustees, to submit to those trustees a plan for such increased accommodation as they deem requisite. On January 1 next the Board expect to receive from the selected architects plans for the additional accommodation proposed. Should the Board approve of any of the designs, they venture to hope the memorialists will give to such plans their impartial consideration when submitted to the judgment of the trustees, in fulfilment of the pledge given by the chairman at the annual meeting in July last.

That various trades are busy in Paris is plain from the increase in the *octroi* or duties which are levied at the boundary of the city. During the nine months of the present year there has been an increase in the duties of 2,493,028 francs over those received during the corresponding period of last year. Over one-fourth of the increase arises from building materials. Last year the duties amounted to 5,362,553 francs, while this year the duties on building materials already reach 6,111,502 francs, or 748,949 francs in excess of last year's receipts.

BRONZES AND ART CASTINGS.

A FEW weeks only have passed since Mr. George Wallis retired from the charge of the art collections in the South Kensington Museum. He was not destined to enjoy a long leisure, for his useful career came to an end on Saturday. Mr. Wallis was born in Wolverhampton in June 1811, and since 1841 he has been associated with the Governmental system of education in art. When he retired we referred to the reports which he prepared on some of the international exhibitions. As they are never likely to be reprinted the occasion is opportune to give some extracts from one on a special subject in which he was obliged to take much interest as head-master of the Birmingham School of Art. The report relates to Class 22 (bronzes, art castings, &c.) in the Paris Universal Exhibition of 1867. The parts now published are of permanent interest, and supply information that is not easily to be obtained :—

The metallic alloy called bronze varies slightly in its composition in various countries. In France, which is most undoubtedly the leading producer of this class of artistic and decorative works, the principal metals employed are "the copper of Chili, Russia, New Zealand and Minnesota, on Lake Superior, but the greater portion from Chili ; zinc from Silesia and the Vielle Montagne ; tin from Banca, Sumatra and Cornwall." M. Barbedienne, from whom this statement is quoted, also states that the zinc used in France for the purpose of casting figures, &c., to be afterwards wrought into imitations of bronze by the electro-deposit process and artificial colouring, is chiefly of the Vielle Montagne.

The conditions necessary for the development of this branch of industrial art appear to be a knowledge of the principles of artistic design and a love of art fairly spread through the people generally. The exceptional products exhibited by some countries, however excellent in themselves, are no evidence that the public sentiment existing in these countries at all approaches what we see at this day in France, and especially in Paris.

Partaking so largely of the highest artistic elements of design, the bronze manufacture may be considered a trade only by the extent to which it is or can be carried in the constant reproduction of the same subjects. Beyond its power of extension and the readiness with which the designs and models, together with the proper appliances for repetition, can be obtained in a properly-trained community, the manufacture of bronzes and high-class metal castings is in reality a fine art, and depends for its success upon its close approximation to, and continuous connection with, the art of sculpture in its best and most enduring forms. The marvellous reproductions of antique bronzes exhibited in the Italian section of the exhibition would go far to prove this, even if it were not patent to everyone that the education and training of the bronzist who is to be at all successful in his business must be essentially that of the artist, for however skilfully the model may be executed, or however perfect the casting produced from it, the fact that the finish must be that of the artist is self-evident.

The French bronzes may be broadly divided into two classes :—

1. Those which are designed and modelled as works of sculpture, and owe their interest and value to the higher qualities of fine art, in which statuesque severity of form, expression and dignity of treatment are combined to produce a given result in the material selected, without factitious aids from variation of colour, gilding or silvering, or combination with other materials.

2. Those which are essentially decorative in character, and which, whilst possessing many of the qualities of those named above, are yet so finished in detail and so varied in their effects of colour, gilding, silvering and enamelling as to make them ornamental and picturesque, rather than statuesque and severe.

Upon the capacity to produce works in the first class the power to achieve success in the second class must entirely depend. The art education of the bronzist in France is that of the sculptor, and the power thus cultivated is directed to the special manufacture or continuous repetition of designs. The growing demand has undoubtedly encouraged the development of this kind of art-skill until it has produced an important industry of great national importance, not only in this special direction, but also in the production of works in iron and zinc.

In 1844 I visited nearly every bronze foundry in Paris. It was easy to see that the skill manifested by the bronze casters and chasers would, at no very distant period, be directed to the manipulation of ornamental and decorative iron castings ; although at that period very little had been done in this direction, and the iron trade of France can scarcely be said to have had even an incipient existence. Personally, I regarded the position of the bronze manufacture at that period with a lively interest ; not so much in relation to itself as in its probable bearing upon the ornamental iron trade of England. In the present exhibition we see the very result which everyone would naturally expect after examining carefully into all the bearings of this question, in the exposition of ornamental iron castings in which the skill of the bronzist and the artist has been successfully combined with the best science of the ironfounder and trained metallurgist. Nor has the skill thus developed and carefully cultivated failed to react upon the practice of the bronzist. The efforts of the latter to overcome what, at first sight, appear insurmountable difficulties in casting art works in iron in one piece, from the fact that the system of "firing on" portions which in bronze can be cast separately cannot be applied to iron, has led to the adoption of a similar course of action in the casting of bronze figures and groups in one piece, thus eventually simplifying and cheapening the process. It is, therefore, perfectly in accordance with common sense and experience to assume that many important works in bronze of a complicated character produced on this occasion owe much of their success to the manipulative skill and experience gained by the moulder in the successful efforts to produce fine works in the inferior, or at least cheaper, metal, iron, from the fact that if produced at all they must be cast in one piece.

Fine Art Bronzes.

Taking the first-named class of bronzes into consideration, the principal works are represented by Victor Thiebaut. As works of fine art in bronze, Thiebaut's castings stand very high, and deserve careful examination. The most remarkable are a series of statues, life size, designed and modelled by several able sculptors, most of these being cast by Thiebaut. One is by De la Planche, a boy standing on the back of a tortoise with a bullrush poised above his head, as if using it as a whip. The spirit, expression and composition of this work are admirably adapted to the material in which it is produced. Another is entitled *The Winner of a Cock Fight*, a boy running with a pet cock held caressingly on one arm, modelled by A. Falguiere. *The Young Equilibrist*, as it is aptly named, is also an excellent work of the same class. It represents a boy spinning and balancing a plate on the point of a stick. This is designed and modelled by Blanchard. A boy with a tambourine, *The Saltarelle Dancer*, by Sanson, is another work of the same character ; whilst the bronze of *St. John the Baptist*, represented as a boy, preaching, designed and modelled by P. Dubois, differs from the works above quoted by its sternness, severity and ruggedness of character, not so much of treatment as expression.

All these works are excellent illustrations of artistic modelling and design, as adapted to this special material and mode of production. There is no trick in first making them apparently, if not really, difficult to mould and cast, and then overcoming these difficulties by methods skilfully provided for in the course of the modelling, thus frequently producing a constrained result in the arrangement of the group or pose of the figure. Everything has been kept simple in treatment, and there is a natural look about each figure which takes it out of the class of commonplace works in bronze or marble. No effort has been made to avoid "firing on" separate parts essential to the completion of the design, and when this is done it is with such consummate skill as to render it scarcely visible even to the trained eye accustomed to look at the right point for the usual evidence. This is especially the case with the advanced leg of *The Young Equilibrist*. The chasing and finishing of the surfaces at these points present examples of true art-skill—the power to conceal the method of the work rather than to display it. The manipulation is never overdone ; the touch of the original artist has been artistically, not mechanically, preserved throughout.

Decorative Bronzes.

The very remarkable and extensive collection of decorative bronzes and works in metal which may be comprehended in the second of the classes into which it has been thought advisable to divide the French bronzes for the purposes of this report, will now claim consideration.

As a matter of course, there is an incessant repetition of the same general characteristics. Novelties are attempted by one manufacturer, and repeated in varied forms by others. Thus it frequently happens that a decorative effect, which in itself is tasteful and successful, runs into positive extravagance and mere conceit by changes introduced as variations, which are not improvements.

There are two features in this class of metalwork which give a distinctive character to the collective exhibits, different from that of similar collections in previous exhibitions. One is the extent to which *cloisonné* enamelling has been introduced as a polychromatic and decorative adjunct, and the other is the use

of variegated marble, chiefly the onyx marble or alabaster of Algeria, in connection with metal.

The most remarkable enamelled works, both in size, elaboration of design, harmony of effect, perfection of execution and finish, are to be found in the collection exhibited by F. Barbedienne. In these objects a new development of decorative art in Europe is illustrated. Based on Oriental taste and modes of production, they rival the enamels of the East alike in design as in execution. In the best example, the vitreous colour is rich in tint, solid in the body, and becomes perfectly homogeneous with the metal base, so far as the two substances can combine in the formation of one surface. It would be quite useless to quote special objects here, inasmuch as to appreciate the real position of this phase of decorative art the whole should be carefully examined.

The bronzes, statues, statuettes, busts, &c., exhibited by Barbedienne are of the very highest class as decorative works. The more severe style, however, is avoided. Some of the finest works are in tinted bronze, and probably the best example of this class is a bust of Bianco Capello, a pendant to the Gorgone of the Duchess Castiglione-Colonna, purchased from the Royal Academy Exhibition 1866, for the South Kensington Museum. In its style the treatment of the metalwork is most successful. In the flesh it is large and grand; whilst the decorative character of the costume, which is arranged and rendered with great skill, gives ample scope for the variation of tint in silver, gold and black bronze. Nor does the work lose so much in dignity as might be expected from these variations of surface tint, owing, no doubt, to the thoroughly artistic character of the modelling, which no after treatment in the way of colour could well destroy.

M. Barbedienne has some specimens of casting in bronze, chiefly small busts, in which the amount of metal is reduced to a minimum by skilful casting. In these examples the "core" has been so carefully graduated from the full size of the model, and the fitting to the centre by the moulder so skilfully managed, that the metal is not very much thicker than stout paper or ordinary cardboard.

It may be remarked as worthy of attention by those whose business it may be to arrange works in bronze as the decorative adjuncts of the drawing-room or dining-room, that the French carefully consider the colour of the bronzes which are to form part of any given arrangement as a necessary element in the success of the *ensemble* to be produced. This may appear so obvious as not to be worth mentioning here; but however distinctly the fact may be seen and acknowledged, it is for the most part practically neglected in England.

A certain specialty of treatment has always characterised the amorini of the French bronzists. The works exhibited by Victor Paillard illustrate this in a most pleasing and satisfactory manner. There is a certain degree of conventionality about these works no doubt; in fact they are furniture bronzes of a very high class, and as such they are decorative rather than sculpturesque. It is not often, however, that the character of infancy is so thoroughly well treated. There is a full appreciation of the innocency of childhood in its happiest moods which is rarely to be found in far more ambitious works. As studies of treatment in metal, especially in this direction, M. Paillard's bronzes are excellent, for there are few things done so often by modellers for metalwork as amorini, and certainly there are few things in which so small an amount of real success is achieved.

One of the most useful and suggestive exhibits is that of J. Fel. It illustrates in a very effective manner the method of moulding and casting bronze groups in a complicated character in one "jet." The subject of the Laocoon, the three figures being cast in one mass of metal, is in itself an illustration worthy of careful examination and study. The others simply illustrate special points in the arrangements of the moulds and cores, but repay a prolonged inspection technically, although they have nothing specially inviting about their appearance, as all the "jets" are left upon them as they came from the sand of the casting-pit.

The extent to which the art industry of bronze ormolu has been carried in France, and the excellence of the gilding in brass and bronze by the use of mercury, have become traditional. The electro-deposit process of gilding, even when done with an extra quantity of the precious metal, produces a dull effect in comparison with the rich brilliancy of tint which results from the mercurial system. Unfortunately this process is a very unhealthy one for the workmen, and no one can be surprised that the Imperial Commission sanctioned the award of a "Grand Prix" to M. Henry Dufresne for his invention, by which it is stated gilding by mercury can be executed without danger to the health of those employed in the process.

Personally I cannot say that the examples shown by M. Dufresne appeared to me at all equal to the usual works in ormolu; but from his reputation as a damascene worker and metallurgist of great scientific and practical skill, there can be no doubt he satisfied the jury of the excellence of his system, and it is to be hoped that it will be adopted in England as readily as certain English processes have been adopted in France and with equal success.

Objects in ormolu form a portion of the display of most of the bronzists, whilst in many instances the exhibits consist entirely of works finished in this manner; but it must be confessed that the finest examples are those which have been executed by the more skilful bronzists as special proofs of their skill in this direction.

Amongst the very excellent decorative bronzes of Auguste Lemaire will be found some of the finest examples of ormolu. The "mat" of these works is especially noticeable for its richness of tint, whilst the judicious introduction of "burnish" gives greater value to it, since the latter does not, as is often the case in less artistic specimens, overpower the former.

M. Lemaire exhibits a pair of bronze statuettes of nymphs, designed and modelled by Carrier, also a bacchante crowning a bust of Pan. These works are executed in the artist's best manner, which is always artistically decorative, and, although approaching the conventional, is essentially original. The system of chasing adopted in the flesh portions of these works is very novel and effective, and deserves examination and study. It may, perhaps, be considered too near an attempt to imitate the pores of the skin; and when looked at very closely this objection holds good, but seen at a proper distance it imparts a charmingly soft surface to the bronze, making the flesh portions contrast well with the drapery, and yet the metallic character of the material is in no way interfered with. It may be "trick," but it is so skilfully and artistically done that one is not disposed to find fault with it, although in the hands of an unskilled chaser the effect would become vulgar and commonplace.

Zinc-bronze and Zinc.

The production of decorative objects in zinc has taken a very decided position in France. At first it seemed destined to be confined to architectural details of various kinds and to objects suitable to the flower garden and hothouse. The application of the electro-galvanic process, by which the surface could be covered by a deposition of metal and made to imitate bronze, and by which also it could be silvered and gilt, not to mention the more factitious methods of colouring the zinc surface to imitate bronze without incurring the cost of any metallic deposit, has led to the development of a very extensive manufacture in Paris. Practically this industry has arisen since the International Exhibition in Paris in 1855, on which occasion there were but comparatively few specimens of zinc, electro-coppered and bronzed, displayed.

In the present exhibition the aggregate display is a very extensive one, but it is simply a reflex of the style and art-power shown in the production of bronzes, occasionally running into decorative excesses in the way of gilding, variegated tintings, imitations of coloured enamel, &c. The works are chiefly reproductions of bronzes, cheapness being the main object. Little originality is attempted, and when such is the case it mostly runs into an extravagance which would not be tolerated in the true bronze. Occasionally the treatment is heavy, and more like that of carved work in stone or marble rather than of works modelled to be cast in metal.

It would be easy to dismiss these zinc-bronze works as "shams," and so far not worth further notice, but as they are honestly shown as imitations, and present features in which considerable art-skill is combined with much ingenuity in manufacture, they are so far worthy of examination as specimens of a distinct industry.

In the less complicated works a plaster-of-Paris mould will yield three or four, and sometimes more, castings in zinc, thus giving a great economical advantage over the casting of a bronze of the same character. As regards the comparative durability of works in zinc properly covered with a deposit of bronze or copper, it must be borne in mind that the zinc has such an affinity for the deposited metal as to practically unite itself with it more firmly and tenaciously than would be generally supposed. This is the best possible guarantee for the enduring character of the surface, which becomes as far as possible homogeneous with the metallic base constituting the cast.

As an illustration of the extent to which extravagance in colouring, enamelled effects, gilding, silvering and the admixture with other materials is carried in zinc-bronze objects, the exhibit of L. Hottot may be quoted. Here even flesh tints have been introduced, and imitation enamels in green, red, blue and black predominate over the bronzed surface of the zinc; and these things are made still more garish by imitation ormolu and silvered effects—a warning to all who desire to see true art-manufacture make that genuine progress which comes of art-skill directed by science and common sense.

As might be expected, the prices of these imitations vary considerably from those of similar objects in bronze. There is, however, no fixed proportion, as the prices vary from one-third to two-thirds less, and the average may be taken at about one-half.

There are a few exhibits, chiefly in Class 40, of works in

zinc, uncoloured and ungalvanised. The most remarkable example is that contributed by Grados. It consists of an architectural structure suitable for a gateway to a park or garden, and forms the entrance to the French galleries for the class in which it is placed. The columns and archivolt of the central opening and the architecture of the two sides are all of a decorative but decidedly architectural character. It is severe in its adherence to architectural precedents, and the workmanship is excellent; but, as the forms are those usually seen in stone, the lithic character of the treatment contradicts the metallic material in which the work is produced, and it is rather a lesson what to avoid than one suggestive of imitation.

Works in Cast-iron.

Allusion has been already made to the remarkable progress which the numerous contributions in cast-iron prove to have been made in France. This progress creates no surprise in those who have watched the development of the bronze industries, because it was inevitable that the art skill and power obtained over the various conditions necessary for making good castings in metal, although in the first instance applied to works in bronze and zinc, would of necessity be directed to the production of works in iron, when the gradual development of the French iron trade rendered such an application of skill to the cheaper material at all feasible. The result is now before us in the several contributions of leading French ironfounders. The quality of the iron is excellent as regards its surface and perfect finish as a casting material. It is said to be rather brittle, as is usual with charcoal-made iron.

Contrasting the very remarkable series of examples now exhibited with the few specimens of ornamental iron casting which were the subject of so much pride and congratulation in 1844, the change is a triumphant answer to those who so rashly declared at that period that whatever France might do in the production of art-bronzes, the casting of such works in iron or anything approaching to them would always be beyond the power of French artists or artisans to accomplish. Here, however, all is done which was so dogmatically pronounced as impossible, and very much more than even those who calculated what the art-power and manipulative skill and experience gained in the bronze-foundry would be likely to do, could have expected.

Although it is not proposed to discuss the question of ornamental or artistic iron casting at any great length, yet the successful application of the founder's art in this direction renders it desirable that certain salient points should be noticed. The practical ironfounder cannot look upon these specimens of his industry without receiving many invaluable hints from the skilful and thoroughly artistic manner in which these works have been treated by the moulder. The wonderful sharpness and beauty of the smaller specimens, the slight seams left on the surface from the perfectly even and correct fitting of moulds or "cores," the fact that very complicated examples are cast in one piece, and that this has not been done once or twice only and as a *tour de force*, but is the rule rather than the exception, all tend to prove that the skill of the French ironfounder has overcome most, if not the greatest, difficulties in the art of casting in metals, and especially in iron—a material of which twenty years ago he was traditionally supposed to know little or nothing, at least, industrially.

Prussia.

As might be expected, from the traditional skill of the workers of Berlin in cast metals, the bronze and iron castings of Prussia are of a high class in the best and most representative examples. The style of finish varies as much from the French as the nature of the objects selected and the treatment of the modeller. This treatment is invariably more statuesque and architectonic, without running into severity or stiffness. The chasing, too, in the best examples, is careful without being mechanical; rarely, if ever, running into the English mistake of over-finish, to the destruction of the spirit of the original model. In short, the Prussian chaser is as much an artist as the modeller, and probably, in most instances, is the same individual; at least, there is strong evidence of this fact in the best examples.

Bronzes.

As a specimen of refined casting and chasing in bronze, the reduced reproduction of the great monumental erection at Berlin to the glory of Prussia, the equestrian statue of Frederick the Great, executed by Rauch, in 1856, is the most perfect example of German taste and skill in this direction. Every portion of the detail of this noble national monument is carried out with a conscientiousness quite unique; no point has been neglected. From the most elaborate and important down to the minutest detail of the work, all is in harmony. As a lesson in the bronzist's art it could scarcely be surpassed. Happily too, there is no affectation of colouring or tinting in any way; and the metal being thus left in its integrity, tells its own story, so to speak, without any adventitious adjuncts or trickery.

Another remarkable specimen of art-bronze founding is a group, about one-fourth life-size, of a young mounted Greek killing a lion. This work is modelled by Albert Wolff and cast by Gladenbeck. It is of the same type of subject as the Amazon, by Kiss. The arrangement of the parts for the purpose of sustaining each other and yet preserving the utmost freedom of action, in horse, rider and lion, is very skilful. There is no sacrifice of art to the exigencies of production, but both are made distinctly subservient to each other, and both unite to produce a complete result. The horse rears on his hind legs, one foot being placed on the inside of the thigh of the fallen lion, the other resting on the base. The lion, wounded by a spear broken in his side, rises with his head, chest and fore legs, and is dashing, open-mouthed, at the fore-quarters of the horse, having already struck him with one of his claws. This claw and the fore leg is made to support the whole weight of metal in the mounted figure, the fore legs, head and fore-quarters of the horse. The rider is poised in his seat with a graceful and vigorous action, as he is about to strike the lion with another spear which he holds ready in his right hand. As a work of art, this bronze is very fine; but as a casting and as an example of the skilful arrangement of materials in perfect quantities, it is a lesson of no ordinary character.

Two large and important works are exhibited by Count Einsiedel, of Lauchhammer, together with a few small objects in bronze. These colossal statues of Frederick the Wise, of Saxony, and Philip, the Landgrave of Hesse, are thoroughly German in character. They are large in treatment; with an intelligent attention to costume. The finish is excellent as applied to works of colossal size. The artist has evidently studied, and with decided success, to render the moulding as easy as possible, the parts being kept in masses; yet nothing is sacrificed either in the way of truth of effect, dignity of pose or artistic arrangement, to the exigencies of making the cast practically in one piece.

Cast-Iron.

In addition to these colossal bronze statues, Count Einsiedel exhibits some very remarkable specimens of iron casting. A panelled iron door forms the centre of the group of which the two bronze statues are the lateral supporters. It is an elaborate and successful example of iron casting in the best manner. The design is admirably adapted to bring out the skill of the moulder and founder, and to show to what extent finish in this material can be carried in the casting pit or frame in skilful hands. The details of the ornamentation are very perfect, especially in the floral design in the panels. The figures are a little hard in effect, but this is a general characteristic of German castings of the draped figure.

Italy.

The Italian bronzes are chiefly reproductions either of full size or on a reduced scale of antique works. The skill shown in most of them is very great, in fact, perilously so for purchasers travelling in Italy. The fractures, patina, stains, dints and other damages incidental to disinterred objects of bronze art, are so skilfully reproduced, especially in the smaller and more portable examples, as to render some considerable insight into the "art and mystery" of the manufacture of old things from new materials indispensable before giving a judgment or making a purchase. One can therefore excuse the pertinacity with which an amateur who has seen an antique (?) bronze discovered in some classic spot, and dug up in his presence, adheres to his opinion that it is genuine in every particular.

It would be quite useless to note special examples of this integrity of reproduction, as nothing but a careful personal examination will be of the least value in forewarning collectors as to the only truth about the works—the truth of imitation.

In the larger reproductions there is less elaboration of the incidental details of forged antiques, but the skill of imitation is none the less evident on that account.

The peculiarity of the larger examples of the Italian bronzes above named is the remarkable absence of any appearance of an artificial system of colouring the metal. Of course, this is simply an appearance, as in reality they are most carefully treated; but then this is done with great skill, and is evidently not the result of any sudden or violent chemical action. In short, the object of the Italian mode of treatment is to give as nearly as may be the tone and tint which time gives, and not a special colouring as part of the artistic effect to be produced, which is essentially the French system, tint being an element of finish.

Conclusion.

In concluding this report I may be permitted to state that, as far as possible, every section of the class of objects included in the arrangement adopted by the French executive as belonging to Class 22, of which there are examples in the exhibition, has been examined and noticed, so far as I deemed them of practical value to the artist, the manufacturer or the artisan. The objects specifically described appeared to me to possess points of special interest likely to be valuable to those engaged

in the same or in kindred industries, or to present features which it seemed desirable to record among the achievements of art, science and manufacture in their relation to each other. In this respect the object I have sought to accomplish has been to make this report at once a lesson and a record—a lesson, so far as my knowledge and experience of art, as applied to manufacture, would enable me to apply the principles and practice accepted as the foundation of success in the great works of past ages and even of the present time, and a record of such novel features as appear likely to influence the future, whilst indicating the progress of the past twenty years by the facts derived from personal experience and observation, the result of opportunities of a somewhat exceptional character, but which rendered the task undertaken so much the more difficult to fulfil to my own satisfaction.

THE LATE GEORGE WALLIS.

MANY of the older art-students in Manchester and elsewhere, says the *Manchester Guardian*, will regret to hear of the death of Mr. George Wallis, F.S.A., late museum-keeper of the art-collections at South Kensington, and a former distinguished head-master of the Manchester School of Design. Mr. Wallis was born at Wolverhampton in 1811. At sixteen years of age he left Wolverhampton Grammar School with the determination of becoming an art-student. With this end in view he first visited Liverpool, but finding few facilities there for pursuing his studies he made his way in 1832 to Manchester. The art-world of Manchester at that period was exceedingly limited, its best men being William Bradley, Charles and Michael Calvert, James Parry, Arthur Perigal, John Ralston and Peter Williamson. George Jackson, with whom Wallis became afterwards so intimately associated in the work of the Manchester School of Design, was then following the humble occupation of a Roman cement ornament maker in Greengate, Salford. The facilities afforded too for art-study at the Royal Institution were of the most meagre character, as is evidenced in a passage in B. R. Haydon's journals of May and June 1837. "I find Manchester," writes Haydon, "in a dreadful condition as to art. No school of design. The young men drawing without instruction. A fine anatomical figure shut up in a box; the housekeeper obliged to hunt for the key. I'll give it to them before I go." Notwithstanding these drawbacks, the experience gained gave the keynote to Wallis's future career. "Thrown thus early in the very centre of a certain class of industrial design, and associating with patrons of art engaged in calico-printing, George Wallis," we are told, "became interested in an industry which appeared to him as singularly illustrative of the then essentials of modern decorative art, the perfection of science in machinery, a complete range of colour in chemistry, with the greatest possible freedom as regarded the art-conditions of design. The fact, however, that nearly all designs came from the Continent, and that Manchester paid 30,000*l.* per annum to Paris for such designs, which were frequently spoiled by the ignorance of elementary art in the 'sketch-maker' and 'putter on' in the technical adaptation of the pattern, appeared so preposterous that George Wallis naturally asked himself why these things were, and came to the conclusion that a more diffused knowledge of the art of design as applied to manufactures, based on sound elementary instruction in drawing, had become a national necessity. A visit to London in 1836 to see the exhibitions of the year opened a new field of observation and had a marked effect on his productions for the annual exhibition at Manchester, as it also helped to confirm him in his views of the national importance of artistic training." Wallis at this period worked hard as a landscape and historical painter and was an occasional exhibitor at the Royal Institution. He subsequently exhibited at the Royal Academy and British Institution, but never achieved any distinction as an artist. In 1837 he visited the Potteries in Staffordshire. Here he was as much struck with the poverty of artistic designs as he had been in Manchester, remarking that "a greater wilderness of ugliness it was impossible to conceive, and that with the exception of some good flower-painting at Daniels's (afterwards Minton's) there was nothing to show that Josiah Wedgwood had ever lived and laboured in that locality."

It was mainly owing to the persistent preaching and teaching of Haydon that Manchester saw its School of Design established in 1838. To the meeting held for establishing that school on February 19, 1838, Haydon was invited by the chairman, Mr. James Heywood. Other moving spirits in the establishment of the school were George Jackson (the first hon. secretary), James W. Fraser, Edmund Potter, Joshua Satterfield, Joseph Lockett, Salis and Louis Schwabe. Haydon, writing to his wife from Leeds on November 3, 1838, referring to the recently-formed school, remarks:—"At Manchester last week they told me that Chantrey, Wilkie and Shee had been there, and that Chantrey grumbled at the School of Design; but they told me that their influence was gone. The school is getting on pretty well. I am to make a report to the committee. It is infinitely better than it was, but on my second visit I had to find fault." What Haydon was doing for the advancement of art design in a general way Wallis was accomplishing in the various centres of industry with which he became identified. As we are told, "It is now generally conceded that about this date art as applied to industry and decoration had reached its lowest point. Haydon preached the study of pictorial art as a remedy, but the real question was a revival of art power in our artisans in its application to their everyday work. George Wallis saw this and worked in this direction." In 1837 he returned to his native town, Wolverhampton. In 1838 he delivered his first lecture in the Athenæum of that town on the "Cultivation of Popular Taste in the Fine Arts," and in 1839 another on "The Principles of Natural Form." Government now established a central school of design at Somerset House, under the direction of William Dyce. In 1841 Wallis joined the normal class for the future masters of schools of design, and carried off one of the six exhibitions offered by the Board of Trade. In January 1843 he was appointed head-master of the Spitalfields School of Design, London. This position he held with much distinction until the following December, when, on the resignation of its first master, John Zephaniah Bell, he was appointed master of the Manchester School of Design. The school, which had been in existence some six years prior to Wallis entering on his duties, had made fair progress, but it received a decided impetus from the new master. The school, originally founded, independent of Government aid, by a local council on a plan recommended by Haydon, subsequently adopted the scheme of Somerset House, which mainly led to Wallis's appointment. "His success here," we are told, "was unmistakable, whilst the course adopted at Somerset House—Mr. Dyce having retired as director and accepted the post of inspector of the provincial schools—had been the very reverse. This led to complications alike in London and the provinces, and a proposal was made to adopt a system said to be followed at Toulouse, for teaching the drawing of the human figure from flat examples. Mr. Wallis, having hitherto taught the figure through the cast and anatomy only, declared that the system proposed was much 'too loose' for him, and naturally declined to adopt it." At the reopening of the school under its new master (January 15, 1844) Wallis explained, in an address to the students, the new system of instruction intended to be pursued, and the discipline which would be enforced according to the regulations of the Central School at Somerset House. His various reports to the Council showed the rapid advances the school was taking, though he was not quite convinced that it was carrying out its mission as perfectly as it ought. In October 1845 he addressed an important "Letter to the Council of the Manchester School of Design on the System of Instruction pursued in that School," which was published and extensively circulated. In every way he endeavoured to carry out in the most practical manner his ideas of what a school of design should be in a great industrial centre like Manchester. He was constantly appealing to calico-printing firms requiring youths possessing a talent for art to communicate their wants to the school. Then he never missed an opportunity to address his students on any subject which bore the slightest relation to their studies. The last year (1845-46) he held his office he successfully organised an exhibition in the galleries of the Royal Institution, Mosley Street, of examples of art and industry combined. During the time this exhibition was open Wallis delivered a series of powerful lectures on "The History, Principles and Practice of Ornamental and Decorative Art"—lectures which attracted, considering the subject, very large audiences. In alluding to this exposition the *Art Union* (afterwards the *Art Journal*), in January 1846, remarks:—"This exhibition was opened to the public on Monday the 22nd (December 1845), and has excited great attention, not only from its novelty, but on account of its intrinsic merits. . . . We may here state that though in extent and variety the Manchester exposition cannot be compared with any of the great displays on the Continent, it nevertheless contains articles of great merit in textile fabrics, porcelain, the precious metals, electro-plated goods, carved wood, stamped leather, papier-maché, &c. The prize designs of the pupils of the school exhibit creditable proofs of progress; and though the printed patterns of mousselines, chintzes and furniture cottons are far from realising our notions of perfection, they are indisputably far in advance of the patterns which were prevalent in Lancashire a few years ago." So much importance was attached to the subject that the proprietors of the *Art Union* issued a special illustrated supplementary number entitled "Exposition of British Industrial Art in Manchester," which, as they remarked, formed "not only a guide and catalogue, but also a historic record which may afford important aid to those who may subsequently engage in the getting up of similar expositions." In his preliminary remarks the writer of the article pays a well-merited tribute of praise to Wallis as the originator and to Manchester as the pioneer of these industrial art expositions in England. One of Wallis's pupils at the school—one who took the second prize

in the prize competitions at this exhibition—was afterwards a distinguished member of the Manchester Academy of Arts and Royal Water-Colour Society—Mr. H. Clarence Whaite. Another distinguished pupil in the school under Wallis, and a first prize exhibitor of an original design, in one colour only, suitable for a muslin print, called *Cullings from Nature*, was Mr. Thomas Oldham Barlow, R.A., the famous engraver. Other pupils connected with this exposition were Mr. W. G. Gibbs, Mr. Robert Mudd, Mr. Edward Furniss and Mr. William Wallis. During his residence in Manchester, Mr. Wallis paid a visit to Paris to inspect the Quinquennial Exhibition of the National Art and Industry of France, held in 1844. "A careful inspection of the Communal *Ecoles des Dessein*," it is said, "confirmed Mr. Wallis in his views of the inapplicability of the French system of instruction to English wants, and of the importance of periodical displays of art industry, and side by side with his advocacy of art education for the people he urged the necessity for such exhibitions." How he raised the character of the School of Design in Manchester—seconded as he was, too, by the valuable co-operation of the then honorary but most energetic secretary, Mr. George Jackson—is exhibited in every passage of its progress. It was mainly owing to the line taken by Mr. Wallis and the Council of the school that Joseph Brotherton about this period introduced a Bill into Parliament "to enable Town Councils to establish museums of art in corporate towns." In the early part of 1846 Mr. Wallis resigned his position. His reasons for so doing are best explained by the Council in their report:—"The resignation of Mr. Wallis is the result of circumstances arising out of instructions as to the mode of tuition conveyed from the Government School at Somerset House, which Mr. Wallis, regarding as at variance with his own views, felt that he could not consistently adopt, and in consequence tendered his resignation. This resignation your Council, after the most careful consideration of all the circumstances, and with every desire to have retained Mr. Wallis as their head-master, felt themselves called upon (not without deep regret) to accept. With this expression of their feelings on the subject, your Council desire to add how much they are indebted to Mr. Wallis for the zeal, talent and unwearied industry evinced by him in the discharge of duties of no ordinary kind, the results of which have been manifested in the great progress made by the pupils under his able superintendence, and so fully evidenced by the specimens of their art at this moment in the course of exhibition on the walls of the Royal Institution."

Soon after Sir Henry Cole established his *Journal of Design* (in 1848), Mr. Wallis became one of its most valued contributors. His help was enlisted in organising the great embryo Exhibition of 1851. In connection with that historical undertaking, he acted as deputy commissioner for the eastern district of London, most of the counties in the North of England, and the whole of Ireland. Returning to London, he assisted in laying out the general space of the exhibition in Hyde Park; was superintendent of the British Textile Division and deputy commissioner for the textile group of juries. During his engagement with these arduous duties he was offered the head-mastership of the Birmingham School of Design. This offer he at first declined, but afterwards accepted. During his residence in Birmingham he was appointed a commissioner—with the first Lord Ellesmere, Sir Charles Lyell, Sir Joseph Whitworth, Sir C. Wentworth Dilke and Professor John Wilson as his colleagues — to visit the United States and examine and report on the state of art, manufactures, &c. Mr. Wallis's report on arts and manufactures and Sir Joseph Whitworth's report on machinery formed undoubtedly the two most important results of the commission. With the Paris Exhibition of 1855 he was intimately associated, being charged with the organisation of the British and colonial section. It was during this year that he may be said to have initiated the system of loans from South Kensington to local or provincial exhibitions, having induced Sir Henry Cole to send the first collection from the Museum to the School of Art Exhibition at Birmingham. Owing to various causes Mr. Wallis, early in 1858, resigned his position as head-master of the Birmingham School of Art and art superintendent of the Birmingham district. In 1863 he was appointed keeper of the art collections at South Kensington. This office, owing to advancing years, he resigned only a week or two ago. His last official connection with international exhibitions was at Paris in 1867, when he was superintendent of the British section in that part of the exhibition illustrative of the "History of Labour." His public appearances since that period have been mostly at annual meetings or distributions of prizes in schools of art, particularly of those with which he had been more or less personally associated. His last appearance in this capacity was in connection with his old school in Manchester in 1878, when he delivered an address to the students of the School of Art.

By his marriage—early in life—Mr. Wallis had a family of six children, four of whom survive. The eldest son, Mr. George Harry Wallis, who was for several years assistant to his father at South Kensington, is the director and curator of the borough of Nottingham Castle Museum and Art Gallery, where he has done some admirable work since his appointment in 1877. His youngest son, Mr. Whitworth Wallis, has won much distinction as the director of the Birmingham Corporation Museum and Art Gallery, whilst his youngest daughter, Miss Rosa Wallis, of South Kensington, is an artist of high repute, who has devoted herself to flower-painting in pure water-colours, and who has been for some years an important exhibitor at the Royal Academy, Royal Institute of Painters in Water-Colours, Society of British Artists, and at the Birmingham autumn exhibitions.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE second lecture of the session was given by Mr. Thomas Mair, tilelayer, his subject being "Fireplaces." The president, Mr. William J. Anderson, occupied the chair. Mr. Mair gave the experience acquired in many years' practice, and, while approving most of the model of fireplace his name is connected with, did not confine attention to it, but extended his notice to all other types commonly in use. The proportionate dimensions of fireplaces in relation to the apartments they heat, and the fuel required to give in winter 60 degrees temperature, he had tabulated. All iron he would prefer to see give place to tiles, as better radiators of heat. Flues in general, he thought, were built too small. Dog-grates, so admired for appearance, not infrequently prove troublesome. The ordinary causes were noted, and the remedial methods the lecturer adopted were described with the aid of diagrams. The customary vote of thanks was awarded at the close.

RESTORATION OF PILLATON HALL.

DURING the last three or four years, says the *Staffordshire Advertiser*, the old moated mansion of Pillaton, near Penkridge, the ancient seat of the Littleton family, has been in process of restoration, and the venerable pile now presents many features of interest, not only on account of its antiquity, but chiefly because of the fact that the restored portion of the mansion is, so far as can be traced, an exact counterpart of its appearance some three hundred years ago.

The remote antiquity of Pillaton Hall is sufficiently proved by early ecclesiastical records, which in the eleventh century describe it as a "capital mansion," the tenant of which for the time being was bound to lodge the abbot "honourably" whensoever he should travel in those parts and "desire to divert himself there." The history of the present building dates from the year 1480, when Richard Littleton built the chapel of stone (dedicated to St. Modwena) and the domestic buildings and offices of brick. Seven Sir Edward Littletons in succession inherited the family mansion at Pillaton, and the eighth, who succeeded in the year 1742, pulled down a large portion of the old house and built a new hall at Teddesley. During the partial destruction of Pillaton a large number of foreign coins were found concealed behind an old wainscot, of the aggregate value of some 16,000*l*.

For about a century Pillaton remained much as a writer in the *Gentleman's Magazine* described it in 1789. Except for some fragments of a wall, a few picturesque chimneys and a great oven, only the range of buildings which bounded the northern side of the quadrangle remains. This is the part which has recently been undergoing restoration. It consists of the chapel and gatehouse. The towered gateway is of three storeys, flanked by four corner turrets pierced with arrow-slits. On either side are two storeys of small rooms, those to the left as seen from the front facing the chapel. This venerable edifice, after centuries of disuse, was restored a few years since by the late and much-lamented Hon. William F. Littleton, C.M.G., and is now regularly used for divine service. It contains, among other interesting details, two lynchnoscopes, or "squints," narrow, oblong, slantwise slits through which the altar might be seen. A stone in the east wall is inscribed with a device of fifteen small triangles. The restoration of the chapel is very complete down to the minutest detail, and bears ample evidence of the labour of love which the work afforded to the late Mr. Littleton, who personally superintended it in every stage of its progress, and to whose intelligent research and cultivated taste the artistic completeness of the restoration is mainly due.

Within the last two years the restoration of the rooms adjacent to the chapel has been effectively carried out, mainly under the superintendence of the Hon. Henry Stuart Littleton, the original features being reproduced with great fidelity and minuteness of detail.

In the course of this later restoration a curious painted wooden figure was discovered in a hidden recess, the date of which is believed to be as remote as the thirteenth century, and

its history has given rise to much speculation among archæologists. A lady writer in a recent number of the *Antiquary*—Charlotte S. Burne—has given an ample and lucid description of this lay figure. It is, she tells us, 19 inches in height, and represents a man in a sitting posture, his hands on his knees, and his elbows raised and turned outwards. His face is turned to his own right, the mouth slightly open, showing his teeth, and his general countenance determined and threatening. His hair, which has been gilded, is cut short and straight across the forehead, but long at the sides, where it has a stiff horizontal curl. He has no beard, but there are evidences of incipient whiskers. He is clad in a long-sleeved collarless tunic, belted at the waist and reaching to the ankles. The cuffs, belt and bands are gilded. The right shoe is brown and the left green. A voluminous gold cloak, lined with blue, hangs from the shoulders and is arranged over the knees. A slender gold circlet on the head and large white gauntlets, with a red pattern on the back, complete the costume.

It was found in a recess behind the chimney in the first-floor room. The recess is 30 inches square and of the same height as the room. It was entirely plastered up in front, making the wall of the room level with the chimney-jamb, and was only accessible from above where there was a space among the rafters. It is just such a hiding-place as in many old houses—such as Boscobel for instance—is known as a "priests' hole," or hiding-place for the recusant clergy of the stormy times of the Great Rebellion.

The figure was exhibited at a meeting of the Society of Antiquaries some eighteen months ago, when its date was determined, and it was said to have a resemblance to the grotesque stone monarchs who till lately sat in the niches in the west front of Lichfield Cathedral. But what the figure really represents or how it came where it was found, are matters of conjecture, all the more puzzling when it is considered that it is to all appearance some two centuries older than the house in which it lay so long concealed.

ENGINEERING.

THE inaugural address to the members of the recently-formed Carlisle Architectural, Engineering and Surveying Association was delivered by Mr. W. Howard Smith, city surveyor, in the committee-room of the Town Hall. The chair was taken by Mr. H. Higginson, architect, and the three professions were well represented.

Mr. Howard Smith having first stated that the formation and aims of the Society had his full concurrence, he proceeded to remark that architecture, engineering and surveying were closely allied professions, and instanced his own experience as a proof of that. He was articled and spent the first few years of his life with an architect and building-surveyor in London, but finding engineering work more to his taste he, after having attended several courses of lectures at King's College, obtained an engagement upon the engineering staff of one of the principal English railways. He then turned his attention to gas and water-engineering, and after two years of this was engaged upon the working surveys and soundings for the Channel Tunnel. When the headings of that tunnel were stopped by Government he went abroad, and was employed upon the exploration for and construction of a railway in Brazil. When this was finished he returned to England, and was made Parliamentary Surveyor for 73 miles of a proposed railway in Yorkshire. He then went to Ireland and made a survey for what he believed was the first proposed light railway. Returning from Ireland, he became resident engineer in charge of the construction of some railways in the West Riding, being afterwards appointed deputy borough surveyor of Leeds, and coming thence to Carlisle. Mr. Smith next dealt with the general outline of municipal engineering in all its numerous branches, illustrating it by means of a diagram, similar to that prepared by the city engineer of Liverpool for the recent Congress of Hygiene and Demography. From a study of that, he said it would be apparent that it was almost an impossibility to be thoroughly master of the whole of the subjects in all their details, but there was no reason why an amount of knowledge should not be acquired of each such as would enable the municipal engineer to give reliable advice upon any of them. The use of such a Society as this was the imparting of knowledge and he gave a sketch of the workings of the Architectural, Society of Leeds, with its museum and sketching club, aided by the Yorkshire College, with the view of showing how much could be done in the way he had indicated. Then followed some pertinent observations upon competition and the professional training received by young men, Mr. Smith adding that in his experience young architects and civil engineers were not sufficiently practical. He thought it would be well if, after a young man had served his pupilage in an office, say for three years, during which time he should have acquired a fair knowledge of the theory of his profession, he were to spend a couple of years either in the workshops of a builder or of a mechanical engineer. Generally speaking, those in large towns had better opportunities of acquiring knowledge in these professions than those in smaller towns, but with the establishment of technical and art schools he thought these advantages would be to some extent more nearly equalised. In conclusion, he urged the members of the Society to remember that success could only be obtained by the reading of good papers, by harmonious working and by regular attendance at the meetings.

"Antiquity after a time has the grace of novelty."—Hazlitt.

HAYDON'S APPEAL.

IN 1820 Benjamin Haydon exhibited his *Christ's Entry into Jerusalem*, on which he had been engaged for six years, in the Egyptian Hall, Piccadilly. The experiment was novel, and it was not approved by all. A publicist of the day who was friendly to the artist, and pronounced the picture to be the finest historical picture ever produced in England, commented on the policy of exhibitions in the following words :—

"The plan of a public exhibition, at a shilling a head, is, we think, a bad one on the whole, though it would be clearly unjust to place the fault chiefly to the artist, as has been sufficiently explained in the preceding observations. Yet we cannot help suggesting that the painter who should occasionally employ himself on portrait, as a means of subsistence, and at the same time devote himself with ardour to history, as the means of fame, would (if the union be practicable, which perhaps it is not) take, in our view at least, a more dignified and pleasant mode of providing for his necessities. Public exhibitions (we mean exhibitions conducted by the artist himself) involve a number of things in their train which can have no salutary effect on an artist's character. Descriptive catalogues, advertisements and posting bills are dangerous stimulants, besides the temptation unduly to consider the popular taste in the selection of a subject, and to introduce accessories calculated to gratify popular prejudice in the mode of treating it. If we were once assured that an artist had fairly adopted this system, and meant to stick by it, we certainly should not lend ourselves to an abuse of terms by describing him as engaged in a gallant struggle for the triumph of high art and the elevation of the fame of his country. The utmost we could conscientiously say in that case would be that he had resolved on distinguishing himself, that he possessed great talents to effect this, and was not averse to supply all deficiencies, as well in them as in his opportunities, by a dexterity of management not exactly reconcilable to that dignity with which the public display of genius should always be invested. It is very possible, however, that in such an example we might see more to regret than blame ; we might acknowledge the influence of necessity rather than of personal disposition in the result, and deplore that a want of generous allowance and magnanimous encouragement at the outset had driven a noble ambition to avail itself of unworthy resources. We are carefully informed in his advertisement that his picture has been 'six years on the easel.' What is meant by this ? Does he mean to say that he cannot paint such a picture in less time than six years ? And if he has only been prevented by accidents from completing it sooner, what ground of boast is there in the delay, or what occasion for its announcement ? The public, we think, have nothing to do with the time employed in productions of talent to which their attention is called. Suppose we were to advertise 'a criticism on Mr. Haydon's picture which has been six hours on the author's writing-desk' ! The advertisement would be a silly one, that's all ; nor can we regard Mr. Haydon's as judicious. The fact is, that we see here the artist's eye turned towards the door of his exhibition-room. 'Six years on the easel' is something for those to repeat who could say nothing for themselves. It serves to raise the eyebrows of country cousins. It may be whispered round a female group, passed from a pretty girl's lips to her sweetheart's ear, stimulate the curiosity of papa, overcome mamma's economical scruples, and thus fix the tardy consent to pay a family visit to Bullock's the first fine day."

One of the changes produced since 1820 is in respect of similar exhibitions. Nowadays it would not be considered as derogatory to art if a painter hired the Egyptian Hall, but Haydon as a pioneer had to suffer from conservative criticism. He found compensation by the receipt of 1,700*l.* The price that Haydon placed upon the picture was 3,000 guineas. A committee was formed for the purpose of purchasing it, and presenting it to a church. The trustees were Sir George Beaumont (the amateur whose recipe about the "brown tree" in a

landscape will make him remembered) and Mr. G. Phillips, M.P. Among the subscribers were the Marquis of Stafford, the Marquis of Lansdowne, the Earl of Aberdeen, Lord Ashburnham, &c. It was afterwards exhibited in Edinburgh, and a writer in *Blackwood* described him as "greasy-pate Haydon," because the painter belonged to a set with Leigh Hunt and John Keats. Haydon was then in his thirty-fourth year, but he had gone through a more varied experience than many of his older contemporaries. He had discovered that, in spite of all his efforts, the public and purchasers of pictures were not disposed to accept him as the regenerator of art, and that aims, however exalted, were not a preservative against visits from sheriffs' officers. The truth, it is now seen, was that Haydon was better as a teacher than as a painter. His pupils went beyond him. Haydon was a skilled writer, as the following appeal which he made to the public "On the Relative Encouragement of Sculpture and of Painting in England" will testify :—

"There is nothing of which the nobility and the public of this country are so little aware as the expenses of a great historical picture. A sculptor, an architect, and a portrait-painter are allowed to estimate their expenses, to calculate their time, and to put upon these a reasonable profit, that they may live respectably and like honest men ; but the moment these things are done conscientiously by an historical painter, from the comparative ignorance that exists of the nature of his undertakings, and from the greatness of the sum required, an outcry is raised of the exorbitancy of his expectations and at the supposed unjustifiable nature of his pretensions.

"The other reasons for this are evident. For sculpture, for architecture and for portrait-painting there is a demand ; and the world must allow a man a fair profit on what is essential to its own pleasures or its own comforts ; but for historical painting there is no demand, and the purchase of such a production as an historical picture in England is considered a voluntary piece of charity on the part of the gentleman who purchases, and a voluntary piece of conceit on the part of him who has painted it, more gratifying to his own presumption than essential to his country : 'Quod super nos, sed nihil ad nos.'

"Nothing can be more essentially different than the modes of encouraging sculpture and painting with us. No sculptor begins a national work without an order ; he expects and he is paid half its price to meet the necessary expenses ; he makes a model in clay, which can be chiselled on the marble for eight or nine months by other hands than his own while he proceeds with other models, and finally goes over his work before he sends it home, and then receives five, six or seven thousand pounds for his production. The consequence of this rational and fair mode of patronage is that the sculptor works with tranquillity and ease ; he meets his expenses without anxiety by the advance of half his price, and, conscious of having his reward at the end of his labours, he completes his statue without impediment, because he is allowed to put a profit on his labour and his time.

Look you now what follows.—Hamlet.

If an historical painter wishes to paint a great picture, he begins it without employment, because it is not wanted, though everybody is convinced it ought to be done. He paints every touch with his own hand ; he meets his continual expenses in the best way he can, for his 'revenues' are like those of Horatio, 'naught but his own good spirits to feed and clothe him.' He sends it into the world finished by violent snatches of labour in the intervals of pecuniary want ; he takes years about it, if he wishes to do it well, and then, when he asks the price which will remunerate him fairly, he finds the sum so large that the nobility and the public, from knowing nothing of the circumstances connected with large pictures, accuse him of being either fond of money or of wishing to take advantage of the approbation they have given ; whereas he is actuated by a sincere desire to place himself above difficulty in putting a fair profit on his time and expenses, so that he may try for once what he can do when his mind is unshackled and free.

"I appeal to the country if this is a fair state of things. Is historical painting, or is it not, essential to the pleasure and the greatness of this country? If it be, ought historical painters to be left in such a state of uncertain reward?

"An historical painter is not like a poet ; he cannot put forth his effusions in the fields or in a small room ; he must have a large painting-room and a plaster-room ; he must have casts, books, prints, draperies, lay-figures, armour, hair and models of every description if he wishes, as he ought, to paint everything from nature.

"Again, in England time is so valuable to all, and all is so occupied, that no individual with either a fine head or a fine limb can sit to a painter unless he be amply remunerated for the loss of time occurring in consequence of his absence from his daily occupation. A guinea a-day, five shillings an hour and even a half-guinea I have constantly paid for good models, and good models are as essential to a painter as good brushes or good colours.

"These are facts of which the English nobility and people are not aware, for it is generally imagined a painter paints everything 'out of his own head,' as it is often expressed. This is done by many ; but Raphael, Titians, Correggio, Michel Angelo and Rubens had no such dependence upon unassisted powers, and if Englishmen look on these great men as fit examples, they must, in addition to the talents bestowed on them by nature, whatever they may be, bring to their aid the same artificial and natural means as were not disdained by their illustrious predecessors.

"An apology is now requisite for the intrusion about to follow of what relates more immediately to myself ; but as this letter is in part a defence of myself, I hope it will be, without hesitation, received by the public.

"Perhaps it may be affirmed with certainty that there exists at last a conviction in the public mind that great pictures, properly finished, are the only pictures in historical painting to do effectual good to the art. But unfortunately, from the reasons before mentioned, a sufficient knowledge does not exist of the great expenses attendant on painting them : if there had been this knowledge, 3,000 guineas would not have been thought, as it has been by some, too large a reward for my last picture, in addition to what I have received from the exhibition of it. With deference to those who have thought the price excessive I positively affirm it will not give me a fair profit on the expenses of the time and labour bestowed on it, setting aside the effects of ill health. Notwithstanding the liberal prices I have had for all my pictures, the expenses of them have not been always cleared. An historical painter at first ought not to expect more ; but the time comes when a man, in order that he may be honest to others, must be just to himself.

"From the conviction of the national value of large pictures, it has been my constant determination to devote myself exclusively to their completion, and to refuse, however lucrative, all small commissions. It has been my earnest endeavour to lose no opportunity that occurred to strengthen by writing the growing appetite for art, under the belief that short papers, with the knowledge of an artist compressed in them, were a likely method of rousing the attention and interesting the feelings of those who, from their occupations, might not have time to attend to more important works, however much they might wish it, on the subject of painting. But it may be answered the sincerest devotion to a pursuit is no proof of talents to honour it ; certainly not. The question then is, Have I or have I not, displayed talents to justify my pretensions? Is my pursuit worthy encouragement or is it not? Do I or do I not, deserve to be encouraged? The public must decide.

"This is no longer a question between individuals, but between historical painting as an art, and the public as patrons of it ; and no man ought under an affectation of modesty to ask a price for a large work that will do no more than clear his expenses, and leave him for another picture in the same state of want, anxiety, wretchedness and impediment, through which all historical painters have hitherto finished their productions in this country. If he does this from an apprehension of otherwise getting no reward at all, he becomes instrumental in setting a pernicious example for all future purchases, of cramping the efforts of all those who may come after him, and who, instead of being benefited by what he has gone through, would have the same hill to mount, the same obstructions to clear away, and be in danger of rolling to the bottom when their courage had brought things to the same crisis as I have brought things now.

"If the English nobility and the English public consider historical painting essential to the reputation of the country ; if they consider that I, as one of its members, have displayed sufficient talents to do it credit ; if they are convinced that the works which are now before them give sufficient pledge of my consistency and perseverance, and that I have displayed sufficient firmness in the pursuit, so that they may calculate on a continuance ; and if they think it of any importance that I should have the power of continuing in it, is it too much to expect that they will now decidedly step forward, and, by the public purchase of my last picture, according to the plan sanctioned by the first men in the country, set an example for the future encouragement of historical painters, and put me in an honourable condition to keep up the respectability of my private character, and to proceed in the execution of a more important work?

"On the other hand, if they think me a personal obtruder on their notice, who makes pretensions which he has no talents to justify, who overrates the value of historical painting to the character of the country, and pesters the public for encouragement at a time when thousands are in want in other pursuits more radically essential to the interests of the nation, it is but just that their public rewards in art should be reserved for those whom they may think more deserving, and whose conduct may excite in its progress less prejudices than mine."

It is well known that the course of events was not altered by the address, in spite of its ability. Haydon was again and again imprisoned for debt, and suffered much misery until June 26, 1846, when he uttered the prayer from "Lear" for the last time, "Stretch me no longer on the rack of this rough world."

RAILWAYS IN SIAM.

ACCORDING to a correspondent of the *Glasgow Herald*, a large London house is backing Mr. Murray Campbell, of Singapore, who has tendered for, and is likely to secure, the contract for the construction of the railway from Bangkok to Kerat, and thenec to the banks of the great Me-Khong, the river which flows from Western China through the Shan territory and Siam, and it is therefore probable that all the material will go from this country. A strong German syndicate tried to secure the contract, but the offer of the English firm at Singapore was 200,000*l.* less than that of the German syndicate, or at the rate of 6,500*l.* per mile. It is to be a single line, standard gauge, and will be commenced at once, so that it may be completed by 1896. The capital is 1,600,000*l.*, and the royal family of Siam have subscribed half of this, and the remainder, with the exception of a small portion, has been subscribed otherwise. The Government guarantee 5 per cent. interest for ten years after the railway is constructed. This is the first outcome of the appointment of the Royal Railway Department under the Minister of Public Works. The line for the present is only to extend to Kerat, which lies in a populous territory to the north-east of Bangkok, but its extension on to Nonghai, on the Me-Khong, is a matter of time. The route has been surveyed and plans made. This line differs materially from that surveyed by Sir A. Clarke, which was to pass up the western side of Siam parallel with the frontier line between Siam and Lower Burmah. The Siam Government have almost decided not to guarantee this line, but were the Indian Government to make a railway from Moulmein to the Myawaddi, on the frontier line, to connect with Sir A. Clarke's proposed railway, it might induce Siam to proceed with it. Sir A. Clarke's line also reaches the Me-Khong river, and, were it constructed, a British company would extend it across the British Shan States to the Western China frontier. This, it may be said, is the alternative scheme to that recently before the Glasgow Chamber of Commerce, by which a line was to pass from Mandalay to Kunlon, on the Salween river; but even the projectors of the Siam-Burmah-China railway agree that the Kunlon line would immensely benefit British trade with Burmah. Mr. Murray Campbell is the concessionaire or contractor for the railway across the Malay Peninsula, which brings Bangkok three days nearer Europe.

CORRESPONDENCE

Building Rights.

SIR,—Can you or any of your readers help me in the following matter? I own property in the main street; the building is set back from the street, say, 10 yards. Many years ago the frontage was occupied as a garden. At that time the owner of an adjoining property purchased the right to restrain the erection of any building higher than, say, 5 feet. For a consideration he has allowed the adjoining owner to build upon his front land, and he agreed to give me the same privilege, which agreement he, a lawyer, now refuses to carry out. What I desire to know is, are there any precedents to show that, when the character of the neighbourhood has entirely changed as in this case, I should be justified in fighting an action to sustain my right to erect a building similar to my neighbour?—Yours,

Rochdale. WILLIAM HAILWOOD.

NEW BUILDINGS.

Newcastle-on-Tyne.—The foundation-stone of the new Home for Incurables, which is being built by the Newcastle Corporation as trustees of the Hospital of St. Mary Magdalene, has been laid. The following is a brief description of the new buildings:—The new Home for Incurables will provide day-rooms and wards for 68 patients, with accommodation for the staff of officials and nurses on a complete scale, and is planned on a semi-pavilion system, so as to impart to it more the character of "home" than "hospital." The corridors and staircases throughout will be of fireproof construction. The new home will be erected of bricks and faced with pressed red bricks from Hogarth & Co., of Choppington, dark red Normanby quoins to windows, and Prudham stone dressings. Messrs. Middlemiss Brothers, contractors, are carrying out the work, under the superintendence of the architect, Mr. Edward Shewbrooks, Mr. David Reid acting as clerk of works. The contract price is 12,668*l.*, and the total cost, including furniture, will be 15,000*l.*

Wakefield.—The walls of the Bishop's Palace at Wakefield are rising fast. Circumstances prevented the formal laying of a corner-stone at the proper time, but on Saturday last a memorial-stone was laid inside the chapel, in the north wall, bearing this inscription:—"Ad majorem Dei gloriam sumptus harum ædium conferendos necnon lapidem quem videtis ponendum curavit boni cujuslibet operis adjutrix indefessa A. M. Boyd-Carpenter, Episc. Riponensis uxor, Die 24 Oct. A.D. 1891." A specially-designed trowel of delta, with silver mountings and incised silvered inscription, commemorating the occasion on the ebony handle, was presented to Mrs. Boyd-Carpenter by the architect. The building is of "purpose made" red bricks, thinner and longer than usual, with special mouldings, the windows having stone sills and brick mullions. The covering is to be of Welsh slate. The plan consists of a porch with ceiling groined in brick, beneath a low tower of four storeys leading into an outer hall, and large central hall with staircase and lantern open roof. Out of this hall are entered the drawing-room, chaplain's room, library and chapel, and a gallery round leads to the various bed and dressing-rooms. At the top of the front stairs is a lobby which leads to the examination-hall over the chapel. The chapel is of Domestic character, with flat ceiling. The dining-room is next the kitchen wing. Accommodation is provided also for twelve candidates for holy orders, with a separate chamber for each, approached by a small staircase leading from the hall. The architect is Mr. William White, F.S.A.

CHURCH BUILDING AND RESTORATION.

Camberwell.—The Church of the Sacred Heart, Camberwell New Road, has been reopened after enlargement. The enlargement consists of an addition of about 26 feet to the nave, a baptistery and organ-chamber, with a choir-gallery and music-room, &c., new porches and two towers with lofty turrets. The works have been in hand since April last, and have been much delayed by the strike of carpenters and joiners; even now the turrets are without their roofs, and chairs have to be used instead of the permanent seats. The architect is Mr. Frederick A. Walters, of 4 Great Queen Street. The builders are Messrs. Thomas Gregory & Co., of Clapham Junction, S.W., Mr. J. Newton being clerk of works.

Denton.—St. Mary's Church, just opened, has been erected from the designs of Mr. J. P. Pritchett, of Darlington, in the Early English style. It comprises nave, 38 feet by 18 feet; chancel, 22½ feet by 12 feet; vestry at west end, 15 feet by 6 feet; organ-chamber, 9 feet by 8 feet, with heating vault underneath; and south porch, 8 feet by 6 feet. The nave is of four bays and the chancel of three bays, each containing a lancet window with buttress between. The east end has a triplet lancet window, and the west end has a rose window, surmounted by a bell gable. Externally the walls are built of Houghton Bank stone, hammer-dressed, with chiselled dressings of the same. Internally the walls are lined with buff bricks from Normanby brickyard, with stone dressings to jambs and arches. The roofs are of pitch-pine, unvarnished; that of the nave being open to the ridge and covered with boarding; and those to the chancel and organ-chamber being waggon-headed with moulded ribs, and the whole are covered with brown tiles, from Ruabon in Wales, laid on felt. The lectern is the gift of Mr. John Proud, of Bishop Auckland, from a special design by Mr. H. D. Pritchett—as a memorial to the late Mr. John Marley, of Darlington. The whole has been carried out under the supervision of Mr. Pritchett, assisted by his son, Mr. H. D. Pritchett, by the following contractors:—Masons' work, Mr. T. Boyd, of Stapleton; tilers' work, Mr. J. Wandless; joiners' work, Mr. Franks (except lectern, which was made by Mr. Hobson); plumbers and glaziers' work, Mr. R. Smith; and painters' work, Mr. T. Metcalfe, all of Darlington.

GENERAL.

Lady Carnegie, of Crimonmogate, has announced her intention of giving to the Peterhead Public Library a series of fine plaster-casts, reproductions of ancient statues. They include *The Venus de Medici*, *The Fighting Gladiator*, *Hercules*, *Apollo*, *Ceres*, *Mercury*, *Antinous*, *Adonis*, *Diana* and others.

The Opening Conversazione in connection with the present session of the Paisley Art Institute has been held in the Museum Buildings. Mr. J. Caldwell, president, presided, and an address was given by Mr. Francis H. Newbery, Glasgow, on "Some Popular Errors about Art and Artists."

The Second Annual Exhibition of the Lanark Art Club has been opened by the president, Mr. Thomas Watson, jun. About one hundred works are exhibited by members.

Mr. Harold T. Burgess and Messrs. Spalding & Cross, London, have been appointed by the Coventry City Council as joint architects of the new baths.

Professor Baldwin Brown, M.A., of Edinburgh University, will give an address, entitled "Some Notes on the Growth of Cities," on the occasion of the opening of the session of the Dundee Institute of Architecture, Science and Art, on Wednesday, November 4.

Sir Douglas Galton has been invited by the Sindaco of Florence to investigate the sanitary condition of Florence and to suggest improvements.

The Architect.

THE WEEK.

The opening meeting of the Institute of Architects took place on Monday evening, under the auspices of the new president, Mr. MacVicar Anderson. The attention with which his address was listened to is evidence that the President, while previously discharging the duty of honorary secretary, threw himself thoroughly into his work, and from long experience knows what the Institute might accomplish for the profession, and, what is of equal importance, for the public at large. The position of affairs has been, however, to a certain extent defined, if not limited, by the course of recent events and by existing circumstances. So it was probably no easy matter to outline principles for future guidance of the members, and not hint that there were weak points to be amended. The President at the outset urged that attendance at the meetings should be more honoured in observance than, as hitherto, in the breach. It might have been added that, previously, the Institute owes something to the members of the Architectural Association for swelling attendance at meetings chiefly devoted to papers read by those versed in art, science and crafts indirectly connected with or subsidiary to architecture. The President alleged that he did not personally expect to be equal to others who might have occupied the chair, but he would hesitate at no sacrifice to do the best in his power for their interests. If attending the meetings involved sacrifice, he urged that some sacrifice should be made. Of late years the Institute, in casting about for a *raison d'être* to claim professional and public support, has among other matters elected to take a stand as an examining body, and recently the action of the Architectural Association has indirectly caused this to appear as a cardinal item on the Institute programme. It is needless to say that the President handled this topic ably, but it involved opening the question of finance. Here came the difficulty of avoiding an appeal *ad misericordiam*. Many members of the architectural profession, and a large majority of the public, fail to see respectively what particular advantages or benefits the Institute of Architects during its long existence has conferred on them. What the present President has already effected during his short tenure of office is far more likely to bring about increased membership, and consequently more funds to the treasury, than any expounding of benefits which so far mainly have only been attempted theoretically. One instance of tact, supplemented by business aptitude and technical experience, is seen in the conclusion of the prolonged and obstinate late trade dispute, where perhaps only too many of the ablest would have failed to bring about peace. The discussion in regard to the objectionable structure at Somerset House terminated in the agreement to notify in the proper directions that objection had been taken to the addition, which it was stated would be received with attention, and probably effect the desired object. Some ardent spirits thought that the resolution should be highly spiced with adjectives of a warlike and aggressive character, while others who were in their own opinion better informed than those who had got at the facts, advised memorialising in other directions according to their pet fancies. The President, in acknowledging the congratulations that greeted his address at the finish, alluded to their meeting for the first time with the electric light in the hall, and hoped it was a happy omen for the future. The numerous lights are so toned down that they produce something akin to the dim religious light of the sanctuary, so dear to certain persons who, it can hardly be said, listen to sermons they are supposed to be hearing; a soothing light that, aided by papers of an unexciting character, may have like results at future meetings.

The arrangements for the meetings of the Society of Arts during the ensuing session have been announced. The first meeting will be held on Wednesday, November 18, when the opening address will be delivered by the Attorney-General, chairman of the Council. On the following Wednesday evenings previous to Christmas papers will be read on "The Measurement of Lenses," by Professor Silvanus P. Thompson; on "The World's Fair at Chicago in 1893," by Mr. James Dredge; on "Secondary Batteries," by Mr. G. H. Robertson; and on "Spontaneous Ignition of Coal and its Prevention," by Professor Vivian Lewes. The first of a series of Cantor Lectures will be delivered by Mr. A. P. Laurie on "The Pigments and Vehicles of the Old Masters," and will consist of three lectures, commencing Monday evening, November 30. Among the following courses are lectures on "Electrical Distribution," by Professor Forbes; "The Uses of Petroleum in Prime Movers," by Professor W. Robinson; "Mine Surveying," by Mr. B. H. Brough; and "The Chemistry and Bacteriology of the Fermentation Industries," by Mr. Percy Frankland. A special course of lectures has also been arranged, under the Howard Bequest, on "The Development and Transmission of Power from Central Stations," by Professor W. Cawthorne Unwin, F.R.S., commencing shortly after Christmas.

The report of the Council of the Society of Architects records a satisfactory year's work. Thirty-one new members have been added, but as two members have died and nine have resigned, the net increase is twenty. At the first Council meeting of the session a policy of improving the organisation and extending the influence and giving stability to the Society was entered upon, and has been steadily persevered in. Local secretaries, who had previously been appointed in only two provincial centres, were nominated for all the principal cities and districts of the country and for several of the colonies. The question of the establishment of branches at two important colonial centres of the Society is receiving consideration of the Council. A series of conditions upon which such branches should be formed was drawn up by the Council, and submitted to a general meeting held in February, as was also a suggestion, made by one of the local secretaries, for the division of Great Britain into districts, each to have its own committee and secretary. At that meeting the principle of the formation of branches of the Society in the colonies was approved, and the detailed arrangements were referred in each case to the Council, subject to confirmation at an ordinary meeting; and approval was also given to the principle of the division of the country into districts, this matter, however, being referred back for further consideration and report. The pursuance of the same line of policy has, later in the session, led the Council to advise the Society to seek incorporation, and with this view they have caused both memorandum and articles of association to be very carefully drafted, the former setting forth more completely than has hitherto been attempted the objects for which the Society has been founded and reserving powers for their accomplishment, while the latter comprise the present rules of the Society, with many alterations and additions, such as experience and the growth of the Society show to be necessary. These were submitted to the members at the annual general meeting in June, and, with certain amendments, adopted, it being left to the Council for 1891-92 to carry out the reforms thus inaugurated. Arrangements have been made for obtaining a new lease of the premises now occupied at St. James's Hall. As in former years, private members have from time to time sought the advice of the Council upon difficult matters which have arisen in the carrying on of their practice, and such advice has always been given, after most careful consideration of all the points involved, by the Practice Committee and the Council.

The Gainsborough Local Board have had a return of courage, and while in that mood decided not to allow the arrangements for erecting market buildings and corn exchange to lapse, through fear of interference with the light and air of the owners of adjoining property. Recently a resolution was passed against the building. Since that time the Board have obtained advice from architects and surveyors which determined them to erect the buildings. If damage arises, which is doubtful, the amount of compensation that would be awarded need not scare the inhabitants.

HOSPITAL CONSTRUCTION.

IT is not often the arrangements of a public hospital are investigated by a Parliamentary Committee, and on account of the novelty, if for no other reason, some of the statements of the physicians before the inquiry concerning the Sydney Hospital are worth noticing. Last week we gave an account of the difficulties which arose through the entire absence of information about the cost of a new building, and which have caused the works to be suspended during several years. But there is a constructive interest as well as a financial one in the affair which is worth a brief consideration.

As we have already mentioned, the principal part of the old hospital was taken down because it was supposed that the walls, being affected by hospitalism, became a source of danger to the patients and interfered with the treatment of surgical cases. There seems to be little doubt that the danger was exaggerated. Dr. RENWICK, the president of the Board of Directors, said in his evidence that the popular outcry about the hospitalism was a mistake, that the difficulties of treatment were imaginary, and that if hospitalism existed, the removal of the plaster and the boarding would have been amply sufficient. But he denied that nowadays there were any grounds for apprehending danger from hospitalism. It was, he declared, "A thing of the past in every well regulated institution; for since the discovery of antiseptic methods of treatment, operations under circumstances which were formerly impossible are now carried out with the best possible results." Dr. RENWICK referred to Sir DOUGLAS GALTON as authorising the belief that "hospitals could now be built to almost any height without any danger of hospitalism, because of the perfectly preventative nature of the antiseptic treatment." On being asked by another doctor, who was a member of the Parliamentary Committee, whether there was not risk in crowding the sufferers from different diseases into the same building, Dr. RENWICK replied, "Not if they are properly separated; if the wards were kept free from each other, with an air-space between, there would be no danger." Finally he said he had not the slightest apprehension that disease took hold of a large hospital. Another witness who gave similar testimony was Mr. H. D. RUSSELL, who has been for fifteen years secretary of the Sydney Hospital. The following is an extract from his examination:—

You say you are in favour of large hospitals for the sake of economy, but do you think it is a good thing to have tier upon tier of patients?—Yes. Seven or eight years ago, the greatest authority on hospital construction, Captain Galton, met an audience who were interested in hospital construction, and he then told them that his ideas as to hospital construction had all been revolutionised since he had had a conversation with Professor Lister, who assured him that by the new system of surgery there was no danger whatever of hospitalism, that hospitalism was due to bad surgery—that was the old style of surgery—and that with the new style of surgery there should be no such thing as hospitalism, and that you could build tier upon tier of wards in a hospital with benefit to the patients rather than otherwise. Since then there has been no hospitalism in any hospital in England—that is, within the last seven or eight years.

Was not Lister an enthusiast about his own discovery?—Yes; and others followed him and adopted his views.

Admitting to the full the value of his antiseptic system, about which there can be no dispute, will there not be still exhalations from diseased patients, and is it wise to allow the atmosphere from the lower storeys to reach the upper storeys?—There should be no exhalations in a well-ordered surgical hospital.

Are not your staircases and lifts inside this building?—The lifts will be inside.

Are not the staircases inside?—But there is no communication from the wards to the lifts.

Not from side doors?—No.

Nor to the staircases?—No; the hospital is so constructed that there shall be no communication from one ward to another.

Do you think that no exhalations could pass from the lower to the upper ward even if blown out of the windows?—No; I do not believe there are such things. The hospital system of surgery is too cleanly to admit of that. In the old days it was very different. I can remember when the Sydney Hospital was stated to be hospitalised. In those days I have known surgeons to admit cases of erysipelas into the accident wards. I have known patients in the erysipelas hut to be nursed by the nurses of the accident ward. They used to go backwards and forwards from one place to the other. The utensils in the erysipelas huts were brought into the accident ward, and the consequence was that erysipelas was rife in the wards; but of late years nothing of that sort has been done, and there is no erysipelas now.

Do you think that that bad state of things was owing more to defective management than to the condition of the building itself?—It is owing to what is now called dirty surgery.

Do you think that if the front of the old hospital had been properly cleaned, and if it had been managed properly, it need not have been pulled down?—Yes; it was pulled down in error.

Through not knowing how to manage the hospital?—Yes.

Then ignorance has been the source of all the trouble about reconstructing this hospital?—It has had a great deal to do with it, I believe.

The liability to hospitalism, of course, may be said to determine the number of storeys in a hospital. Doctors, however, differ among themselves on that question as on many others which are of similar importance. Hence we find Dr. MACKELLAR, who was at one time medical adviser to the Government, saying that "all modern teaching on the subject would have us believe that hospitals should not be constructed more than two storeys high, and for purposes of administration it is clear that it would be more convenient to have two storeys only." The antiseptic treatment, which by some is supposed to make the highest hospitals innocuous, was not considered by Dr. MACKELLAR to be an infallible or an universal guarantee of safety. As he said, "The antiseptic system may be carried out in its entirety by those who have charge, or it may not—that would depend on the whims of the person who carried it out. I do not think that you could rely on that as a reason why the building should be more than two storeys high." Dr. BOWKER, who like most of the physicians that gave evidence is a member of the legislature, said it was ascertained by the great HUNTER that more people died under exactly similar circumstances in upper wards than in lower wards. It was stated that Miss NIGHTINGALE had approved of the plans for the lofty hospital in Sydney; but, according to Dr. BOWKER, that lady is distinctly of opinion that one-storey hospitals are more conducive than others to the recovery of patients. Dr. MILFORD, who has practised in Sydney since 1858, considered it to be important that there should not be more than two storeys in height. He admired the Tollet system now being used in France, of which he gave the following description:—

Pavilions of one storey, 25 feet high, supported upon a series of arches which are from 12 feet to 14 feet high. Then there is a wall composed of wrought-iron pillars at intervals of 5 feet, with brickwork in between. The roof finishes in a pointed Gothic arch, and is also made of brickwork, lined inside with plaster, and the plaster is painted. The flooring is of pine boards, and has concrete or cement underneath. The roof is covered with tiles and concrete, and comes up into an arch to allow a free current of air to pass upward, and thus proper ventilation is secured, which is advantageous to the patients. These hospitals can be cleansed either by flame—for they cannot be burnt—or by water. Then the corners of the rooms are rounded so as to have nothing to stop the free flow of air. The walls are hollow to allow of the passage of air up through them, and there are openings in them at intervals of 4 or 5 feet below and above, with valves attached so as to allow the air to enter only below and have exit above.

It was also remarkable to find that Dr. MILFORD was without any faith in the immunity of the old hospital from danger. He said it was "full of hospitalism, and cases of erysipelas and pyæmia originated constantly in the wards." Such contrary results of observation will not surprise anyone who has had a little experience of medical practice.

While so many physicians advocated the construction of hospitals not exceeding two storeys in height, it was, we suppose, only natural that the medical staff of the Sydney Hospital should appear in support of the design which originally represented three storeys above the ground floor. In a statement in support of the design which was presented to the committee it was said:—

With respect to the objection to the height (four storeys) of the pavilions, the staff would, in the first place, point out that the objection had very special weight in days in which the enormous advantages of lifts or elevators were unknown. Since the introduction of these appliances, with which all the pavilions of the hospital as planned are to be provided, more than half the force of this objection to buildings of the contemplated height has been removed, the conveyance of patients and stores from floor to floor being made an easier, and, in the case of patients, a less irksome matter than the travelling through very lengthy corridors. As far as economy of administration goes, the arrangement in four storeys has a decided advantage over any less height; as far as the transport of patients is concerned it has an advantage, and there remains only the purely sanitary aspect of the question. It must at once be granted that to crowd very lofty buildings on a restricted area would be an unwise course to pursue, since such an arrangement must interfere more or less with access of free light and moving air, two most important elements of health. It is, for instance, obvious that to surround a relatively small quadrangle with lofty buildings so as to create a pool of stagnant air and to interfere with the admittance of sunlight would be a serious error.

This would be especially true in a climate damp and comparatively sunless, and in a closely pent city site. But these objections do not in any wise apply to the plan of the Sydney Hospital, which has been so arranged that each pavilion is completely free and open on both sides, and they still less apply in a climate where, as in ours, the amount of sunlight during the year is so great.

It may be here pointed out that some of the largest and most important, and one at least of the newest London hospitals, have been built of at least this height without any ill consequences in a climate where the degree of sunlight is perhaps one-fourth of that which we enjoy. St. Thomas's, St. George's, St. Bartholomew's and the London are all of them of four, and, here and there, of five storeys.

It will be observed that nothing is said about the risk of the transmission of disease from floor to floor, but the representative of the medical staff in his evidence stated that he was without fear on the subject, especially as the openings for the lifts were entirely separate from the wards.

In considering the subject, the convenience of the medical staff of a hospital must be considered as well as the needs of patients. Questions of cost have also to be kept before the mind. There is no doubt that at one time patients in the upper storeys of a large hospital were not always certain to be regularly visited by the principal physicians, but since lifts have been introduced there are fewer obstacles to ascent, and the objection to several storeys on that account is less weighty. Besides, in large towns it is not always feasible to obtain sites which would allow of many two-storey pavilions, and the advocates of the system have to be content with a vertical rather than a horizontal disposition of wards. But in places where land is available there are many reasons for low buildings. The French sanitarians of late years have adopted them, and they are not wanting in science or in the skill of drawing sound conclusions from evidence. Even in Sydney there were few ready to speak against low pavilions. Dr. Maher expressed a common opinion when he said that four-storey hospitals were not disadvantageous if lifts were used, and that the rising of infection from ward to ward was more a theoretical than a practical objection, but, he added, "if you had space enough, it would be just as well to have all the patients on the ground floor."

THE INSTITUTE OF PAINTERS IN OIL COLOURS.

THE ninth exhibition of the Institute of Painters in Oil Colours is one of the most attractive that has been seen in the Piccadilly galleries. Among the six hundred and thirty works which are hung this year there are very few which are unsatisfactory, and the Council can be congratulated on having secured so excellent a collection. The landscapists have, however, continued to secure the larger share of the wall-space, but few visitors will regret the arrangement if it has caused the exclusion of portraits. There is no doubt that portraiture is one of the most important branches of painting, but of late years it has been overdone, and it is hard enough on the public to have to suffer the infliction of gazing at the likenesses of a horde of nobodies once a year at Burlington House. It will be generally admitted that the pleasure afforded by the exhibition in Piccadilly is in a great measure owing to the very limited number of portraits that are to be seen.

In the West Gallery the *Old Fishing Village in Sussex*, by Mr. C. J. Lewis, may be said to suggest the general character of the exhibition, that is, the predominance of landscapes which from their interest seem to be discoveries of unused scenes, and show, too, that England is not exhausted. Quietude seems to reign over the little village and the smooth water which no wave disturbs, and where the gulls alone are animated. But the agreeable horizontality of the place is disturbed by an unnecessary tree which is introduced for contrast. The purchaser of the picture will do well to insist on the tree being painted out. It is astonishing how many English artists continue to believe that painting the lily is not a wasteful excess. *Common Land*, by Mr. Clayton Adams, is a delightful little work, the clumps of bushes being finely contrasted. It is on the lowest line, where many of the best cabinet pictures are to be found. It is hard to say which part, the architecture or the figures, is better painted in Mr. Pike's *Canaletti and Tripolo*, in the Piazza, Venice. He shows the angle of the Ducal Palace, with the arcades and the adjoining Porte della Carta as a background to the brightly-dressed figures, among whom the two artists appear. The picture is one of the successes of the year. Mr. David Murray has a true, if dull, view of the *Rother at Pulborough*. The trained skill of Mr. F. A. Bridgman, the American artist, is seen in three pictures of Eastern scenes, which are good examples of his fidelity to nature and his admiration for light and shade. The *Fellahine and Child* and *New Shoes* will be found in the West Gallery. Mrs. Lea Merritt has painted the head and bust of a muscular but unbeautiful woman, and calls it *Atra Cura*. To justify the title, dark wings are introduced about the head and shoulders. The handling is powerful, and the whole style seems in keeping with the model. Mr. T. Pyne has a fine view of the *Ferry at Burpham*, with a distant view of Arundel, which John Constable considered to be one of the most wonderful parts of England. Mr. Fantin Latour's Flower Pieces always give delight, and there are two of them in the room. Mr. Yeend King's *Mill Pool* depends for interest on the green trees and deep grass that encompass the water, for figures are as absent as the mill itself. We are glad to say Mr. Kennington has this year forsaken miserable children, and his *Mischief* is more pleasant to look up, and is no less creditable to his talent. Mr. C. Earle has hit upon a good subject in his *Cider Mill*, for the red apples lying in the foreground and on the branches give colour that no old house or water-wheel could afford. Mr. White, in *Starting a Race*, shows a village scene with a man-of-war's man as handicapper, the prize being some fruit which he carries. The picture is of a kind that is popular in England. The *Rob Roy* of Mr. Lockhart Bogle is not so striking a barbarian as the Piper he exhibited at the Royal Academy, but there is the same red tartan and general reddishness. It is needless to say the figure does not correspond with Scott's reiver, for painters have not the courage to realise the description in the novel. At a distance the *Pythia* of the Hon. John Collier might, from the pose and subject, be taken to be a work by Sir F. Leighton; but on near examination it is found to lack the president's refinement and beauty of contour. It is better, however, than most of Mr. Collier's works, and shows a restraint he rarely exercises. Mr. East has only one landscape this year—a *Dewy Morning*, in which a hazy light envelopes trees and water. The elements are simple enough, but the style elevates them.

In the Central Gallery there are several attractive works that are mainly of cabinet size. Mr. Mouat Loudan, in *Five o'Clock at the Temple Gardens*, has painted a group of London children not without the aid of imagination. Mr. Heath Wilson depicts the massive unfinished Doric temple, with its unfluted columns, in his *Egesta*, and the ruin seems like a work of giants if compared with the representations of modern life and objects. Sir J. D. Linton presents a richly-clad girl as *Jessica*, but the face does not correspond with the ideal daughter of Shylock. *The White Rabbit* seems like an experiment in colouring of another style, for we see a darkened room like a kitchen, or out-house much neglected, in which a little girl sits dreamily and feeds a rabbit. The picture is finished with the utmost care, but so much labour might well be expended on a better subject. The West of Galway has been an inexhaustible field for Mr. Waterlow, and the *Summer Sea* and *Bloom of Spring* reveal the beauty of the region. It is strange that Irish artists are not to be found who are competent to paint such scenes in a manner that would satisfy the committee of an English exhibition. Mr. Watson Nicol takes up an old subject, a lover holding a skein of thread, and seated on a very low stool. Seventeenth-century is adopted for the pair. The *Goat Herd* of Mrs. Stokes is a child who knits while leading her charge along a mountain path. Very quiet colours are used, and in consequence the red kerchief around the girl's head becomes effective. The colours are laid on in a way which marks a practised hand. Mr. Frank Dadd's *Thirdly and Lastly* represents an old man in a parson's black gown going through a dialectic performance with a layman over a bottle. But from the expression on the face of the latter it might be supposed that he had been just informed that the logician was a highwayman in disguise, and sought after a pecuniary con-

clusion. Mr. ROBERT MORLEY happily sees the fun of some sorts of animal life, and his *Yoicks, Tally-ho!* a pair of young frogs pursuing a beetle, is worth a dozen hunting pictures. Mr. J. C. DOLLMAN'S *Malade Imaginaire*, a young lady in a bath-chair surrounded by admirers, is so terribly correct and new in the costumes that it would serve as the model for the show-plate of an enterprising tailor. The figures are characteristic of modern life in holiday times, and hereafter the work would be a historical record.

In the East Gallery Mr. COTMAN'S *Mill Stream* is one of the works that is sure of admiration. That artist prefers river scenes, but this is a new experiment. The point of view is from a hill, and we look down on the red-tiled roof of the mill, and the winding stream, which is crossed by a bridge in the middle distance. The water is perhaps of too light and hard a blue, but the whole scene is remarkable for its brightness and the power seen in the combination of the parts, as well as in the perspective. On the opposite wall is a painting which is no less successful, the *Breath of Autumn*, by Mr. PICKERING. The subject in this case, too, is simple, only a group of trees near a marshy pool, and a sky which is ominous with the lurid light that often portends a storm. But the parts are all treated with a vigour and knowledge that make the picture at once impressive. Mr. STOCK'S *Sleep and Twilight* is a nude figure gracefully disposed, and as well painted as can be expected in a country where such subjects are not encouraged. Mr. HARGITT suggests some of the rich colour which pervades the Isle of Wight in his *Niton*. Mr. AUMONIER, like several other artists, has gone to Sussex for a subject, and his *Hastings* shows a fine sketch of country with hills bounding it. It is among the works which uphold the supremacy of landscape in the exhibition.

GRANTS OF WATER.

THE number of the Journal of the Royal Society of Antiquaries of Ireland which is in course of distribution to the members is of varied interest. Among the communications is one on "The Water-supply of Ancient Dublin," by Mr. H. F. Berry, M.A., which goes back to A.D. 1244, when the Justiciary issued a warrant for an inquisition by twelve free men as to a source of supply for the city. Many of the extracts will be novel to hydraulic engineers. The following extract can be appreciated by readers who may not be acquainted with the topography of the Dublin district:—

According to a memorandum in the "Liber Albus," the prior and convent of the Holy Trinity, on the morrow of the Festival of St. Leonard the Confessor (November 6), 39 Henry III., are stated to have received water from the cistern of the citizens ("aquam de vase civium"), which is described as being situated opposite the Tholsel near the gate of the priory of the Holy Trinity. This supply would appear to have been furnished to the priory in pursuance of an agreement made between the city and the prior and convent, dated Thursday next after the Festival of St. Petronilla (October 30), 39 Henry III. The waterworks, in pursuance of the King's writ of 1244, should have been completed within the city walls about this period, and the very special memorandum above indicates that on November 6, 1254, the new supply of water was for the first time permitted to flow within the precincts of the splendid monastic foundation close by the conduit.

About the same time a grant "as perpetual alms" was made by the Mayor and citizens to the Church of the Holy Saviour near the Bridge of Dublin, and the friars preachers there, pursuant to which they were allowed portion of the city water, which was to be taken within the walls of the new gate near the house of William the Clerk, the friars attaching their pipe to that of the citizens at this point, and to have liberty to lay it through the land of the city as far as their house. In this instance (the monastery having occupied the site of the present Four Courts), it was necessary to bring the pipe across the river, and this the friars were to accomplish without injury to the bridge. The diameter of the friars' pipe was to be 5 inches, and within their house it was to be so narrowed that its opening might be stopped by the insertion of a man's little finger. The friars were to keep up the pipe at their own expense, and the Mayor and citizens agreed that should they be at any time molested in respect of the city conduit pipe, the Archbishop of Dublin, by stopping the pipe where it crossed through his lands, might restrain the citizens.

This grant is undated, but owing to the fact of its being witnessed by Luke, Archbishop of Dublin, who died in 1255, and by Richard de St. Martin, Dean of St. Patrick's, who held the Deanery from 1250 to 1260, there is every probability that it was made in 1254, and that the House of the Friars Preachers became indebted to the new water supply at the same period as the Priory of the Holy Trinity.

Robert de Assebourne, Mayor of Dublin, allowed the friars to lay the pipe of their conduit through his lands, which extended to Gormund's Gate by the wall, and the community was authorised to dig in his grounds and to mend the pipe when necessary. This grant is also undated, but de Assebourne was Mayor 1261–63.

A citizen named William le Devenys (who was Remembrancer of the Exchequer), was granted in 1290 a supply of water from the conduit through a pipe of the thickness of a goosequill, which was to be taken from the city pipe within the new gate, and to be brought at his cost to the stone house that belonged to William Picot. Shortly before this, in 1287–88, a right to some of the city water had been vested in Sir Richard of Exeter, knight, which was to be conveyed to his premises through a pipe of dimensions similar to that last mentioned, and a transfer of this right made by his son Richard to Henry le Mareschal (Mayor of Dublin in 1281) was confirmed by the Corporation, on account of "its usefulness to the vicinity." The confirmation stipulated for the water being taken from the city pipe towards the corner that extended to Kilholmok Street, and conveyed to Le Mareschal's house near Holy Trinity Church at his own cost, while a portion of the supply was permitted to be taken from his cistern for the use of the neighbours: the supply of this crystal stream would seem to have exercised a poetic influence on the grantors, as they imposed on Henry and his heirs the presentation to the Mayor and his successors on every Feast of St. John the Baptist of no less an offering than a "chaplet of roses."

In the person of one William, this same family of Le Mareschal had a demise of ground in the immediate neighbourhood of the reservoir already alluded to, the terms and local designations in which are of interest. In 1320 he was granted a plot between the wall of St. Thomas's Abbey and the curtilages of divers citizens in Thomas Street, which extended in length from the abbey gate as far as the city cistern of the watercourse towards the west, and thence as far as the place where the watercourse crossed; and in breadth, between the ground of Robert Rowe from the north and the ground of the canons of the said abbey from the south; and in length as far as the small cross that stood in the raised way towards Kilmainham, together with the fosse towards the north near the gate at the Barrs. Le Mareschal was allowed to conduct and discharge any overflow water through the fosse, and the service by which he held this grant was of a much more practical character than the ornamental one assigned his kinsman in the preceding one—he became bound to sustain efficiently at his own cost and labour the common city watercourse from the last place at which that water was turned aside towards the city as far as the city cistern near St. Thomas's Abbey.

In 1323 we find a rent of 6*d.* yearly charged to Walter de Istelep for a supply from the cistern near St. Michael's Church in the High Street, the water being brought in a pipe of the diameter of a goosequill through the middle of the street on the opposite side to Master Walter's house, and for 1*d.* rent in 1329, Nicholas Fastolf and Cecilia his wife were allowed a reasonable supply from Master Walter's cistern in the parish of St. Nicholas, the pipe to run through Rochelistreet, to their residence.

The Fastolf family were further permitted to have all their tenements in the same parish supplied with water through the pipe, and they had leave to open the street for the purpose of laying it and of repairing the conduit when necessary. The Corporation of Dublin, solicitous at that early period, as in these latter days, that the citizens should be put to as little inconvenience as possible by the opening of the streets, thoughtfully added a proviso that the work should be "speedily done," and that the Fastolfs should repair the street and sufficiently pave it at their own cost. The constant proviso in these grants as to the pipes being of the diameter of a goosequill will have been noticed, and it proves that in such cases the water was kept continually flowing, and there must have been tanks or vessels to receive it.

In 1458 the House of St. John without the new gate was granted the running water and its course from the small house called "le water-house," near Crokker's Barrs, passing through Thomas Street, and by the House of St. John the Baptist, so far as the water-mill of that hospital; the Mayor and commonalty, as of old, to be supervisors and governors of the water, and, in case of need, to have power to divert it to fill the city ditch.

By a Concordatum made by the Lord Deputy in Council on November 22, 1533, the rent was to be paid by the Vice-Treasurer out of the King's revenues to the Mayor, bailiffs and citizens of Dublin, in compensation for the rent of the watercourse, which had been paid by the Prior of St. John's until the dissolution of that house, when the watercourse became common.

Accustomed as we now are to a plentiful supply of water at

high pressure, and in cases of fire to the services of a skilled brigade, the primitive appliances and equipments provided against such emergencies by the civic authorities would seem wholly inadequate, and the chief of our City Fire Brigade might well be dismayed at the clumsy contrivances held in readiness for grappling with outbreaks of fire in the days of the Tudors. Twelve graps of iron for pulling down houses that might chance to be on fire and eleven buckets of leather for carrying water were ordered to be made, and the Mayor was bidden to see to the matter with all speed.

FOOTPATHS AND PUBLIC ROADS.

JUDGMENT has been given in the case Wilson *v.* St. Giles's Vestry, Camberwell, which raised an important question as to whether an ancient footpath and a new roadway can together be treated as forming a "new street" within the Metropolis Local Management Acts of 1855 and 1862.

Mr. Justice Charles, in giving the joint judgment of himself and Mr. Justice Cave, said :—In this case the appellant was summoned under section 105 of the Metropolis Management Act, 1855, before a metropolitan magistrate, to recover a proportion of certain paving expenses which had been incurred by the respondents in paving part of a road bounded on the east by a row of houses, three of which belonged to the appellant, and on the west by an open space called Camberwell Green. Whether the respondents could recover or not depended on the question whether this road was a "new street" within the meaning of the Metropolis Management Act, 1855 (18 and 19 Vict. c. 120, s. 105, and the Metropolis Management Amendment Act, 1862 (25 and 26 Vict. c. 102, s. 112). The road in question has on the west side the open green, and on the east there is a footpath which on January 1, 1856, when 18 and 19 Vict. c. 120 came into operation, was repairable by the inhabitants at large, and which has been from time to time since that date repaired at the ratepayers' expense by the respondents. The footpath was undoubtedly a "street" within the definition given in section 250 of the Act, and vested in and came under the management of the respondents under section 96. The roadway of the road has never been repaired by the respondents, nor had the management ever been assumed previously to the passing of the Act of 1862 by the authorities having control of pavements and highways in the metropolis. In 1873 the respondents tar-paved the footway, in pursuance of a vestry resolution, at a cost of 25*l.*, which was charged on the ratepayers generally. Tar-paving is not considered by the respondents to be "permanent" paving as distinguished from asphalte, and the magistrate found as a fact that it was in the nature of repairs of a temporary character. He also found that all other repairs which had been done were temporary only. On March 19, 1890, they passed a resolution whereby, after reciting that Camberwell Green Road was a "new street," as defined by the Metropolitan Management Acts, and not paved to their satisfaction, and that it was expedient to pave it completely, it was resolved that it should be so paved, and that an estimate and apportionment of the expenses should be made. This estimate was afterwards made and approved, and the apportioned amount demanded of the appellant according to the provisions of section 105 of the Act of 1855. He refused payment, and thereupon these proceedings were instituted. The magistrate held that the road, both carriage and footway, was a "new street" within the Acts, and that the appellant was liable. He accordingly ordered payment of the sums claimed, subject to the opinion of this Court on the question whether he was right in point of law in holding the road to be a "new street." Now in the earlier statute, although the term "street" is defined by section 250, the term "new street" is not, and whether a street were a "new street" or not seems to have been treated in each case as a question of fact. But by section 112 of the Act of 1862 (25 and 26 Vict. c. 102) it is enacted "that the expression 'new street' shall apply to and include all streets hereafter to be formed or laid out, and a part of any such street, and also all streets the maintenance of the paving and roadway whereof had not previously to the passing of this Act been taken into charge and assumed by the commissioners, trustees, surveyors, or other authorities having control of the pavements or highways in the parish or place in which such streets are situate, and a part of any such street, and also all streets partly formed or laid out." It is also thereby enacted that the word "pave" shall apply to and include the formation of the roadway or footway of any street. It was contended by the appellant that the footpath should have been treated as distinct from the roadway, and that, assuming the roadway to be a new street within the Acts, the footpath was not, inasmuch as it had been paved, repaired and taken in charge prior to the Act of 1862 by the public paving authorities. And it certainly does appear somewhat strange that an owner whose premises abut on a public footway repairable by the inhabitants at large, and which has been repaired by the public authorities at the ratepayers' expense, should afterwards be called on to pay a proportion of paving expenses in respect of that footpath simply because the paving authorities resolve to treat it together with a roadway which has not been repaired or taken in charge. But, after a careful consideration of section 112, we are of opinion that Camberwell Green Road, treated as a whole, does come within the definition there given of "new street." It is, when so regarded, "a place the maintenance of the paving and roadway whereof had not previously to the passing of the Act of 1862 been taken into charge and assumed" by the paving authorities. The paving of the footway had been taken into charge, but not of the roadway, and this street accordingly comes exactly within the words of the section. To remove it from the category of "new streets," both footway and roadway must have been taken in charge and assumed. And there is nothing, in our opinion, to prevent the authorities from treating the street as a whole, although the footway and roadway are both "streets" within the definition clause. On the contrary, we think the section contemplates that streets should be so dealt with. It may be observed that section 150 of the Public Health Act, 1875, furnishes an example of similar legislation. Under that section the frontager on a street may have liability cast upon him, even although a part of the street consist of a footway repairable by the inhabitants at large. It is, however, suggested that the case of "The Vestry of St. Giles's, Camberwell, *v.* Hunt" (56 "L. J." M. L. 65) is a decisive authority in favour of the appellant. There a local authority had in 1876 paved out of the general rates the footpath of a new street. Ten years later they resolved to pave the same footpath again, under section 105 of the Act of 1855, at the expense of the adjoining owners. It was held that they could not do so, on the ground that they had already exercised their powers under that section over exactly the same place. No such question as that now raised arose. The magistrate, moreover, in that case found that the paving done in 1876 was, and was intended by the vestry to be, of a permanent and not of a temporary character, and had been done under section 105 of the Act. In the present case the magistrate has found that the work done on the footpath was temporary only—such, in fact, as would be done to a highway under section 98 of the Act of 1855, and not under section 105. The case referred to, therefore, is distinguishable and is quite consistent with the conclusion at which the Court has arrived. The decision of the magistrate must be affirmed, and this appeal dismissed with costs.

THE MACKARNESS MEMORIAL.

A MEDALLION with the head of the late Bishop Mackarness of Oxford has been placed in Christ Church Cathedral on the south wall of the south aisle, adjacent to the memorial to the late Prince Leopold. The medallion, which is of silver bronze, was designed by Mr. Leonard Stokes, the work being executed by Mr. Frampton. The late bishop's head, looking in profile towards the communion table, occupies the upper portion of the bronze, and in the space in front of the face is indicated the head of a crozier. Below is the inscription in raised lettering. The whole is surrounded by a square border of cherubs' heads in low undefined relief, the top line of which is broken by a shield bearing the arms of the see marshalled with those of the family. This is surmounted by a bishop's mitre. The features of the late bishop have been reproduced with much fidelity. The medallion has been subscribed for by many friends throughout the diocese of Oxford, who were anxious that there should be some permanent memorial of Bishop Mackarness in his cathedral city.

THE HOUSE OF COMMONS.

WHEN members of the House of Commons return to their legislative avocations, they will find, says a correspondent of the *Birmingham Post*, that during the recess certain intentions of the Clerk of the House (Mr. Palgrave) have been carried out. That gentleman desired to mark various positions of great historical interest within the Palace of Westminster; and, with the approval and aid of the Office of Works, this is now being done. In St. Stephen's Hall, for instance, a brass plate will for the future tell of how this—through which every visitor to the House must pass—occupies the exact site of St. Stephen's Chapel, built in the reigns of Edward I. to Edward III. and from 1292 to 1364, assigned to the use of the Commons in that of Edward VI., and in which their last sitting was held on September 25, 1834, the ancient building being destroyed by fire on the ensuing October 16. Marks are also placed in the floor to show where stood the Speaker's chair and the Clerk's table; and another tablet at a little distance indicates the line of demarcation from the old lobby, in which Perceval, when Premier, was shot by Bellingham, in the second decade of this

century, and through which Mr. Gladstone alone, among all who are now in the House of Commons, has passed as member. And, proceeding from St. Stephen's Hall to Westminster Hall, no one who has a trace of historic sentiment will pass unnoted the record that "This tablet marks the spot where Charles Stuart, King of England, stood before the High Court of Justice" on four fateful days in January, 1649, and that it was there he heard sentence of death pronounced upon him; or that other which shows where stood the bar which divided the Court by which Charles Stuart was condemned from the body of "the hall of Rufus." To Mr. Palgrave and all concerned, in fact, thanks are due for so excellent a fulfilling of a worthy task.

TESSERÆ.

Greek Sculpture.

THERE can be no doubt that the traditional excellence of the Greeks in sculpture is very inadequately represented in the large collections of works that have reached modern times. The museums of Europe possess, with very few exceptions, but repetitions and often indifferent Roman copies of the more celebrated productions of the great masters of Athens, Sicyon and Argos. It is true the motive and general spirit of the ancient feeling and intention, so remarkable in the simplicity and repose of the compositions, may be traced in the numerous statues and *rilievi* that abound, but however valuable they may be in the estimation of antiquaries and scholars, usually very incompetent judges of technical excellence in art, and however useful in illustrating the history, the customs, myths and poetry of their age, how limited is the number of those which, if judged by competent, practical opinions, can be classed as examples of perfect sculpture? It is, indeed, remarkable how very few of the monuments that have been preserved can be identified with works particularised by ancient authors. The names and titles which have been given to many well-known statues, as the *Fighting* and *Dying Gladiators*, the Townley Venus, the Theseus (Brit sh Museum), the so-called Jason and others, are but conjectural, and are open to question. In like manner the subjects of some of the most extensive compositions, the groups in the pediment of the Parthenon and of the temple of Jupiter Panhellenius (Ægina), for instance, are still matters for antiquarian inquiry and discussion. It must be remembered that we are indebted for nearly all the information we possess on these subjects to writers who lived long after the most flourishing period of Greek sculpture; their accounts must, therefore, be received with due allowance for their incompleteness and imperfections. Amongst those especially noted for their records of art are those diligent but somewhat indiscriminating collectors of the gossip of their time, Pliny and Pausanias. In the curious compilation of the former, extending to almost every class and variety of subject, the account of celebrated works of art and their authors seldom extends beyond a mere catalogue of names, without detailed description, and is never heightened by any useful criticism; a circumstance the more to be regretted because Pliny distinctly refers to the interesting fact of many ancient artists having written on their art, but from whose works he gives no extracts. In Pausanias there is more particular description of the works he saw in his travels, but even here there is no attempt at criticism. Happily some rare specimens are extant to prove that the tradition of the superlative merits of the great Athenian and other schools has a true foundation and is not a mere superstition. So long as the sculptures of the Parthenon, with its grand pedimental statues and groups, the vigorous compositions of the metopes and the frieze of the cella exhibiting the busy scene of the Panathenaic procession; so long as the Venus of Milo, that noble personification of the highest class of mature female beauty; so long as the bronzes of Siris, the medallions of Syracuse, and a few other undisputed and unrivalled monuments of these schools are preserved, there will be sufficient evidence of what the great masters of that glorious age of sculpture could and did achieve. But such works as these are exceptional in their supreme excellence, and it is no disparagement to the ancients and no undeserved compliment to the more eminent modern sculptors to assert that, where they have studiously imitated the classical types, their productions will bear favourable comparison, in technical qualities, with the average ancient statues that are now found crowded together in collections of such objects. It is in the motive and sentiment that the modern works are deficient necessarily, and it can only be for their material qualities that productions bearing the nomenclature of the classical poetry, but without its spirit, can deserve the commendation claimed for them.

Greek and Roman Pottery.

The Greeks and Romans employed two distinct materials in their pottery, one of which yielded a coarse, almost granular, not very homogeneous or uniformly coloured and very porous mass, and the other, which yielded a body beautifully homogeneous, a porcelain-like grain and very dense. The amphoræ, cinereal and lachrymal urns, in which the ashes were placed in the tombs, were made of the first-mentioned substance. The amphoræ were often of gigantic size, sometimes from 8 to 10 feet in height and 3 feet in diameter. The celebrated tub of Diogenes was an amphora of this kind. In Spain enormous jars called "tinajas" are made for holding wine, oil, flour, &c. Two localities are especially celebrated for these articles, Castello de los Jarrès and Colmenar de Oréja, not far from the celebrated royal residence of Aranjuez, where jars 13 feet high and 7½ feet in diameter are made. Similar vessels are also used in the south of France and in Italy, and indeed in all the Mediterranean countries, though perhaps not of such a remarkable size as the Spanish ones. The statues and finer vases and tazzas of antiquity were frequently coloured in the clay, some black, some brownish red, and others of a beautiful sealing-wax red, hence named terra-sigillata. In addition to this colour of the body the surface was usually coloured, the statues, architectural ornaments and tombs being often green or blue, and the vases or tazzas being sometimes ornamented with black silhouette-like figures on the red body, these being considered the most ancient, while those with the figures in red, buff and white on a black ground belong to the highest period of Greek art. Three different classes must be noticed, those with black figures on a red ground, those with brownish-red figures on a black ground, and yellowish-white or buff-coloured figures on a black ground. The body in all cases is red, in imitation of terra-sigillata, the black figures being made in a sort of clay pigment worked up with quick-drying oils and subjected to a considerable temperature, the black colour being thus produced by charcoal. Many of the old vases were also covered with an exceedingly thin glaze or glass consisting of silica, iron and soda which must have been very pretty. This glaze has been found to consist of a combination of silica and soda, or rather of clay with that substance, being in fact a true glass, but we are ignorant whether, like our modern salt-glazed ware, it was formed with salt. This species of glazing appears to have been known at a very early period, for many articles, especially bricks, glazed in this way have been found at Nineveh, some even of various colours, and Herodotus mentions the walls of the palaces of Ecbatana, in the empire of the Medes, were painted of seven colours, meaning in all probability walls built of these coloured and glazed bricks. The Greeks and Romans do not appear, as far as we are aware, to have used glazed pottery (although well acquainted with it) to the same extent as the Eastern nations. They did not consequently make any improvements, at least any which have reached us.

Water-Colour Drawing.

Turner in his practice showed how entirely he appreciated what may be termed the genius of the materials he used. Just as in oil he never failed to take advantage of its power of solidity, combined with transparency, so he never sullied the lovely quality of transparency in water-colour—its very essence and spirit—with opaque mixtures. It is as great an error in artistic practice merely to stain a canvas with thin washes of oil-colour as it is to pollute water-colour with opaque mixtures; and when the moment arrives that a water-colour draughtsman finds he cannot give expression to his artistic feeling without the use of solid colour, let him at once become an oil-painter or work in distemper. The use of splotches of permanent white (a great misnomer, by the way) amidst transparent water-colour is as incongruous and inharmonious in its results as is the ruling of skies by machinery, combined with hand-work, in modern engraving. It may be with truth asserted that in no one of Turner's completed drawings will a touch of opaque colour be found. He occasionally, though very rarely, used it in his sketches from nature, where he desired to get with the utmost rapidity the effect which at the moment impressed him; but these sketches were almost always made upon tinted paper, where the necessity for using opaque white may be said to be absolute. It is to be feared that the temptation to produce drawings with rapidity and comparative facility has been the chief cause of the general adoption of a practice which Turner pronounced to be so pernicious. A water-colour draughtsman who cherishes the pure and beautiful ground he works upon for his lights, or, if he has lost this, scrapes or washes them out, has a far harder and more anxious time of it than he who, by the aid of opaque mixtures, dabs them on in a moment and renews them at pleasure. It may, however, readily be conceded that another and worthier reason for the use of opaque colour is the yearning of the artist to have substance and solidity in his material; but when he feels this, and that he is flagging in devotion to those qualities of art which water-colour, and water-colour alone, can produce, he should become an oil-painter, and cease to be a water-colour draughtsman. The art of pure water-colour is entirely free from that element of evil which is an enduring source of vexation to every true painter in oil, and to get rid of which his choicest devices are put in practice, namely, the sense and look of the material paint, and some of the loveliest effects in nature are far more touchingly

and truly rendered in water-colour than in oil. It is a trite remark to say that there is no rule without an exception; and it would not be right to quit this subject without calling attention to the practice of William Hunt—one of the greatest amongst the great men already referred to. During the latter years of his life, and especially in his marvellous studies of fruit and flowers, there is no doubt that he used opaque colour freely, but in a manner and with a skill entirely his own. In his drawings there are no dabs and splotches; but the opaque stuff is so hidden up and blended that without minute examination we scarcely detect its presence. But, beautiful as these works are, a comparison between his former and latter styles would show the great and undoubted superiority of his earlier work in pure and refined artistic qualities. The very exceptional nature of Hunt's practice in this respect is clearly shown by comparing it with that of one as great as he, David Cox. It may be truly said that every touch of opaque colour in the drawings of this admirable artist now exhibited gives a pang of grief to the spectator, marring and blurring, as it does, his otherwise beautiful workmanship.

Veleia.

The ruins of Veleia are situated only twenty-one miles distant from Piacenza, but the place is not much noticed by travellers. There are grounds for supposing that Veleia was destroyed in the fourth century of the Christian era, but in what way is unknown. A tradition of the country, however, exists that a torrent of water descended from the mountains Moria and Rovinazzo which overwhelmed the ancient city of Veleia. The probability is that this tradition is correct, for the town is found to be buried under enormous masses of stone and earth, quite analogous to the composition of these neighbouring mountains, and the name of Rovinazzo may be conjectured to have been given to one of them after this mischance. The discovery of the ruins took place in 1746, when a peasant pursuing his agricultural labours in a field found what is called the "Tavola alimentaria" of Trajan, a most curious historical monument which proves that the Emperor supported 279 poor children of both sexes. This table, though of metal, was broken in various pieces and dispersed, part of it being sold in different places. It was in contemplation to make a church bell of one of the pieces when a canon of Piacenza redeemed it from the steeple. Thirteen years afterwards, in 1760, digging was commenced for the sake of making discoveries on the spot where the table had been found. The forum was soon laid bare, with various monuments placed above and around it. Statues and inscriptions rewarded the labours of the search, and the Prince of Parma took sufficient interest in the operations to order a house of wood to be constructed for himself and his court that they might witness the progress of the excavations. In 1765 the digging ceased and had scarcely been again renewed until 1816, when the Archduchess Maria Louisa paid a visit to Veleia and ordered further researches to be made.

Allston, the Painter.

Washington Allston was a native of South Carolina, and born in 1779. He says of himself, in some notes sent to Mr. Dunlop, that the turn for imitation and composition had shown itself as early as six years old. His delight was to put together miniature landscapes of his own invention, built up with moss, sticks, pebbles and twigs representing trees, and in manufacturing little men and women out of fern stalks. These childish fancies, he says, "were the straws by which an observer might then have guessed which way the current was setting for after life. And yet, after all, this love of imitation may be common to childhood. General imitation certainly is, but whether adherence to particular kinds may not indicate a permanent propensity I leave it to those who have studied the subject more than I have to decide." When at Harvard College he attempted to paint in miniature, but "could make no hand of it." Before he left college his future career was determined. Left early master of himself, he sold his paternal estate for the purpose of studying in Europe. He had generous friends, who came forward with offers of aid, who would fain have prevented this sacrifice of his property. But Allston, with the high spirit which through life distinguished him, refused these offers, and threw himself, at once and finally, on his own resources. He arrived in England in 1803, was received by his countryman, West, then president of the Academy, with his usual urbanity and kindness, and by Fuseli, not always courteous, with distinguished courtesy. There seems to have been, from the first, an immediate and intelligent sympathy between these two poetically gifted spirits. Allston confesses that he then thought Fuseli "the greatest painter in the world"; and he retained a more qualified predilection for him ever after. His preference of Fuseli to West at that time, favoured as he was by the attention and kindness of the latter, marks the poet, for such Allston was. Fuseli asked him what branch of art he intended to pursue; he replied, "History." "Then, sir, you have come a great way to starve!" was the characteristic reply. The effect which Sir Joshua's pictures produced and left on his imagination also stamps the particular bent of his mind and character. He said, happily, "There is a fascination about them which makes it almost ungrateful to think of their defects." Allston remained two years in England and exhibited three pictures, one of them (a comic subject, too) he sold. This was beginning well. In 1804 he went to Paris, studied and meditated in the Gallery of the Louvre, then rich with the spoils of nations, copied Rubens in the Luxembourg, and proceeded to Italy, where he remained four years, residing chiefly at Rome, where Thorwaldsen was his fellow-student. His feeling for what the grand old masters have achieved was deep—was genuine. They grew upon his mind as they do on all minds large enough to take them in. In his appreciation of Michel Angelo he agreed with Sir Joshua. "I know not," he said, "how to speak of Michel Angelo in adequate terms of reverence!" Allston was not satisfied with reverencing the old masters and copying their pictures; he imitated their mode of study and devoted much time to the modelling of the figure in clay. That boldness and firmness of drawing and foreshortening which he displayed in his pictures, even his smallest compositions, may be traced to this practice. He said, late in life, "I would recommend modelling to all young painters as one of the best means of acquiring an accurate knowledge of form. I have occasionally practised it ever since." At Rome Allston acquired, among the native German painters, the name of the American Titian, and there he formed a lasting friendship with Coleridge and Washington Irving. He said of Coleridge, "When I recall some of our walks under the pines of the Villa Borghese I am almost tempted to dream that I had once listened to Plato in the groves of the Academy. It was there he taught me this golden rule, 'never to judge of a work of art by its defects,' a rule as wise as benevolent, and one which, while it has spared me much pain, has widened my sphere of pleasure." Notwithstanding his sensitive taste, Allston remained to the end of his life "a wide-liker," to borrow his own expression.

The Temples of Agrigentum.

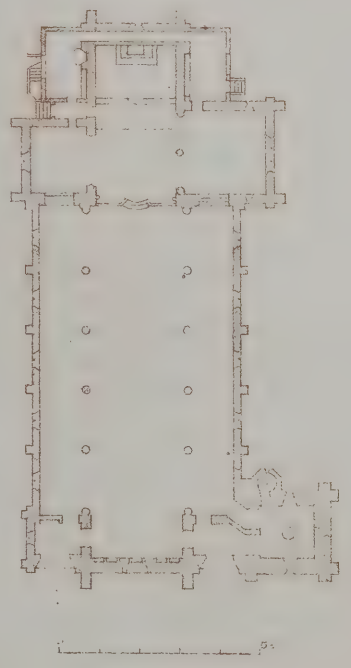
Imagination can scarcely conceive a more glorious prospect than that which the southern cliff of this great city once displayed, surmounted by a long unbroken line of the finest monuments of Grecian art. Amongst them stood six majestic temples, of that severe Doric order which so happily combines elegance and simplicity with solidity and grandeur. The south-east angle is still seen crowned with the ruinated colonnade of Juno Lacinia surrounded by broken masses of its entablature: next to it is a very fine temple nearly entire, except the roof, commonly supposed to have been dedicated to Concord, being indebted for this extraordinary state of preservation to the piety of those ages which converted it into a Christian church. That of Hercules, the next in order, seems to have been demolished by the violence of an earthquake, as it lies in all the confusion which such an overthrow would be expected to occasion. This was one of the finest temples of Agrigentum, and held by the citizens in peculiar veneration; in size and plan it resembled the Parthenon of Athens, and contained several *chef-d'œuvres* of painting and statuary. Its inimitable picture of Hercules strangling the serpents was presented to the Agrigentines by Zeuxis; the adytum was adorned with a miracle of art, a statue of the presiding deity by Myro, who inscribed his own name upon the thigh in small studs of silver. Cicero, in his lively description of a nocturnal attempt made by the emissaries of Verres to carry off this statue, takes notice of a circumstance which shows how similar are the effects of superstition in all ages; he observes that its mouth and chin, though made of bronze, were actually worn by the kisses of its admiring votaries.

Imitation in Egypt.

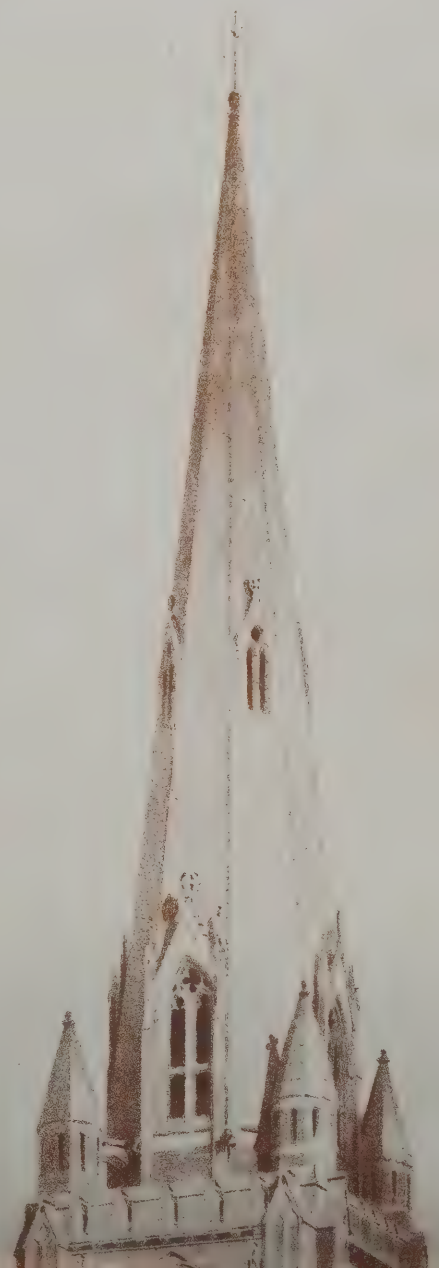
Many false stones, in the form of beads, have been met with in different parts of Egypt, particularly at Thebes; and so far did the Egyptians carry this spirit of imitation, that even small figures, scarabæi and objects made of ordinary porcelain were counterfeited, being composed of still cheaper materials. A figure which was entirely of earthenware, with a glazed exterior, underwent a somewhat more complicated process than when cut out of stone and simply covered with a vitrified coating. This last could therefore be sold at a low price; it offered all the brilliancy of the former, and its weight alone betrayed its inferiority; by which means, whatever was novel or pleasing from its external appearance was placed within reach of all classes, or at least the possessor had the satisfaction of appearing to partake in each fashionable novelty. Such inventions, and successful endeavours to imitate costly ornaments by humbler materials, not only show the progress of art among the Egyptians, but strongly argue the great advancement they had made in the customs of civilised life, since it is certain that until society has arrived at a high degree of luxury and refinement artificial wants of this nature are not created, and the lower classes do not yet feel the desire of imitating their wealthy superiors in the adoption of objects dependent on taste or accidental caprice.

NOTES AND COMMENTS.

IN proposing a toast at the jubilee dinner of the Royal Scottish Society of Arts in Edinburgh, Mr. BRUCE PEEBLES, C.E., was able to refer to many distinguished scientists and other notabilities who had been members of the Society. Among them were Sir DAVID BREWSTER, Dr. ABERCROMBY, Professor ALISON, Sir WM. MAXWELL, Sir HENRY ERSKINE, Sir THOMAS DICK LAUDER, Professor CHARLES HOPE, Lord JEFFREY and Professor FLEEMING JENKIN. Mr. PEEBLES also said that the invention of the screw-propeller and other inventions of world-wide reputation had been due to members. The President of the Society pointed out some of the improvements which had taken place since the Society was founded in 1841. As regards railways, the first volume of the Transactions contained a paper by the late Mr. DAVID STEVENSON upon one of the railways of England, in which were recounted some things that at that time were thought very extraordinary. The remarkable fact that the locomotive department of that railway spent the enormous sum of 28,000*l.* in one year was mentioned, and that the engines were driven by a driver with the aid of a fireman. "As a check on their regularity," the paper went on, "a fine of 2*s.* 6*d.* is imposed on the engineer for every fifteen minutes he arrives before his time." For the following papers, read during the past session, medals and other distinctions have been awarded:—"On an Electrical Bench for Physiological Research," Dr. R. MILNE MURRAY; "On an Improved Mining Theodolite," JOHN WHITELAW, C.E.; "On a Hospital Table and Ambulance Appliances," W. B. BLAIKIE; "On some Mechanical Appliances for Demonstrating Geographical Problems," W. B. BLAIKIE; "On the Phonograph," C. R. JOHNSTON; "On the Telegraph Exhibits at the International Exhibition," F. GRANT OGILVY; "On the Telpher and Electric Railways at the Exhibition and on Electrical Traction," E. MANVILLE and J. G. STATTER; "On Electrical Navigation," A. R. BENNETT; "On Glazed Cast-iron Pipes for Water and Soil," T. SAUNDERS; "Notes on a Method of Testing Boiler Economy, and the results of such a Trial," Professor T. H. BEARE; "On the Kettering Sewage Purification Works," WILLIAM FAIRLEY; "On a Pedal Vice," L. ROTTENBURG; "On Electrical Traction," M. HOLROYD SMITH; "On the International System of Water and Sewage Purification," HENRY M. CADELL; "On a Description and Comparison of the Systems of Electric Lighting at present in use in London," Professor A. B. W. KENNEDY.



IT might easily be imagined that not many new cases relating to light and air could turn up, but one that in most respects was novel came before Mr. Justice CHITTY on Wednesday. It appeared that in 1873 a man who was the testator from whose act the proceedings issued erected a house in a field. He died two years afterwards. In his will he bequeathed the house to one legatee, and the field in which it was situated to another. Fields are not worth much for agriculture, and the new owner proposed to convert his into building land. The question then arose about the respective rights of the parties. Did the possessor of the house acquire rights for ever over the field as regards light and air, or was the owner of the field legally entitled to build houses that would obscure the light from the windows? Mr. Justice CHITTY set aside the peculiarities of the case. He treated the house as if it had been disposed of for a valuable consideration; that is, he regarded it not merely as a structure, but as being endowed, as it were, with important and extraneous qualities which it was the duty of the Courts to protect. His lordship said that if the owner of a house and field by deed for value grants the house, but retains the field, it is settled law that a right to the light required for the enjoyment of the house passes to the grantee, because "the lights are a necessary and essential part of the house." In other words, what is conveyed is not a mere brick or stone building with apertures called windows, but a house with windows enjoying light. This is the broad, substantial reason which commends itself at once to the common sense of mankind. Worked out somewhat more technically, the conveyance operates as an implied grant of the light. Blocking up the windows by the grantor is regarded as an attempt on his part to derogate from his grant—a form of expression which assumes that the right to light has passed to the grantee. The implication does not necessarily arise upon a mere perusal of the deed itself; generally the situation and ownership of the adjoining field is not disclosed, but the implication of grant arises *primâ facie* so soon as the facts are ascertained that the light required for the windows passed over the field, and that the grantor was owner of the field at the time of the grant. On these facts being known, and in the absence of any other special circumstances, the law imputes to the parties an intention that the easement of light should pass with the house by virtue of the grant. The house devised to the plaintiffs contained windows so constructed as to involve a necessary dependence, in order to its enjoyment of light, upon the adjoining tenement. Light is an apparent continuous easement, and of course must be treated with as much respect as if it were something in a more material form. By arguing in that way his lordship could not come to any other conclusion than that the owner of the field had no right to obstruct the access of light to the house, and therefore judgment was given for the plaintiffs.



THE exhibition of MEISSONIER'S works will be held in the Ecole des Beaux-Arts, Paris, next year, from May 1 to May 31. In addition to the ordinary catalogue, it is intended to produce one that will be illustrated and costly. In order to facilitate the arrangements, the owners of paintings by the artist who are willing to lend their treasure are solicited to inform the committee as soon as convenient. The treasurer and principal agent in the affair is M. EDOUARD DETAILLE, who was one of M. MEISSONIER'S few pupils. The last exhibition of M. MEISSONIER'S works in Paris was got up by the artist himself, in order to aid a night asylum. The money derived from the forthcoming exhibition will be applied towards the erection of the memorial of the artist, which is to be erected in the garden that is on the site of the Tuileries.

AN ample supply of water is available for Dublin, but it is becoming more difficult every day to deliver the full quantity throughout the city and those parts of the suburban districts that are dependent on the Vartry reservoirs. This is owing to the diminution of the pipes by an incrustation of oxide of iron, which takes away on an average an inch from the capacity or discharging power of a pipe. In some streets the pipes are nearly filled by the deposit. The defect will continue to increase. As it is impracticable to clean the pipes, the Corporation of Dublin are about to apply for a Provisional Order or Act of Parliament which will authorise the laying-down of a second line of conduits. This operation will cost about 150,000*l.*, but when completed the water can be turned into the new pipes, and the others will then be scraped and cleansed. The contemplated outlay is a large sum to have to pay on account of defects, especially as the existing pipes are comparatively new, but the incrustation is due to the quality of the water.

IT is not improbable that the coming year will bring an alteration which will be almost a revolution in the administration of the French museums and galleries. At present most of these are open to all visitors for the greater part of every week without payment. It is now proposed to adopt the opposite plan, and insist on payment for admission, at least upon four days in a week. The principal cause for the change is the necessity for obtaining money to meet the expenses. Votes for museums are grudgingly passed, and as a rule the amounts are much reduced. Barely enough is granted to pay the salaries of the officials, which are all fixed at a low rate, and other indispensable expenses, and the curators cannot take advantage of the chances which are offered from time to time for obtaining objects for the collections. It is considered that the admission fees will amount to a large sum in a year. At present a scheme is being considered by the French Government for saving a part of the money, and with it and other sums which may come in founding a credit which can be utilised for acquisitions. It is likely to be approved, for the administration would occupy the spare hours of many legislators.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE ordinary meeting of the Institute of Architects for the present session was held on Monday evening, Mr. J. Macvicar Anderson, president, in the chair.

The PRESIDENT delivered his inaugural address, from which the following is taken :—

President's Address.

Of the many subjects of interest to which I might direct your attention, there is, perhaps, none which more directly affects the profession, through the medium of this Institute, than that of examination. I deem it, therefore, superfluous to offer any apology for proposing to occupy some portion of your time in a review—retrospective and prospective—of this subject; and should I appear in so doing partially to tread once more a well-beaten track, I venture to hope that the importance of the subject will justify me in craving your indulgence and attention. I am led to enter on this inquiry because the attention of this Institute will shortly have to be directed to the propriety or otherwise of establishing an examination for admission to the class of Fellows, and if I refer particularly to this now, it is not certainly with the intention of forestalling the deliberate judgment of the Council, by whom it has yet to be considered, and whom I have in no way consulted, collectively or individually, but because I think it desirable that the subject should be brought under your notice, with the view of being maturely thought over, prior to any decision being arrived at.

I may say at the outset that I am of course aware that there are some within the Institute as well as outside of it who are opposed to the policy of examination, and who, considering it prejudicial to the welfare and highest interests of the profession, would deprecate its extension. To such, especially those who are members, I may reasonably urge that the day has gone by for raising objection or inaugurating opposition. No one can allege that the policy was not maturely considered prior to its adoption in 1882, and its subsequent confirmation by Royal Charter in 1887, and I apprehend that any who now find themselves honestly opposed to it should feel loyally bound by the decision of the majority ; and if on principle they are unable to take an active part in the scheme of examination, they should at least avoid any action which may tend to injure or to minimise the influence of the Institute in the honest endeavour to raise the standard of knowledge and efficiency, and so to promote the highest interests and the credit of the profession.

But what is the argument on which this opposition to examination is based? You will find it embodied in a memorial which was presented to the Council, and in a letter which the memorialists published in the *Times* last March, under the title of "Architecture : an Art or a Profession?"—words which appear to me to suggest under an attractive form an entirely false issue, and one which in its essence is misleading. To declare that architecture is an art is to repeat a truism ; it is not only an art, but a fine art, to which in some respects the sister fine arts of painting and sculpture are handmaidens in a sense which cannot be said of architecture in relation to either of them. I yield to none in my appreciation of the nobility of our calling as the embodiment of the highest form of art. Painting and sculpture are luxuries that can be indulged in only by the rich, but architecture is a necessity felt by all, the poor no less than the wealthy. A civilised community must have houses to live in, schools and colleges to learn in, offices to work in, hospitals to be sick and to be visited in, houses of parliament to legislate in, palaces of justice to enforce law in, museums and galleries to exhibit objects of art and science in, and, though last not least, cathedrals and churches to worship God in ; and what nobler or more elevating occupation can be conceived than to design with fitness and clothe with beauty those permanent necessities of everyday life, so that each in its turn may contribute to the convenience and the pleasure of mankind? But architecture is more than all this. It is an art *and* a profession. To ask whether it is an art or a profession is not only, in my judgment, to put the subject in an incomplete and a misleading form, but to endeavour to divorce two things which are indissoluble. Why, the unique characteristic of our calling is that it combines such different qualifications—artistic taste, scientific knowledge, business proficiency. We have no claim to be architects in the true and full sense of the word unless we are artists, able so to dispose and to clothe the materials with which we have to deal as to produce beauty of form and proportion. But we must also be scientists, so familiar with the strength and properties of materials as to combine them in sound construction ; and we must, moreover, be men of business, so conversant with affairs as to be able to protect the pecuniary trusts which are committed to us. Of what good to society would be the most graceful design in architecture if it were so devoid of constructive merit as to collapse? Or, conversely, what claim has the most perfect construction to architectural merit unless clothed with beauty? The body politic of architecture is composed of parts, each one of which is essential to the unity of the whole, and without any one of which it would be incomplete and useless to society. There are those amongst us whose proclivities and aspirations are specially artistic ; there are those whose genius is constructive ; there are those who *par excellence* are men of business. The ideal architect is the man in whom these qualities are united, who is an artist, a constructor, and a man of business. It is given to few to excel in all, though there are many who, possessing a general knowledge of each, are proficients in one or the other. And is one who is distinguished by artistic taste to regard with indifference or a species of contempt others who may be less artists and more scientists? Or is one whose genius is construction to look askance at others who are more purely artists? As well might the foot say to the hand, or the eye to the ear, "I have no need of thee," as if the one or the other were the body. No, architecture is not merely an art, it is not merely a science, it is not merely a profession ; it is the combination in one of the artist, the constructor, and the man of business, and any who claim that it is one only, to the detriment of the others, detract from the nobility as well as from the unique character of their calling. They vainly strive to disintegrate things which are inseparable, and which must go hand in hand. As well seek to sever cause from effect ; as well assert that root and stem have no part in producing the rich foliage or the delicate flowers on which the eyes of man feast with delight.

While thus advocating a spirit of catholicity and tolerance it is evident that the association of those whose feelings and aspirations are in unison is not only natural, but within proper limits productive of benefit, and is only to be regretted when through the undue preponderance of party feeling it ends in schism. There should be no room for schism here, yet I know of at least one member who retired from the Institute because he thought it did not sufficiently represent the artistic element in architecture, and I know of others who, for this or cognate reasons, decline to become members. I have every sympathy with the feeling that the Institute should be an artistic guild, but I demur to the action of those to whom I refer, for I maintain that the Institute does represent the artistic side of the profession, and to leave it, or to refuse to join it, on such grounds as I have indicated, is but a poor compliment to those of our number who are admittedly among the first artists of the day. Moreover, such action seems to me to spring from a narrow and schismatic view, and to be tinged with extraordinary inconsistency, for if it were the case, which I do not admit, that the Institute is insufficiently representative of art, surely the proper course for those whose sympathies are specially artistic is to strengthen the artistic element by their presence, and not to weaken it by their absence. With regard to all such I feel sure that I express the pervading feeling when I say that we deplore their absence, and would willingly extend to them a friendly and cordial greeting as fellow-workers in our noble art, for the Institute does not claim to be the home of any school or party, but to represent, in its widest and most elastic sense, the profession of architecture.

But to pass from the general to the particular, let me refer to the argument embodied in the memorial to which I have referred. It is said that "while it is possible to examine students in construction and matters of sanitation, their artistic qualifications, which really make the architect, cannot be brought to the test of examination ;" consequently that the attempt to test the knowledge of art by examination is delusive and calculated to militate against the interests of architecture as a fine art.

Is this so? Art has a history, which there is no difficulty in teaching, delineating its varied forms and combinations in different ages, and tracing such combinations to their sources, the usages, peculiarities and requirements of succeeding generations ; and is it not of the highest benefit to the artist, in developing his mental faculties and aspirations, to become thus familiar with the history of his art? But what of the theory and practice of art? Are not these systematically taught in architects' offices, in the classes and schools of the Royal Academy in this country, the Ecole des Beaux-Arts and other schools in France, in many kindred institutions on the Continent, and in the schools of art and of design throughout this

country which have tended so greatly of late years to improve the designs of our textile fabrics?

If then the history, the theory and the practice of art are thus imparted by teaching, with what truth can it be asserted that to test such acquired knowledge by examination is detrimental to its highest interests? No one is so foolish as to contend that any one ever has been, or ever will be, made an artist by examination; but no more will any one pretend that an artist ever has been, or ever will be, created by teaching; for the spirituality of art, so to speak, is inborn, and cannot be imparted. But much that is valuable, if not essential, to the career of an artist can be, and is, taught, and to test knowledge thus attained cannot possibly do any harm; while, on the other hand, it may be, and I believe is, productive of nothing but good to the student. It is one thing to acquire knowledge in a general way by study; it is another thing to test the application of such knowledge, and to root it in the memory, by examination. And is not this test the experience of all from the cradle to the grave? In childhood, as at school and college, is not the acquisition of all knowledge tested by examination? Does not the entrance to most professions and callings consist of some such test? Is not the experience of life a continuing examination? Society consists of two classes—employers and employed; if the latter are found deficient in the knowledge they profess, they will soon cease to be employed. Do not artists themselves habitually subject themselves to examination by submitting their works at the Royal Academy and elsewhere to the test of public approval? Do not our own so-called art members voluntarily accept the same principle when they engage in competitions, and submit their knowledge of the art they profess to the test of examination by promoters and assessors? There is not a man living, be he artist or not, who, in some form or other, does not undergo the test of examination at the bar of public opinion? Can it then be that the single exception to this universal experience should be found in the year of grace 1891 at No. 9 Conduit Street? and can our modest, though honest, endeavour to raise the status of our members and the credit of the profession be truly described as detrimental to the highest interests of the art which we profess and love?

You are all aware that the Charter enacted in 1887 not merely that "every person desiring to be admitted an Associate shall be required to pass or to have passed such examination or examinations as may be directed by the Royal Institute," but also that "after the expiration of five years from the date of this our Charter, the Royal Institute shall have power to declare that every person desiring to be admitted a Fellow shall be required to have passed such examination or examinations as may be directed by the Royal Institute." Thus, while the qualifying examination for Associates was made compulsory, the institution of a similar examination for Fellows is permissive only. It is significant that a date should have been specified on and after which a declaration might be made relating to an examination for Fellows, showing that the possibility, if no more, of instituting such an examination was at that time contemplated by the Institute. The specified period on and after which it is permissible to make a declaration on the subject will expire next March, and it seems to me, therefore, by no means premature to invite your attention to the matter now. There are, of course, several methods of dealing with the subject; for example, the powers granted by the Charter being permissive, the Institute may elect to take no action, or to declare that it is expedient to defer taking action, or to declare that on and after a specified date no one, except under certain conditions, shall be admitted a Fellow who has not passed such examination as the Institute may have established. In order to assist us in forming a correct judgment, it is pertinent to inquire what has been the result of the compulsory examination for Associates established in 1882. For the purpose of comparison, it will be only fair to exclude the two years immediately preceding that date, during which an exceptional influx of Associates occurred, from reasons into which we need not inquire too curiously. I propose, therefore, to take the eight years from 1872 to 1880, and to compare them with the eight corresponding years in the succeeding decade, viz. 1882 to 1890. During the former period the number of Associates who were elected was 246, or an average of thirty-one per annum, while in the latter period the number of Associates who were elected was 328, or an average of forty-one per annum. It is to be observed that this latter average would have been still larger had the whole of the 533 candidates who applied to be examined been passed, or had the whole 366 who were passed been elected. It is, moreover, worthy of note that since the year 1887, when the compulsory examination for Associates was confirmed by royal charter, a remarkable increase in the number of applicants has occurred, for in the four succeeding sessions there were no fewer than 375 candidates, of whom 262 were elected, being an average of sixty-five per annum. It thus appears that while prior to the institution of the compulsory examination for Associates in 1882 the average of annual elections was only thirty-one, since that date the annual average has been forty-one; and further, that since the confirmation of the examination by royal charter the annual average has been sixty-five. These are facts which cannot be controverted, the significance of which is remarkable. Bearing in mind that the abnormal number of Associates who were admitted in the two years immediately preceding the establishment of the compulsory examination must have reacted prejudicially against the number of candidates for some years thereafter, the figures I have quoted can only be regarded with extreme gratification, for they afford irrefragable evidence that the compulsory examination has not exercised a deterrent effect so far as Associates are concerned, but, on the contrary, has actually formed an incentive and an inducement to join the Institute. This result may surprise some, but it is really no more than might have been anticipated, for it is obvious that membership acquired by means of the test of examination becomes a much more valuable and valued possession than if it had been acquired only by means of a money payment.

The result therefore of nine years' experience of the compulsory examination for Associates is that the public have the guarantee that there are at least 376 of the rising generation of architects who have proved by this test that they possess such technical knowledge of architecture as has justified the Institute in enrolling them as Associates in pursuance of its chartered rights. This is satisfactory, but it is still more so to reflect that in course of time, when the present generation shall have passed away, there will be a similar guarantee in respect to every Associate of the Institute. Were our numbers to remain as they now are, that would apply to 800 Associates, but the figures I have quoted prove that the class of Associates is increasing by rapid strides, and I entertain no shadow of a doubt that by the time I refer to the number, if not doubled, will be vastly more than it now is.

But this is not all. It is well known that unless with a definite object in view study is apt to be desultory, and is often neglected. In order to pass this examination a systematic course of study has necessarily to be engaged in, a vast amount of useful knowledge is acquired, and who will say that these 376 Associates of the Institute are not better men and will not be better architects from the enforced study and the acquired knowledge that they owe to the compulsory examination? Now, I ask, seeing that examination has resulted in the addition of so large a number of qualified Associates to the list of our members, why should not a similar result attend the extension of the same policy to the class of Fellows? The question is not so much why should Fellows be subjected before election to such a qualifying test as why should they be excluded from advantages which the other class of members has derived from it? Surely there is nothing in the relative constitution of the two classes which can render it undesirable that a treatment eminently successful and beneficial in the case of the one should not be applied to the case of the other. The Institute deliberately adopted in 1882 the policy of examination as the qualification for membership as Associates, and we shall be no more than consistent if in 1892 we take advantage of the permissive powers of the Charter and extend the same policy for membership as Fellows. Not to do so indeed would seem to imply one of two things: either unaccountable inconsistency or the conviction that the policy has failed as regards Associates—an assumption which would be untenable and absurd in view of the facts and figures which I have placed before you.

As the result of a careful review of the whole subject, I feel no hesitation in expressing the decided opinion that, in pursuance of the permissive powers of the Charter, the Institute should next year declare that on and after a date to be specified, "every person desiring to be admitted a Fellow shall be required to have passed such examination or examinations as may be directed by the Royal Institute."

In the event, however, of this policy being adopted, it should be understood that the words of the Charter, "But in special cases the Council shall have power to dispense with such examination or examinations," should be liberally interpreted for a period of years, for the obvious reason that there are men now in the profession enjoying extensive practice, to whom, should they propose to join the Institute, it would be manifestly absurd to apply the test of examination.

That there are difficulties which will have to be anxiously and carefully considered, I fully realise; but to say that there are difficulties to face is to tell us only what is common to all human enterprise: if regarded with timidity, they become rapidly exaggerated—if manfully wrestled with, they dissolve like the hillside mist before the rising sun. To go no further there rises on the threshold the question of examiners. Perhaps all are not aware of the arduous nature of the labours of the Board of Examiners, labours which are entirely gratuitous, which incur a grave sacrifice of time—in other words, money—and involve a great deal of consideration and study. For these labours, freely contributed during the last nine years by the chairman and members of the Board of Examiners in carrying out and developing the examinations for Associates, the Institute owes a deep debt of gratitude which no mere words can adequately express. For some time it has been to me

apparent that it is too much to expect a continuance of such gratuitous labours, and if, in addition to the existing examinations another should be instituted, the question of some form of recognition would have to be considered. This, however, is not a difficulty which can or ought to be regarded as insuperable; for, although our funds may at present be somewhat straitened from causes to which I may refer by-and-by, it is clear that means must be provided for the efficient support of an organisation which I look on as vital to the best interests of the Institute.

Before leaving the subject of examination, let me briefly refer to what some seem to look on as its necessary goal—registration. The inevitable evils which must accompany the adoption of any scheme of legal registration are admitted, even by its most ardent advocates. The preliminary question, therefore, which rises on the threshold of any consideration of the subject is, whether these evils are likely to be outweighed by counterbalancing advantages? It is no doubt regrettable that any one, whether qualified or not, should be at liberty to engrave "architect" on his door-plate; but it would be vastly worse, and only justifiable under the pressure of the gravest necessity, to legally register as a qualified architect every carpenter, auctioneer or undertaker who now has the effrontery to call himself so. And after all is the existing evil so great as it is made out to be? It may be thought a little humiliating to find tradesmen assuming to be qualified practitioners in a learned profession, but the pretension is so absurd as to secure its own defeat. There are a sufficient number of educated and qualified architects; if the public have not such intelligence and regard to their own interests as to discriminate now between them and the persons I have referred to, no Act of Parliament will endow them with it, any more than it will prevent quacks from finding means to impose on them. The Architects' Registration Bills which in recent years have been promoted in the House of Commons have failed in providing machinery that would remedy this evil. The mere enactment that no one could under penalties use the word "architect" unless legally registered would not meet the difficulty. There are numerous and obvious loopholes for the evasion of such legislation. I object to the proposed Registration Bill (1) because it is not called for; an essential preliminary to such legislation being that it is demanded by the profession, instead of being promoted by a few individuals who can in no sense be said to represent it; and (2) because it would inevitably fail in effecting the object set forth in the preamble. So far, therefore, as I am concerned, without doubting the *bona fides* of the promoters, I shall continue to oppose by any influence I possess such crude and uncalled-for attempts at legislation, which have only tended to confirm my original conviction that the remedy would be worse than the disease. I indulge in the prospect, the fulfilment of which I may not live to see, when every member of the Institute, whether Fellow or Associate, will be a qualified architect in the sense of having passed an examination instituted by his brethren as the necessary qualification for membership; for this, with the continual increase of our members which every succeeding year will see, is in my judgment the true solution of registration and would sufficiently meet any difficulty, such as the public is now said to experience, in discriminating between qualified and unqualified practitioners. The affixes F.R.I.B.A. and A.R.I.B.A. would in such circumstances and in the eyes of the public mean much more than they now do, for they could then only be used by those who had passed the test of a qualifying examination. Reference to these letters tempts me to remark incidentally that it is a pity some of our members appear to attach comparatively but little value to them. The initials F.S.A. must, I suppose, be assumed to have some magic influence with the public which our own F.R.I.B.A. do not possess, for they are always placed first. Why should this be? Can it be said that to be a Fellow of the Society of Antiquaries is a better qualification for an architect than to be a Fellow of the Royal Institute of British Architects? This anomaly, however, time will remedy.

In a foregoing paragraph I have incidentally referred to the state of our finances being less satisfactory than could be wished. We have perhaps enough to pay our way, but not much more, and that is not a budget which satisfies my notions of sound finance. I should like to see a much larger margin than has ever existed between income and expenditure, and to provide such a margin is the goal to which we should seriously strive to attain; for although there is perhaps no particular object in amassing a large capital, it would certainly be desirable to add to our present vested funds and thereby provide for future extension of premises, or for the acquisition of others more suited to our continual expansion; and it would be no less desirable to be able to set apart a yearly sum for the remuneration of examiners, and to contribute towards the encouragement of professional education in such forms as may from time to time appear best. I am far from thinking that there are not good reasons for the steady increase of our expenditure. The position which the Institute has of late years assumed in taking a more aggressive attitude in respect to public questions of architectural interest, the organisation of the standing committees, the machinery of the scheme of examination, the opposition to some and the support of other Bills in Parliament, the extension of our relation to allied and colonial societies, are all causes, and legitimate causes, of increased expenditure which has to be met out of income. Each of these causes contributes to the necessity of an increased staff, in order to carry on efficiently the work of the Institute. But, while granting all this, I maintain that we are not justified in living up to our income, but that we should, on the contrary, live well within it. How is this to be accomplished? Obviously by adopting one of two possible alternatives. Either we must reduce expenditure, or we must increase income. In respect to the former, I do not say it is impossible; but, after careful consideration, and guided by many years' experience of the working of the Institute, I do say that I can discover no considerable item of expenditure that can be saved without detriment to our welfare and influence. There remains the other alternative—the expansion of income—in which, in my judgment, is to be found the true solution. But is this practicable? By way of reply, let me put another question, which I desire to address directly to each one of our members. What has each one of us done, individually, personally, to increase our membership? How many of us have been the means of inducing ten others to join the Institute? How many five? How many one? You are all familiar with the parable of the man who called his friends and neighbours to rejoice with him because he had found what he valued. In the exercise of the same spirit, surely it becomes us, if we value membership at all, to use our personal influence with professional friends and neighbours, by pointing out the advantages of belonging to a strong representative society, the essence of whose constitution is the promotion of the best interests of architecture. Now, it must be assumed that the Fellows and Associates of this Institute do value membership, or they would not be where they are? Why, then, should we continue selfishly to enjoy privileges, when, by exercising a more liberal spirit, others by a very slight effort on our part might be led to participate in them? Let each one of us evince somewhat less apathy in this matter. There are now 1,366 professional members. Should I be so happy as to influence, say one-fifth only in the direction I desire, think what the result would be—such a substantial addition to our income as would provide at once the margin I so strongly desire to see created. Let me press these suggestions on your notice, with the view of giving to them practical effect. But let no one misunderstand me. I am not pleading, *ad misericordiam*, as if our position were a weak one. It is not so—far from it; rather is it a position of growing influence. I desire, by awaking members to a sense of their responsibility, to see it strengthened financially, in order that we may enlarge the sphere of our operations and of our usefulness. There is probably no more legitimate or more hopeful method of attaining this end than by means of the societies in Scotland, Ireland and the provinces, which the Institute, by virtue of the powers of the Charter, has admitted to alliance. We do not claim merely to represent metropolitan but British architects; hence we now have twelve allied societies, and at our first business meeting it will be my privilege to propose that the Dundee Institute of Architecture, Science and Art be admitted to alliance, thus increasing the number to thirteen. By means of such alliances we are kept in touch with representatives of local opinion and practice at the principal centres of life in the kingdom. The interest of all is identical, and cannot fail to be promoted by united action. I desire to see the Institute strengthened by the admission to its ranks of many members of our allied societies, by whom, I do not hesitate to declare, the advantages of membership will year by year be increasingly appreciated, in proportion as year by year they become more fully realised by the public. Moreover, when the Institute is called on to advise a Department of State, it cannot but add emphasis to our counsel when, as in a recent instance, such counsel is confirmed by the cordial support of our allied societies.

In connection with the subject of membership, I may briefly refer to a privilege which appears to have been inadequately appreciated on some recent occasions. Whether the principle of the ballot, as applied to such elections as ours, is expedient or otherwise, may be matter of opinion; it is significant that both the Institution of Civil Engineers and the Surveyors' Institution have abandoned it; there are those who look on it as an unmanly subterfuge for avoiding an honest expression of opinion; while, again, others consider it a convenient method of recording their vote without incurring personalities which might otherwise follow. The question of the ballot has, as you are aware, been raised in this room, and has been referred by the Institute to the Council, who have appointed a carefully selected committee—composed not exclusively of their own number—to consider the whole subject and report thereon.

To those whose professional practice lies within the metropolitan area, much inconvenience has of late years been experienced by the complications resulting from the numerous

statutory additions which have been made at different times to the Metropolitan Building Act of 1855. It is satisfactory, therefore, to know that the Local Government Board propose to introduce, during the ensuing session of Parliament, a London Building Law (Consolidation) Bill, the object of which is stated to be "to consolidate the Metropolitan Building Acts" and "certain sections of the London Council (General Powers) Act 1890." This will prove an undoubted convenience and advantage, so far as it goes. But it will only deal with one-half, and that the least serious half, of the question. The Metropolitan Building Acts are admitted by all who have occasion to refer to them to require not only consolidation, but amendment. Some clauses, if not obsolete, have been so successfully evaded as to have become practically so; some, if rigidly enforced, inflict hardship, while, on the other hand, they contain no enactment respecting such subjects as foundations, drainage and sanitation, which vitally affect the health and welfare of the community. Hence when, in August, the President of the Local Government Board courteously forwarded a copy of the proposed Consolidation Bill and invited suggestions thereon, I did not hesitate, after consultation with Mr. Cates and the officers of the practice standing committee, to represent the importance, or rather the necessity, of accompanying this measure by an Amendment Bill, inasmuch as only by means of consolidation and amendment can the Building Acts meet the requirements of the present day. The practice standing committee, during the last two years, has been engaged in the serious task, involving great labour and research, of preparing a complete draft of a suggested Amendment Bill; and this, when it has been approved by the Council, will in due course be forwarded to the President of the Local Government Board. Let us hope that the issue may be the introduction in due time of a Consolidated and Amended Building Act, such as the necessities of the time require.

A review of the architectural events of the year would be incomplete without some reference to the new departure of the Architectural Association embodied in their curriculum. The subject being one of considerable importance, not merely to the Association, but to the profession, we were glad to afford every facility for its full discussion in this room towards the close of last session. The able and lucid exposition then given by the president, Mr. Baggallay, and the exhaustive discussion which ensued, render it needless to attempt any delineation of the scheme now, and I refer to it only that I may embrace the opportunity of heartily commending it to the sympathy and support of members of the profession.

Among the numerous architectural competitions of the past year, there is one which, alike from the magnitude of the work and from the manner in which the competition was inaugurated, deserves more than a mere passing notice. I refer to the limited competition for the completion of the South Kensington Museum.

In a national work such as this, no one could have cavilled had the Government themselves nominated the architects who were to be invited to engage in the competition, but they were evidently actuated by the desire to make the best as well as the most fairly representative selection. Hence, having limited the number of competitors to eight, they nominated four, and requested the Council of the Royal Institute of British Architects to nominate the other four. This laudable desire to consult the profession through its representatives in a matter of national importance is, I think, highly creditable to the Government, and demands recognition at our hands.

The Congress of Hygiene and Demography which was held in London in August, and proved so great a success, treated of some subjects which are of interest to members of our profession.

The consideration of open spaces occupied some of the time of the Congress. Essential as it is, however, with the view of promoting the health of the community, to provide parks and gardens wherever practicable, it is if possible even more so to make our streets worthier of the name of open spaces than they can now be said to be. Narrow streets and lofty houses are the natural and inevitable result of concentration. When people must live within a prescribed limit it is necessary to pack close; land assumes a fictitious value, and in order to secure a return on capital invested, houses—which cannot be extended laterally—are carried to an abnormal height. This, being the outcome of circumstances which are beyond control, constitutes a difficulty for which it is not easy to suggest a remedy. Something may be done by legislation. The London Council (General Powers) Act, 1890, has already prescribed a statutory limit to the height of buildings, which is so far good as being a step in the right direction. I cannot but think, however, that this limit is excessive, and certainly too great to exercise any hygienic effect. In theory the true restriction would be to regulate the height of buildings by the width of the streets in which they stand, but obviously such a rule could not be applied to London without inflicting injustice. It is necessary, therefore, to prescribe a general limit, and to allow no departure beyond it except with the sanction, specially obtained, of the County Council; and I should be disposed to advocate that such limit should be fixed at 70 feet instead of 90 feet, as prescribed by the Act of last year. We cannot, however, hope to effect much in the direction desired without the sympathy and concurrence of landowners. The interest of the freeholder is no doubt to get as much as the leaseholder will give. But it is no less true that the real interest of the landlord is not always best consulted by the exaction of the full pound of flesh, and I would venture to suggest that large landowners in London would do well to adopt the more enlightened policy of considering concurrently with their own interest the general welfare of the public, by inaugurating such improvements and granting such concessions as the exceptional circumstances of this huge metropolis demand. In illustration of this, and to demonstrate its feasibility, I would refer to the liberal and enlightened policy displayed by the Duke of Westminster in the management of the Grosvenor estate, by increasing the width of streets and restricting the height of houses. Such a policy means the sacrifice of so much rent-bearing land, as well as the acceptance of a smaller ground-rent than would be obtained without restriction of height; but besides conferring a distinct advantage on the public, it must in the long run react for the benefit of the landowner himself by rendering his estate cheerful and attractive.

Contemporary architecture exhibits vigour and originality of treatment, and many features that command admiration, even amid much that, in London at least, is discouraging. When, for example, we reflect that of the thousands of houses erected yearly in this metropolis, the vast majority are not designed by architects, but by clerks and employés of speculating builders, one is tempted to despair of the domestic architecture of London; and it does seem strange that, in face of this patent fact, the public and the daily press persistently make architects responsible for abortions with which they have had nothing whatever to do. It is bad enough to be deprived of the opportunity, except in comparatively rare instances, of showing what our domestic architecture might be if designed by specially educated artists; but it is monstrous that, although so deprived, we should yet be held responsible for the grotesque productions of men who are uneducated and whose minds are innocent alike of refinement and taste. To bring about so magic a transformation as that the architecture of London might become the work of architects would require the wand of an æsthetic Prospero; but something may possibly be attained by more prosaic means. I understand, for example, that in granting new leases the Duke of Westminster stipulates in his building agreements that architects shall be employed, again setting an example which other large landowners would do well to emulate, not so much on the lower ground of encouraging the employment of architects, as on the higher ground of by means of their employment improving the street architecture of London.

There is such a thing as selfishness in design—it may not be so common as the same quality in life, but it cannot be said to be rare: the indulgence in quaint personal conceits or idiosyncrasies, not necessarily beautiful because novel, instead of the manly effort to curb mere selfish quixoticisms, and to produce results which will be pleasing to the refined taste of others, because in harmony with what is beautiful. But it is surely possible to be unselfish in art as in life, and to indulge in almost infinite variety of treatment without offending the educated taste of others by disregarding those principles of artistic design which the testimony of past generations has approved as contributing to beauty; and we may rest assured that we can only transgress such established canons of art at the risk of probable if not certain failure.

A noticeable instance of selfishness in architecture, although not such as I have now referred to, is afforded by the additions to King's College now in course of erection at the eastern end of the river façade of Somerset House. I know not who is responsible for this building, and I can therefore speak with freedom respecting it; I know not what justification can be urged for it on the plea of necessity; but I do know that to have studied the requirements of accommodation only, without regard to cherished surroundings, is, in such a case, selfishness of the worst description. One would have fancied that the façade of Somerset House, which has been admired by past generations, as it will continue to be by generations yet unborn, would at least have been held sacred from innovation or injury, but in this, as in many other things, we live to learn; and it is with astonishment and grief that I see what I regard as one of the grandest public buildings in London wantonly sacrificed to the unneighbourly selfishness of modern utilitarianism. Should it be possible still to take action with the reasonable prospect of a successful issue, I shall be glad to join in any movement having for its aim the removal of a structure which cannot fail to excite the indignation, not merely of lovers of art, but of all, because our public buildings are trusts for the protection of which each generation is responsible.

Mr. ALFRED WATERHOUSE, R.A., late president, said he considered it a great honour to be one of those called on to

give expression to their feelings of gratitude to the President for the address he had just delivered, and which had been listened to by all of them with so great attention. It was a noble address which they should not listen to once and then forget, but they should read over and over again, ponder over it and endeavour to carry its precepts into practice. He should not attempt to traverse the ground gone over in the address, it would only weary them. One or two remarks he would confine himself to. First he would call attention to what the President had said on the controversy that appeared in the *Times* whether architecture was an art or a profession. None among them, and none of those who took part in that controversy could regret it had taken place when they listened to the words of the President in treating the subject and his definition of the ideal architect as a three-sided creature, an artist, a skilful constructor and a man of business. Those words seemed to sum up the whole controversy in a nutshell. If there are any outside the pale of the Institute who thought that the members were devoting themselves too much to science and to business, why did not they come within the pale and restore the balance? The examinations, hitherto so successful in their results, were destined to be still more successful when the progressive examinations came into force and students obliged to begin systematic study from the commencement of pupilage. The Fellows of the Institute would in future times be drawn from the ranks of distinguished Associates, but he hoped the Institute would always reserve the means of opening the door to architects of extraordinary ability who might not be able to enter by the ordinary way. As to the Board of Examiners, all of them, he thought, would echo the President's words. What they had done was beyond all praise and beyond any remuneration they were likely to receive at their hands. Mr. Waterhouse proposed a vote of thanks to the President for his address.

Colonel Prendergast seconded the vote. He urged the importance of a better understanding of architects by the public and expressed his pleasure in hearing the President call attention to the flagrant case of one of the noblest buildings in Europe being spoiled by one of the most vulgar of additions. In regard to the lock-out of the carpenters, he said no better arbitrator could have been appealed to. He also mentioned that the President had made it the first condition of his accepting the office of arbitrator was that "the war should cease" there and then, and so allow some happiness to return to the wretched homes which had known none for so long.

Mr. Waterhouse put the vote to the meeting, and it was carried amid hearty acclamation.

The President thanked the members in a few brief words.

On the proposition of Mr. Aston Webb, seconded by Professor Kerr, the following resolution was passed :—"That this meeting desires to call the attention of Her Majesty's Office of Works and Public Buildings to the injury now being done to the architectural effect of the river front of Somerset House by a building in course of erection at the east end of it under the authority, it is understood, of King's College, and hopes that steps may yet be taken to mitigate this injury."

The meeting then closed.

THE ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the Association was held on Friday evening, Mr. F. T. Baggallay, president, in the chair.

Donations to the general fund and to the library were announced, and the thanks of the meeting awarded to the donors.

The following gentlemen were elected members—Messrs. J. Richardson, A. R. Hill, F. H. Mercer, R. A. V. Harrison, C. O. Nelson, W. C. Bigg, D. Horn, F. A. Whitwell, W. Hodgen, W. O. Thomas, W. D. Colmer, C. E. Hutchinson, W. Carpenter, A. St. Quentin, C. S. Joseph, T. Henwood, F. D. Clapham, G. E. Withers, A. M. Watson, J. Blyth, S. E. Knott, F. S. Hammond, E. Tyler, T. Ballantine, R. H. E. Hill, R. Angell, R. F. Summers, R. E. Walton, A. Gilbertson, E. W. Lees, W. K. Shirly, A. H. Hawkins, A. J. Johnson, F. A. Meakin, W. V. C. Smith, C. Kensington, A. E. Hodson, U. C. Wood, O. F. Stenning, R. P. Griffiths, T. N. Dinwiddy, E. S. Austen, E. C. Lall, E. G. Simpson, M. Zimmermann, W. J. Childs, T. J. Fox, N. W. Harrison, H. P. G. Maull, R. Robertson, E. Whitle, G. C. Beresford, L. Shruffrey and H. N. Kerr.

The President announced that whatever course might be followed in future under similar circumstances, the committee had decided to nominate Mr. Farrow for re-election as vice-president. The statement was received with acclamation.

Mr. W. H. Bidlake, M.A., then read a paper on

Pitfalls on Commencing Practice.

The first great question with the newly-hatched is, he remarked, to get a client. You must have put up a house for somebody before anyone will trust you to put up a house. The wisest course is not to commence until you have secured your first job from an old family friend, or won it in competition. Dead charges must be kept as low as possible. Better to share an office in a good neighbourhood than have a garret to yourself up a break-neck staircase, and "taking in washing" for other architects as evening work will pay office expenses better than going to the theatre. When at last a client calls, first impressions are everything; personal dress and manner, evidence of order and system in the office, readiness to grasp ideas, and that indescribable air of confidence in self, which wins the confidence of others. Above all things, beware of unpunctuality; every excuse for it falls flat. It is well to get to know something about your client. Had I done so on one occasion I should have avoided a pitfall. For my client got more than I did. He got five years' penal servitude, and I only got my expenses as a witness, less 4*s.* 6*d.* for the warrant, and with the balance I bought my experience. After giving his ideas, a client always says he has very little money to spend, and wants the work done as cheaply as possible. The reason he says this is because there is a deep public distrust of architects about money matters. He would not be satisfied if you took him at his word. What he requires is his full money's worth in arrangement, construction, material and design. At the same time, very clearly understand his meaning on the money question, and remember Cutler *v.* North. A building enterprise is quite a novelty to him, and he comes to an architect to be told how to set about it, and trusts him to see him through with it without either loss or embarrassment. His ideas are often very vague and unpractical. You have to help him to define what he wants. Sometimes you will have to save him from himself, to even assume a kind of authority over him, and say: "That would not do; this must be so." He will come with a pet idea, which he has been nursing with pride. You see at once the impracticability of it; but don't contradict him. You may offend, but you will not convince. Best to conciliate with a compliment or a graceful remark, before saying anything unacceptable. If you take his idea, and it is unsuccessful, he will forget its parentage and reproach you with it; or he will say, and rightly so, "I came to you, as a specialist, to be advised." If, on the other hand, his idea is successful, do not be surprised if he takes credit for the whole work, plan, design and all. Have a distinct understanding about your personal retainer and the scale of remuneration. If the arrangement is in any way unusual, have its limits well defined. Endorse any verbal agreement by a letter, and keep a copy of it. Some architects regard their clients with feelings akin to antagonism. This is a most dangerous state of mind to begin with, and fruitful of evil. Your relationship with your client is intimate and confidential. Make him your friend. Be perfectly open with him, and make him conversant with all the steps of the undertaking. Throw yourself with enthusiasm into his interests. Forget that you are working for a definite remuneration. If you are doubtful as to how to act on any occasion, imagine yourself to be your client for the time being, and, whatever befalls, it would be suicidal to quarrel with him. If first impressions are important, parting impressions are still more so. Always part friends. You will avoid a difficulty if you explain to him very clearly the question of "quantities," the extra 1½ or 2 per cent. will give him a shock at first; for, in all probability, he will be quite ignorant of the custom. Let him understand that you employ a surveyor as his agent; that if the contract is executed the contractor will pay the surveyor, but that if it is not executed it will devolve upon him to do so. Take care you do not entangle your client with the authorities or his neighbours. Look well to the question of street frontages and party walls, and be very cautious with underpinning. If any bill for damage is presented, he will be very angry with some one, if only for the relief of his feelings, and that some one will be his architect. The question of "ancient lights" presents a peculiar difficulty in the light of a recent legal decision. The architect is placed on the horns of a dilemma. He may either advise adjoining owners of the extent of his building, and so bring various exacting claims upon his client, which would otherwise never have been preferred, or he may ignore the question of "ancient lights" and incur the risk of having to mutilate the building to accommodate them, when it is more or less complete, with the certainty of a good quarrel with his client, and the possibility of an action by the latter to recover damages. The best thing to do is to discuss the matter very fully with the client, and allow the responsibility to rest with him. In fact, one-half the pitfalls into which the architect stumbles arises from the want of a full discussion and a clear understanding. Mere verbal agreements are often worse than useless—the two disputants are sure to have different versions of the same interview. Have everything in black and white. Do not trust in the honour of your friend or client in a question of moment, for however honourable he may be, you are sure to quarrel with him in the end. No; endorse verbal agreements by a letter and keep a copy, and enter an account of the interview or any important particular into your diary. And a diary, by the way, should be an indispensable adjunct of every

office. Letter-writing is either a virtue or a vice. It is a good servant and a bad master. When the writer is not known personally, his character is implied from his letter. Frequently letter-writing keeps an architect in touch with his surroundings, and a client is flattered by receiving a letter from time to time, and feels assured of his architect's interest in the work. But remember that, when posted, a letter is beyond recall, and—for good or evil—you are wedded to the opinions expressed in it. I try myself to get into the habit of regarding the possibility of every business letter being brought into a court of law. Clients are always in a hurry to commence work. Do not encourage it. Preliminary drawings are not to be dashed off against time, as you commit yourself by them to the broad lines of your design. Prettily got-up sketch drawings are a delusion and a snare. You are gratuitously preparing your client for disappointment. And, as for an estimate of cost, it is like an infernal machine, and is not to be handled with light-hearted carelessness. Do not commit yourselves to figures when you can help it; but, if you do, be sure your figures are correct. You may depend upon it you will be held to them afterwards. Do not court responsibility, it is a golden rule for an architect; and beware of lady clients. Precautions desirable with a client become imperative with a committee. It has been observed that committees and corporate bodies are sometimes capable of meanness and questionable transactions which each individual member would repudiate in private life. An architect must study men as well as materials, for he has to do with both. The committee meeting is a field for his tact, and it is often required. Meetings of educated business men are usually agreeable and methodical, but less educated men rush into windy talkativeness and open contention. Let the greengrocer have his talk out; it is his first opportunity of expressing his opinions to a wider circle than his own fireside. But do not descend to the fray. Do not commit yourself until the fight is over, and then, in the lull after the storm, your words will break upon the stillness with a clear and incisive authority. A committee usually consists of one who leads and the rest who follow, and it is the leader, of course, that the architect has chiefly to reckon with. At the same time, he must hold himself perfectly independent. Once let an architect sacrifice his independence, and pitfalls will yawn around him on all sides. Do not receive any instructions whatever from an individual member of a committee unless you have proof of his being officially authorised to give them; and especially remember that nothing but the corporate seal will bind a corporation. If you are acting for a body of men, you must manifestly be instructed by them as a whole; the majority may repudiate the opinions of the individual, and throw the responsibility on you for having listened to them. Do not work for charity. Bricks cost money, so must brains. Besides, man cannot appreciate what he does not pay for. Neither make your remuneration subject to approval, or to the correctness of your estimate of cost. You may find, to your dismay, that, although you have prepared three sets of drawings, or any number of sets, and have spent endless trouble, the mere "not approved" of your client will annul all claim for remuneration. But, as you have voluntarily submitted to the arrangement, you have only yourself to blame. To the architect who has started in practice with few friends and less capital there comes a pinch which tests his fibre. It is just then that he is tempted to work "for charity" and on approval, in the hopes of getting a connection, and there will never be wanting those who will take advantage of his embarrassment. Accepting trade discounts and less remuneration than the legitimate 5 per cent. compromises his independence, and will be as an albatross round his neck for all his future career. With regard to the former, it seems to me better to have nothing to do with them, even if the client fully understands their nature and accepts the benefit of them himself. But on this point opinions differ. As for building speculation, touch not the unclean thing. Second-rate solicitors and impecunious builders are the best combination for that. With regard to the working drawings, it is a mistake to make them too showy or artistic. They are only a means to an end, and the end is that the building shall be worked out accurately from them. It is also a mistake to show too much detail on the eighth-scale drawings. At the same time, they must be thoroughly thought out and worked out, or else the architect will find himself in the deadly grip of "extras." If a thing will not work out satisfactorily on the drawings, it is a fallacy to suppose it will come right in execution; and the less ambiguous the drawings are, and the less they are left to the interpretation of the architect, the less disputing there will be with the builder. Do not accept the accuracy of plans or maps on the assurance of other people. Plot out the site for yourself, and do not try conclusions with the authorities. Sometimes one is tempted to sacrifice convenience to design. It is a pitfall. Beware in time. Either rearrange the parts so that the two do not clash, or else face the inevitable at once. If you do neither, some ghastly deformity will be arranged by your client to remedy the inconvenience. And who is to blame? If you build your chimney so low that it smokes, be prepared for the deformity of a cowl. Be sure of your construction. You are responsible for it. It is of course false economy to stint the strength or stability of the construction for the sake of ornamental character. In house-planning a wise architect takes the ladies into his confidence. Their chief requirements are plenty of cupboard-room, well-lighted steps to the cellar and a kitchen on the ground floor. Be sure and have plenty of head-room for staircases. On one of your visits of inspection the foreman will come up and say, "If you please, we can only get 6 feet head-room for the back stairs; we've tried it all manner of ways." And just then the client walks up from behind and says, "What's the matter?" Single steps and single winders are dangerous, and are generally signs of thoughtlessness. Warm the staircase, or the house will never be free from draughts; and if there is an unusually large surface of window in a sitting-room, such as a bay window, the cold radiation of the glass will always produce draughts if no special arrangement of hot-water pipes is introduced. Shut off the kitchen offices from the rest of the house and well ventilate them, or the smell of cooking will pervade the house. If the journey from the kitchen to the dining-room is long or circuitous the dinner will be cold. Place the bath-room over an unimportant room, so that if the bath overflows no great amount of damage will be done, and take precautions against water in the cellar. Consider the position of the furniture in each bedroom, and treat domestic servants as human beings, worthy of more comfort than a cheerless garret affords. If an architect is to avoid extras, a clear, concise and comprehensive specification is an absolute necessity, and it seems to me that the growing practice of entrusting it to a quantity surveyor is very much to be deprecated. An architect has not thoroughly thought out his building until he has written the specification for it. And when he has done that with great care, although not necessarily with great elaboration, he feels a sense of repose and confidence in the execution of the work not to be attained otherwise. In a specification vague terms are expensive items. To suppose a builder will adopt a better and more costly method of execution, unless you specify it, is to be too flattering to human nature, and to suppose that, even if you do specify it, he will execute it so unless you see that it is done, is to show some ignorance of the builder-nature in particular. Of course, there are exceptions to every rule. Do not try experiments in new materials and inventions. Let others do that. If you do it, it will probably be at the cost of your client's pocket and your own reputation. And, above all, allow for contingencies. If a thing is absolutely perfect, except under certain circumstances, those circumstances are bound to arise. When the working drawings and specifications are complete, let your client have both to look through. Better to make a modification even at the eleventh hour than that your client should not be satisfied, or that the alteration should be made after the contract is signed. Obtain an expression of his approval if possible; it may help to relieve you of responsibility. In connection with the actual building there are a hundred possibilities of oversight, which may lead to consequences most disastrous to the architect's reputation, but which a little care and attention to details might have avoided. Undoubtedly, the architect's position is a difficult one. Many are the operations in a building enterprise, and many are the hands engaged upon it. Each is liable to error or neglect, and, however attentive the architect may be, it is impossible for him to be always inspecting the building. And so matters of error or neglect become covered up and obscured in his absence, even if they are not wilfully hidden from him. Yet it is he, and he alone, who must bear the responsibility before the public. And the public will not stop to inquire into the difficulties of his position. "What is the good of having an architect?" will be the contemptuous question. And, although his building is admittedly excellent in plan, design and execution, yet all the good that he has done will not be remembered to him if a chimney smokes or the water comes into the cellar. This may be unjust, but it is a matter of experience. It behoves the architect, therefore, to pay minute attention to the details of construction, arrangement, ventilation, and the like, and to be very sure he is using good materials. If he has not used good materials, time and weather will soon expose the fact to the public. A correct judgment of materials can only come by experience, and even the most experienced are sometimes at fault. It is, therefore, all the more necessary to make the question one of close study. It is a misfortune that the education of an architect does not comprise a study of the distinction between good and bad material. Might not a museum of common building materials, good and bad, be a useful aid in the new educational scheme of this Association? Do not condemn the material unless you are sure of your judgment. A little friendly consultation in private with a man of experience will be very valuable. Although it is folly to allow bad material, it is possible to be hypercritical. An architect, like blindfold justice, must hold the scales equal between builder and client. It is a good rule to imagine

the builder present in all your dealings with the client, and *vice versâ*. Be sure of your foundations. Test the ground yourself. If you come to a soft part, have it cut out, and concreted, or the brickwork carried down; and step the brickwork from the higher to lower level. See that the footings are in, and have a greater spread where greater weight has to be carried. Beware of drawing off water from the foundations in sandy soils. It will be too late to think of these matters when the cracks of unequal settlement have appeared. Take the same precautions with drains. Have them tested in your presence. If they pass under a building, arch the walls over them; if they pass over new-made ground, carry them on concrete or on brick foundations. See that these things are done, and do not take the builder's assurance. Be sure that the damp-course is in, and see that the brickwork is built solid round all smoke-flues in hollow walls. If smoke once finds its way into the hollow space, it will be impossible to find the leakage, and endless annoyance to the client may be the result. Examine every fireplace to see that joists and purlins are not built into the flues or too near them. Tie in wall-plates, so that the roof will have no tendency to spread. See that roof principals have sufficient abutment, or efficient tie-rods. Take care that the mason has not cut the beds of a column hollow in order to obtain a fine joint, or the stones will fracture. If you have to argue yourself into the assurance that a beam is strong enough, you may take it that your judgment says it is not; therefore, make it stronger. When the roof-tiles are being laid, take care that the mortar-bedding does not extend too far down. If it does, water will be conveyed through the roof and drip on to the ceilings, and the client will write a letter to his architect acquainting him with the fact. The roof will have to be stripped. I do not think there is any other remedy. Take great precaution in plastering the interspaces between the rafters of church roofs, and allow a good air-space between the laths and tile-battens. Beware of internal gutters, and pockets where snow can accumulate. Carry chimneys well up, and give them some mass and breadth. The modern chimney is distinguished by its leanness. Guard against water soaking through brick sills, or driving under casements, or condensed moisture dropping from sky-lights. See that water-pipes are not exposed to frost, and do not trust any one but a thoroughly competent man to fix the kitchen cylinder, otherwise you will get into hot-water. Keep the gas-meter away from any source of heat, or the water will distil into the pipes, and there will not be a steady gas-flame in the house. Do not lay a wood-block floor until the concrete bed is quite dry, or the wood will swell and the floor "rise." And, above all things, beware of dry-rot. For a man who has spent a considerable sum in building a house to have to spend another 50*l.* on new floors and skirtings before he can inhabit it, will prove a great strain on his composure; and it would be an even greater trial to a committee which had collected its scanty funds with the greatest difficulty, to see them swallowed up by this seven-headed hydra without a murmur against the architect. Do not trust to caretakers; they are not to be supposed to have any intelligence. They will stop up the ventilation openings if they can, or else allow them to get choked with dirt. For the sake of your own reputation, urge your client or committee to have a periodic examination of all such air-inlets and of the under floor-space. The latter can be arranged by having movable floor-boards screwed down. You might also take similar precautions with regard to running the water out of heating coils on frosty nights, and also with regard to domestic servants letting soap, hair and the like get into sink waste-pipes. I now come to what is, perhaps, the most frequent and insidious pitfall of all, the accumulation of "extras." It is almost impossible to avoid extras, to some extent; but there is a reasonable limit beyond which they must not pass. Contingencies often arise which it is impossible for an architect to foresee, and no reasonable client would object to extras for such, even though he did not like them. When, however, an architect, in order to improve his design, incurs a heavy extra for a modification in the plans which his client has approved, he incurs a serious responsibility, and he may find that he has to refund the cost of his indiscretion. It is the wisest course to keep your client fully aware of the extras as they arise, and to obtain his sanction first to all those that are not quite trivial. If possible, obtain an estimate of extra work beforehand and submit it to your client for approval, and insert a clause in the contract that all extra work is to be valued at the same rate as that on which the tender is based. It is certainly most unreasonable to spring a considerable extra expense upon a client incurred by his architect without his knowledge. In order to avoid any difficulty whatever, make the payment of extra work contingent, by the terms of the contract, on the architect's written order, and insist upon this procedure. At the same time, advise your client that he has no power to give any orders except through your agency. It will avoid disputes if you afford both parties to the contract the opportunity to fully study its contents. I have been surprised to find it necessary to ask builders to read through an agreement before signing it. For the architect himself, it is most important that he should be under no obligation whatever to either parties of a contract. He must not only be impartial, but give no occasion to the suspicion of partiality; keep strictly to the terms of the contract, and avoid the law like poison. I will not notice the questions of dilapidation and valuation further than to point out the caution required in dealing with them. If the public is induced to invest its money in any enterprise on the strength of your valuation, and this should turn out to be altogether too visionary, you will have incurred a heavy responsibility. If you are doubtful on the subject, it is better to pay for good advice. There is danger in trying to be a universal specialist. Find good brains, use them, and trust them. Before concluding, there is one more question to consider: That of giving certificates. Always keep good security, and keep well in view the contingency of the builder's failing before completing the contract. If you do not, you will have involved your client in embarrassment. Be very cautious in giving the final certificate. It is the client's acknowledgment, through your agency, that the builder has completed his part of the contract, and it debars him from any further claim. Pitfalls will come as long as it is human to err; but if an architect refrains from compromising his independence, pays attention to details, and never trusts to a verbal or ambiguous agreement, and will not allow himself to be persuaded against his judgment, he will avoid very many of them. It is easy to be wise after an event; to be wise before it is to learn from the experience of others.

A short discussion followed the reading of the paper, in which Messrs. H. O. Cresswell, E. Woodthorpe, Arnold B. Mitchell, F. T. W. Goldsmith, Leonard Stokes (ex-president), A. J. Bolton, C. H. Brodie and the President took part, and a hearty vote of thanks was accorded to Mr. Bidlake.

THE ALBERT GATE BUILDING.

IN the Queen's Bench Division, before Lord Coleridge and Mr. Justice Wright, on Wednesday, the action, Archer and Another *v.* J. W. Hobbs & Co. was heard. This was a dispute, says the *Times*, between the "building owners" and the architects of the enormous building in course of erection at Albert Gate, Hyde Park (nearly opposite Sloane Street), the great dispute being whether, the owners having told their architects that the cost of the building was not to exceed 100,000*l.*, the architects had been guilty of negligence or want of due care and skill in allowing the expense to amount to 200,000*l.*, which had been the actual expenditure. It appeared that the building had been undertaken and begun without specifications and detailed estimates upon "quantities" actually "taken out," and the case is important, because it was laid down again and again by Lord Coleridge, and appears to have been in a great degree the basis of the decision, that if a building owner desires to limit his expenditure on a building he should have detailed specifications and estimates on "quantities taken out," and stipulate expressly that there shall be no expenditure beyond, unless allowed by written orders either of the employer or his architect. In the present case it appeared that the building was to be erected by Hobbs & Co. as a speculation, and that there had been, in March 1887 some general preliminary discussion between the architects and the building owners—Hobbs & Co.—and that the architects had stated generally that a large building of the size and character contemplated might be erected at an expense not exceeding 100,000*l.*—that is, at the rate of 10*d.* per cubic foot of the total cubical area, which, upon such a building as was contemplated, would work out to something like 100,000*l.*, though, it was said, it might possibly cost 115,000*l.*, and the scheme was that the building should be sold for 132,000*l.*, so as to leave a profit to the builders of about 17,000*l.* That discussion was in March 1887, and was only general and hypothetical; but in November 1887 Hobbs & Co. having considered the matter, wrote to the architects that they did not intend to expend more than 100,000*l.* upon the building, which was then intended to be on the site vacant at Albert Gate (the ground-rent of which would be 5,000*l.* a year), and which it was intended should be let out in flats or different suites of apartments on the same or different floors. The work was undertaken and commenced in November 1887 upon a general sketch-plan of the "elevation" and the dimensions of the building upon the site designated, with a certain number of floors, without detailed working plans and specifications and estimates on "quantities" "taken out" in the usual way, the owners having stated their intention that the expense should not exceed 100,000*l.*, and that there should be no extravagance. The architects were to have 4,500*l.* and an additional 1,700*l.* if the building sold for 132,000*l.* The work went on through 1888, 1889, 1890 and 1891, and it is not even yet entirely completed, and the expense has amounted to 200,000*l.* In 1889 the expense incurred was 60,000*l.*, and it could be seen that the

building could never be completed for 100,000*l.*, and in 1890 it was seen that it would cost 160,000*l.*, and in the result it has amounted to 200,000*l.* The architects sued for the sum of 1,000*l.*, the balance of the 4,500*l.* they were to have. The building owners resisted the claim on the ground that the architects had been wanting in care or skill in estimating the expense, or in keeping the expenditure within the 100,000*l.*, and there was a counter-claim for the alleged negligence. The case went to the Official Referee, before whom it was contended, on the part of the defendants, that, though there was no guarantee or warranty that the expense should not exceed 100,000*l.*, the architects had not used due care and skill in confining the expense to that amount. The Referee, however, thought that there was no negligence imputed except in not limiting the expense to 100,000*l.*; that the defendants must have seen before long that the building must cost far more than 100,000*l.*, and that there was nothing in the alleged defence or counter-claim; and he, therefore, found for the plaintiffs, the architects, for the amount they claimed. The defendants, the building owners, appealed.

Mr. William Graham and Mr. Bonner appeared for the defendants in support of their appeal. With reference to the finding of the Referee, that they must have seen that the expense must exceed 100,000*l.* when at the end of 1888 it already came to 60,000*l.*—that might be true; but what were they to do? It was too late to abandon the design, and it would have been a dreadful disaster to have to pull the building down and begin again. The architects were bound to use reasonable care and skill in keeping the expense within the limit fixed by the employer, and surely it was not due care or skill to allow the expense to be doubled. It was clear, however, from the report of the Referee that he had repudiated any such duty or liability, and that was an error in law which vitiated the report. [Lord Coleridge: There were no detailed plans and specifications on which quantities could be taken out and detailed estimates given, and if the employer desires to keep the expense within a certain limit he should have such specifications and estimates, and stipulate that the sum estimated shall not be exceeded without written orders signed by himself or his architect.] The architects themselves made out their own specifications as they went on with the work. The owners could not know what would be the excess of expenditure; the architects were bound to know. [Lord Coleridge: The owners must have known before long that their limit would be exceeded, and they allowed the work to go on, and it was admitted that the work done was well worth what was charged.] That is so; but still, can it be said that the architects performed their duty when they allowed the sum limited to be doubled? Upon that question the Referee has really never decided; indeed, he repudiated any such duty, and said, again and again, that there was no such implied contract—that it ought to be put into a written contract. He treated it rather as a question of warranty or guarantee, not one of negligence or want of due care and skill; and as to that he did not find.

Mr. M'Call, Q.C. (with Mr. Edward Pollock), appeared for the plaintiffs in support of the report of the Official Referee, and argued that in effect he had negatived the alleged negligence.

The Court as to this communicated, during an adjournment, with the Official Referee, and on their return

Lord Coleridge said the Official Referee had told them that he had not formally or expressly found upon that question (apart from any guarantee), and though there could be no doubt what his finding would be, it would be safer to send the case on that point back to him. Case accordingly sent back for the Official Referee expressly to find on that point.

NEW BUILDINGS.

Glasgow.—The orphanage just erected at Whiteinch, in connection with the Glasgow Institution for Orphan and Destitute Girls, has been opened. The new home stands on an acre and a half of ground at the west end of Victoria Park, an excellent site, of which advantage has been taken in planning the building to obtain a south-easterly or south-westerly exposure to all the principal rooms, which thus have almost all pleasant views over the park. On the ground-floor are the living-rooms and other necessary accommodation. The system of small dormitories has been adopted, six in all being provided for the sixty girls. The bedrooms are on the first and attic floors, special provision being made for the senior girls, and there is ample lavatory and bath-room and other conveniences on each floor, while the sick-room on the first floor commands a delightful prospect of the park. Externally the building forms an imposing pile in red stone, with darker red dressings and high-pitched green-slated roofs. The architecture is Scottish Domestic of a simple type. The architect is Mr. S. Henbest Capper, M.A., A.R.I.B.A., of Edinburgh.

Richmond.—The foundation-stone of the new Municipal Buildings has been laid. The buildings, which are to be constructed from the designs of Mr. W. J. Ansell, of Staple Inn, will include a commodious council-chamber overlooking the river, committee-rooms and rooms for the various borough officials. The buildings will be of the Elizabethan Renaissance style, the front faced with red bricks, having terra-cotta or stone strings, cornices, &c., and the roof covered with red tile ridges. The contract cost of the buildings is 13,000*l.*

Tunstall.—Public buildings erected at Tunstall in commemoration of the Queen's Jubilee have been opened. The buildings cover about an acre of ground, are Renaissance in character, and comprise three blocks—the Victoria Institute, fronting Station Road; the public baths and fire-engine station, with a frontage to Bath Street; and the volunteer armoury, town yard, with workmen's dwellings, stables, cart-sheds, &c. The contractors were Messrs. Yorke & T. Goodwin, of Tunstall. Mr. A. R. Wood, architect, Tunstall, designed the buildings.

GENERAL.

Mr. G. O. Reid, A.R.S.A., has been commissioned by the Queen to paint a picture of the baptism of the son of Prince and Princess Henry of Battenberg.

The Annual Exhibition of the Herts Society for the Promotion of Art took place last week.

The Sixth Annual exhibition of the Wolverhampton Society of Artists was opened on Monday in the north room of the Municipal Art Gallery.

Mr. Alma-Tadema, R.A., was, as president, to have attended the meeting of the Wednesbury Institute on Thursday and deliver an address on "Art in its Connection with Industry"; but, in consequence of the illness which kept him away from the inauguration of the Art Gallery in that town, he was not able to fulfil his engagement. His address, however, was forwarded to be read to the members of the Institute.

A Studentship, provided out of the funds of the Newton Testimonial Fund, having been offered to the University of Cambridge by the managing committee of the British School at Athens, the Craven Committee will proceed to make the appointment in the course of the present term. The studentship is of the value of 50*l.*, and is tenable for one year. The holder will be required to reside at Athens for not less than three months during the ensuing winter and spring, and to conform to the rules and regulations of the school.

Mr. T. Locke Worthington will give a course of twelve lectures on "Architecture as Demonstrating the Manners and Customs of Nations," at Hampton Court Palace. The first lecture will be given to-day at 2.30 P.M.

Sir J. Whittaker Ellis, M.P., on Saturday laid the foundation-stone of the Municipal Buildings in Richmond, which are to cost 13,000*l.*

Captain Shaw has been appointed Knight Commander of the Order of the Bath.

Mr. Brunner, M.P., has offered to present to Middlewich a house, with ground adjoining, for the purposes of technical education and recreation.

Professor Flower's Report on the condition of the University Museum, Oxford, has been published.

Mr. F. G. Jackson, of the Birmingham Art School, read a paper on "Art Education in Relation to the Industries" at the meeting of the Birmingham Art Ramblers, of which society the late Mr. Henshaw was an honorary member.

The New River Company have agreed to open the New River Head in Clerkenwell by taking down the obstructive enclosing walls, and substituting a suitable dwarf wall and railings.

The Belgian Government have promised to the town of Ostend the gratuitous cession of the ground necessary for the construction of a new dock, and to grant a subsidy of 3,000,000 francs towards the construction of the new quay.

A Cast of the Model executed by the late Sir J. E. Boehm for his statue of Mr. Charles Darwin has been presented to the Cambridge University by Mr. Darwin's family, and has been temporarily placed in the lecture-room of comparative anatomy.

The Annual Conversazione of the Lancashire and Cheshire Antiquarian Society took place on Wednesday evening. The retrospect of the work done by the Society during the past year was of a highly satisfactory nature.

New Schools have been erected at Wigston, and the most careful attention has been paid to the ventilation, so that it may be as perfect as possible, the extraction of the vitiated air being effected by a number of the direct-acting turret ventilators of the "Climax" Ventilating Company, 15 Great George Street, Westminster.

An Oak Chancel-screen designed by Messrs. Wood & Kendrick, architects, has been placed in the parish church, West Bromwich.

The Architect.

THE WEEK.

THE Rev. COPELAND BOWIE has raised some questions about the tendering for London Board Schools. It appears that in 1884-85 the number of tenders received for a building ranged from nineteen, as in the case of the Trafalgar Square Schools, to twenty-seven for the Upper Kennington Lane School. But for the period 1888-91 the largest number of tenders was eight, while only three were sent in for the Randall Place School. One effect is that a few contractors engross the building. It is found that Messrs. LAWRENCE & SON'S contracts amount to 85,923*l.*; Messrs. BULL & SON'S, 75,983*l.*; Mr. COX, 71,254*l.*; and Mr. LOVATT, 54,188*l.* Mr. COPELAND BOWIE asks whether the system does not create an unfair monopoly, bring in provincial firms to the exclusion of London contractors, and reduce the employment for metropolitan workmen? He ought to have known that the system of unlimited tendering had to be given up on account of the deviations from honesty which masters and workmen pursued. If the Works Committee find that better work is obtainable under limited tendering, in the interests of the ratepayers that system should be followed.

THE *Return from Calvary*, by Mr. H. SCHMALZ, which is to be seen at DOWDESWELL'S Gallery, has little in common with the Italian paintings of Scripture scenes. The troubled sky and the background of Jerusalem, with its crowds of spectacle-seekers, divide the interest, which formerly would be attracted by the figures alone. But on that account the picture has more of a modern air. The VIRGIN is represented as being accompanied to her home by JOHN and MAGDALENE, and as overpowered with emotion. But her companions do not give much heed to her sufferings. JOHN holds her arm, but his gaze is on the distant crosses, and MAGDALENE is occupied with her own grief. JOHN is depicted as a manly person with a dignified head. The best figure of the three is the MAGDALENE, and the light falls on her face in a manner that enhances the beauty of the contour. The face might have been suggested by the fine outline by DA VINCI in the British Museum. The picture tells its story, but the artist has wisely refrained from imitating the dramatic arrangements of other works which have captivated so many people. The quantity of studies from the Holy Land which are to be seen in the gallery suggest how much preliminary labour was gone through. It is creditable to Mr. SCHMALZ, and will enhance his reputation. In another room are several of Mr. THORN WHAITE'S water-colours. The subjects are from Sussex, Essex, &c., and they have all the qualities which we expect in the artist's work. They might be arranged in two classes—one with landscapes as seen under a glowing light, the other under one that is cold and clear. Mr. LOGSDAIL exhibits elsewhere sketches in oils from the Riviera. In them we see colour which must startle eyes which have not gazed on the Southern Paradise. A year of study in the district ought to be enough to make an artist a colourist. Evidently Mr. LOGSDAIL has benefited by what he saw, and his success should tempt many more to go through the same delightful course.

THE paintings and statues commissioned by the Municipality of Paris for the adornment of civic buildings are so numerous and widespread the citizens do not realise all their importance. The Musée at Auteuil will be found the best place to enable strangers to understand the munificence with which art is patronised in the Municipal Council. The Musée has been increased by the addition of one of the large pavilions which formed part of the exhibition buildings of 1889. In one place are sketches of the wall-paintings in the Hôtel de Ville, mairies, Palais de Justice and schools. Illustrations of many of them have appeared in *The Architect*. In another gallery are to be seen the medals and engravings which the Municipal Council commissioned. Then there are sketches of paintings for churches which up to 1870 were ordered, as well as secular works. Tapestry, paintings, &c., which are the property of the city, are found elsewhere, and in one of the largest galleries some of the paintings for the Hôtel de Ville have been deposited until the rooms are ready to receive them. The pavilion of the exhibition is occupied with casts of sculpture purchased or ordered by the Council, some old tapestry forming a fine background for them. How many centuries must elapse before a similar collection is to be seen in London?

IT is impossible to preserve the amenity of any city unless some latitude is allowed to the authorities, for Acts of Parliament are necessarily restricted in their phraseology, and hardly meet all the cases which arise. The Scottish Deans of Guild have been allowed to exercise a discretion which was equitable in interpreting Acts. A recent decision of the Scottish Courts must have the effect of restricting them to a sort of routine. The case arose out of an attempt to build over forecourts. One of the streets in Glasgow was laid out according to the terms of a deed which stipulated that the roadway should be 50 feet wide, that on each side there should be a grass plot of 20 feet between the street and the houses, so that the distance between the houses should be 90 feet. It was desired to utilise one of the plots as a building site. The Master of Works objected on public grounds. The Dean of Guild, as we stated at the time, thereupon refused to grant the authority for the building, because he held that it was the duty of the Master of Works to bring under the cognisance of the Court any deviation from the existing line of the street in all plans of new erections submitted to the Court, and that it was the duty of the Dean of Guild Court to see that a uniform building line was maintained, and that restrictions as to buildings imposed by title-deeds, and still subsisting, were adhered to. The parties appealed to the Court of Session and were successful. The case was sent back to the Dean of Guild Court for the granting of the building permit. Their lordships held it was outside the duty of a Dean of Guild to enforce provisions in contracts, more especially when no objection was made by the superior or the adjoining landlords. Costs were awarded to the appellants.

FEW officials have more responsibilities than sanitary inspectors; fewer still are so grudgingly rewarded for their services. It too often happens that their tenure of office depends upon authorities who have a financial interest in the evils which the sanitary inspector is supposed to extirpate. It is no wonder, therefore, that the inspectors should be desirous to have the conditions of service arranged in a more equitable way. At a meeting of their Association, which was held on Saturday in Manchester, the following suggestions for the administration of sanitary law were approved:—"(1) That the officers now variously named sanitary inspectors and inspectors of nuisances be designated 'sanitary inspectors'; (2) that all sanitary inspectors be elected to a permanent tenure of office and only be dismissible for misconduct or proved incompetence, with right of appeal to the Local Government Board or a central department of health; (3) that candidates for the position of sanitary inspector shall be required to possess a general knowledge of building construction and a qualifying certificate in sanitary science granted after examination by a Government department; (4) that sanitary inspectors shall be required by law to inspect districts for the detection of nuisances and to serve notices for the abatement thereof, all such notices to be as valid, if confirmed by the local authority, as if served by the authority's order; (5) that the duties of sanitary inspectors shall be clearly defined and regulated by law or by a central Government department; (6) that in all appointments requiring an officer's whole time an adequate minimum salary should be prescribed; (7) that a fund be formed for granting superannuation to sanitary inspectors." There is nothing that is likely to cause danger to towns or districts in the proposals of the Association, and as long as the inspectorships are held on a precarious tenure it is not to be expected that the holders will be courageous in running risks. It would also be an advantage if the desire of the Association could be realised, and broken-down schoolmasters, railway porters or men who had failed at other avocations should no longer be pushed into the ranks of the sanitary inspectors, as if the office were created as a refuge for broken-down friends of Councils and Boards.

MEMORIALS OF EDINBURGH.*

WHEN WALTER SCOTT described Edinburgh as his romantic town he employed the most suitable of epithets. The city is not remarkable for great works of architecture, and few would select any of the buildings for imitation. But the streets of the Old Town especially afford as much pleasure as if every house were a masterpiece. Narrow wynds and closes, that are made dark by tall houses, are admired as picturesque, squalor is not shunned, and steep ascents are accepted as a necessary element in the pleasure of enjoying life in so attractive a place. The criticism which is employed in other cities is set aside in Edinburgh, and in the Northern Athens, as in the ancient seat of Greek civilisation, people judge by their memories rather than by their eyes. The inhabitants prize Edinburgh for its associations rather than for its appearance. Let the visitor be seen gazing at any house, and somebody will appear who will relate a history about its inhabitants. Commonplace houses in back streets or lanes appear to have been the abodes of distinguished men or the stages on which memorable scenes were transacted.

The historic and romantic interest that was attached to the buildings rather than their architectural value inspired the preparation of the "Memorials of Edinburgh" about half a century ago. In the preface to the new edition the author explains the origin of the work when he says:—"Buildings which had survived from older centuries and perpetuated associations of the Scottish capital with national history were being rapidly effaced in the progress of civic improvements;" so drawings were made of the houses to form the illustrations of a work in which the associations were to be recorded. For the sake of archæology it will be regretted that Sir DANIEL WILSON's book was not to be the history of the final demolitions. In the course of the half century which has elapsed since he began writing, civic improvements have cleared away many more examples of the habitations of the old worthies of Edinburgh. It must have been with sadness that Sir DANIEL WILSON penned the following list of losses in the city he loved:—

> Since the appearance of the first edition the palace of Mary of Guise; the haunted dwelling of Major Weir; the lodging of Bishop Bothwell, associated with one of the tenderest of old Scottish ballads; Robert Gowlar's historic mansion, alternately abode of nobles, foreign ambassadors and other honoured guests, and place of durance of men of historic note, throughout the sixteenth century; and that of Sir Thomas Hope, no less rich in memories of some of the foremost men of the succeeding age, have all disappeared. The beautiful Collegiate Church of Mary of Gueldres has given place to a railway station; and St. Margaret's Well, with the legendary virtues of St. Triduana's healing fountain, has suffered a like fate. In truth, the intervening years since these "Memorials" first appeared have witnessed a crusade against nearly all that remained of Scott's "own romantic town." On the northern slope of the ridge along which the High Street runs, Cockburn Street has displaced the old closes and wynds between the Cross and the Tron; and Jeffrey Street has still more effectually completed the work of destruction eastward to the Nether Bow. The great fire of 1824 left few traces of elder centuries on the southern slope between St. Giles's and the Tron; but further eastward the destruction of Blackfriars Wynd has effaced a thoroughfare only secondary in picturesque attractions and historic interest to the quaint old West Bow. The reader needs no chronicler to tell him that all are gone. . . . But happily the picturesque beauty of site which gives so unique a character to the Scottish capital is indestructible; and the sacrifice of so much of its inheritance from elder centuries has begot a spirit of reverence along with some sense of the irreparable loss.

It is inevitable that to street improvements much that is old must be sacrificed; but in past days it is to be feared that old buildings were not saved because it was supposed that the materials could be utilised in some other and more improved ways. Just as in Elsinore the funeral baked meats were turned to account for the marriage feast, so in Edinburgh antique masonry served for modern houses. SCOTT, for instance, was as loving an admirer of the city as could be found within the precincts of the Good Town; but, with all his affection, it is plain, from his statement in the "Heart of Midlothian," that he was not above decorating the entrance of his kitchen-court at Abbotsford with the stones which composed the gateway of the Tolbooth with its ponderous fastenings. Melrose Abbey also was raided, in order to obtain sculptured stones for the same house. SCOTT could find many precedents for attaching antique remains to his property. When the Cross of Edinburgh, from the platform of which so many important announcements were made, was taken down by order of the Corporation in the middle of the seventeenth century, Lord SOMERVILLE seized the shaft, with its capital, and set it up on his estate at Drum. Four of the grotesque heads were built into a tower, and afterwards they found their way to the Abbotsford collection. When some houses in the Lawnmarket were taken down, it was found that for the walls fragments of earlier work were employed, "the carved work being built into the wall, and the stones squared on the exposed side." Many other houses would be found to be made up by the exercise of the like thrift. It must have often happened that the saving from the use of old materials was hardly worth reckoning, but there seems to have been a sort of passion for the practice, as if the degradation of the work of vanished craftsmen was evidence of power, success and cuteness. We give one story which is suggestive of the odd ways of the North:—

> Shortly after the altering of the old front [of the Parliament porch], the late Bailie Henderson observed a cart conveying along the South Bridge a load of carved stones, among which the statues of Justice and Mercy formed the most prominent objects. On inquiring of the carter as to their destination, he learned that one of the professors, who kept a Polar bear, had applied to the magistrates for stones to erect a bear's house within the College quadrangle, and he accordingly obtained a gift of these *old rubbish* for the purpose. The bailie gave the carter a fee to turn his horse's head and deposit them at his own villa near Trinity, from whence he sent him back with his cart full of stones equally well adapted for the professor's bear-house.

After such a transaction we need not wonder that some of the most ancient portions of Holyrood were destroyed in 1753 by the hereditary keeper in order that he might have apartments in another part of the palace which he preferred. Relics of the past should, however, be prized in Edinburgh, for without them it would be easy to say that the city has not a very long history. The English invasion in 1544 was disastrous for the early architecture and the Mediæval work that has survived is not of great value. As Sir DANIEL WILSON says, "If we except portions of the castle, the churches, and the north-west wing of Holyrood Palace, scarcely a single building anterior to this date exists in Edinburgh." But few visitors to Edinburgh can believe that the streets are not representative of all periods of architecture, for in no other city is imagination allowed so much license.

The Old Town of Edinburgh, that is, the picturesque part of the city, consists, as all the world knows, of a tortuous but continuous line of streets from the castle on the west to Holyrood on the east. With the exception of Heriot's Hospital, all the buildings that are associated with the history of Edinburgh are on that line or contiguous to it. The main interest surrounds the High Street.

The castle is so well placed on the rocky hill, as BURNS says:—

> Like some bold veteran, grey in arms,
> And mark'd with many a seamy scar,

its appearance affords a kind of pleasure that cannot be enjoyed elsewhere within a city. The buildings which are visible belong to different periods subsequent to 1574. The esplanade is not older than 1753. The castle was used as a palace, and the first meeting of the Scottish Parliament was held in a hall which measures 84 feet by 32 feet. Sir DANIEL WILSON, when examining the buildings for his "Memorials," discovered the ancient oratory or chapel in which St. MARGARET, the queen, placed the Black Rood containing a fragment of the Cross. It is only 15 feet 10 inches in length by 10 feet 4 inches, and evidently was Norman in style. There was also a larger chapel. The Castle Hill being visible from all parts of the city was selected as a place for executions which were intended to strike terror into citizens. Witches especially were burnt there, and on one occasion no less than five suffered, "all of thame confessant thair covenanting with SATAN, sum of thame renunceand thair baptisme, all of thame oft tymes dancing with the DEVELL."

Near the foot of the hill in Castle Hill, the Grassmarket and Lawnmarket, some ancient houses are still to be seen. One house in Blair's Close is supposed to have been the residence of the Duke of GORDON. It would seem as

* *Memorials of Edinburgh in the Olden Time.* By Sir Daniel Wilson, LL.D., F.R.S.E. New Edition. Edinburgh: A. & C. Black.

if the builders often anticipated a time when the houses were to be let out in "flats or dungeons," for, as Sir Daniel Wilson says, "no feature is so calculated to excite the surprise of a stranger, on his first visit to such substantial mansions, as the numerous and ample flights of stone stairs, often placed in immediate juxtaposition yet leading to different parts of the building." In the district was the palace of Mary of Guise, which was finer than most of its neighbours. It was approached by Blyth's Close, "and through this mean and obscure alley ambassadors and statesmen of England and France and the messengers of the Scottish Queen made their way to the presence of the Queen Regent."

It is the opinion of Sir Daniel Wilson that a peculiar kind of doorhead consisting of mouldings rising to a peak in the centre, like a flat ogee arch, which is to be seen in the Lawnmarket and elsewhere in Edinburgh, marks the handiwork of Robert Milne, the seventh royal mason of his family. Nowadays the Lawnmarket does not appear to be an eligible place for men of genius. But Hume, the historian, was a householder in one of the closes, and in Baxter's Close Burns lived on his first visit to Edinburgh, and was glad to have share of a humble room at eighteenpence a week. They were both, it must be said, indifferent to the picturesqueness of the city. This was perhaps excusable in Hume, but Burns was of another sort. His letters contain nothing about the impression which was made on him by the city, and the Address to the city is almost entirely occupied with the inhabitants. The Lawnmarket led to the Parliament House and St. Giles's Cathedral. Adjoining the latter was the Tolbooth which, if no longer existing, cannot be forgotten while the "Heart of Midlothian" is read. Near it were the Lucken booths, which, according to Scott, were jammed into the midst of the street, leaving for passage a narrow way on the north. In contrast with the huge block were several small booths which were established between the buttresses of St. Giles's. The booths, large and small, must have obscured the church, but it appears that Turner was opposed to their removal, for it was the old High Street of Edinburgh which he considered to be equal to the High Street of Oxford. Sir Daniel Wilson must hold a like opinion, for he says:—"We doubt if its broad and unencumbered thoroughfare will ever again meet with the praise that it received from travellers who had to pass through the narrow defile of the *Pursis*, or thread their way along by the still more straitened *Kramts* that clung on to the old church walls. So far as picturesque effect is concerned our city reformers seem to have fancied that every bit of the old church which the Lucken booths concealed was to disclose features as rich as the fine Gothic crown they saw towering over the chimney-tops." The part of the street between the Parliament House and the church was a favourite haunt of the citizens in the eighteenth century, and still a large proportion of the inhabitants will be found in the streets of Edinburgh seemingly unemployed.

St. Giles's Cathedral or collegiate church lost some of its true character by the changes which were necessary in order to make the building adapted to variations of ritual. "Mediævalists and Reformers, Presbyterians and Episcopalians alternately struggled for the mastery, and in turn re-adapted the ancient church to their divers modes of worship." But in 1829 William Burn, the architect, must also be credited with a share in the transformations, which seemed to have for end the removal of all that was characteristic and the substitution of the commonplace. The recent restoration obtains the approval of Sir Daniel Wilson, and the church is now as far as is possible brought back to its original condition.

Elsewhere there are High Streets, but we believe Edinburgh alone has a Canongate. The name suggests ideas with which the street does not correspond. It was never entirely made over to canons or monks. As it leads to Holyrood, it must have been favoured by courtiers, and several of the houses preserve traces of their ancient appearance. Cromwell, on his first visit, resided in the Canongate, and the street is associated with men that were notabilities in Scotland. But plebeians, however able in art, science and literature, were obliged to live elsewhere, unless they were compelled through debt to take up their residence in the part known as the Sanctuary, which was secure against bailiffs. The English Opium-eater was one of the last who found refuge there, and Scott appeared to think that, as chronicler of the Canongate, there would be some fitness if the place preserved him from his creditors.

We should have liked to accompany Sir Daniel Wilson in his peregrinations through other parts of the city as well as to the interesting town of Leith, which, it is to be hoped, may always preserve some of its independence. But the pleasure must be sacrificed to expediency. Edinburgh is one of the most interesting of cities, and it would be hard to find a safer and more earnest guide to "the things of fame" that give it renown than Sir D. Wilson. His book is a series of historical pictures that are full of life, with architectural backgrounds which are worthy of the figures.

THE SOCIETY OF ARCHITECTS.

At the meeting of the Society of Architects held at St. James's Hall, Piccadilly, on Wednesday evening, the president, Mr. W. H. Seth-Smith, F.S.I., delivered his inaugural address as follows:—

On the occasion when, following immemorial custom, you look for some utterance, however brief, from him whom your kind suffrage has called to preside over your affairs, it would be disappointing if I could not preface my remarks with a word of congratulation. It seems to me that your Society is stronger than it was at the commencement of last session. The average quality of the papers read was far better than in any other previous year, the meetings were better attended, while there has been no diminution in numbers applying for membership, and the elections have been well sustained, notwithstanding the vigilant efforts of the Council to exclude all who are not *bonâ-fide* and well-qualified architects. The excursion to Belgium was in every sense a successful enterprise—full of profit to us as architects.

But besides the usual work such a Society as ours performs for the mutual advantage of its own members, the Society of Architects has devoted its energies to the interests of the entire profession and to those of the community at large in promoting the registration movement. This is the great idea inspiring us at the present time, an idea which when realised will, we believe, not merely reform, but give an immense impetus to the art of architecture; and if all other reasons were lacking, this is alone a sufficient one for your existence as a Society, and for the sympathy, support and adhesion of all architects who agree that such a measure is necessary.

It is a happy coincidence that at the very commencement of our session I am able to announce that, after years of animated and occasionally acrimonious discussion, the architects of the great colony of Victoria have agreed that it is necessary in future to prevent any but properly-trained men from styling themselves architects, and have drafted a Bill which, presented—as it is to be—to the Legislative Assembly with the unanimous support of the colonial profession, is, I presume, pretty sure to become law within the next year. By comparing the text of the Bill with the Bill which our own Registration Act committee drew up with so much care, and which is still before the Imperial Parliament, you will notice that its provisions very closely follow those of the English measure.

But this is not in my opinion the greatest encouragement we have received of late. I suppose all architects will admit Professor Aitchison to be a good professional authority on such a subject, as being at once an artist and a man of science. In a recent communication to the Architectural Association, which I regard as the profoundest and most comprehensive statement of our wants the profession has yet received from one man in so few words, Professor Aitchison writes thus:—

"Traditional architecture may be said to have come to an end in England when the staircase at Christ Church, Oxford, was done nearly 300 years ago, and since then the profession has been groping in the dark, not knowing what to do nor what studies to undertake, so all past architecture from Greek times has in turn been tried. This is, perhaps, not surprising if we consider that, at the time of the Renaissance in Italy, architecture fell into the hands of scholars, goldsmiths, painters and sculptors, who did a good deal to render its surface interesting and beautiful by proportion, composition, sculpture and painting, and who meant to make Roman work the foundation of a new style, but, not being constructors, they were without the foundation for improvement in a structural art and could have no sentiment of structural functions. Wren alone was a great constructive genius, and if there had been a long succession of Wrens something might have come out of it. It is only by putting architecture again on a constructive basis that we can hope to succeed. All that architects can do must be done by building, and building consists in putting the materials we have at command in certain positions and giving them certain forms.

The size and shapes of these forms depend on statical considerations. Arithmetic, mathematics and geometry can alone enable us to solve the necessary statical problems; so these elements must be first mastered and then the statical problems themselves must be solved. Next comes the knowledge of the strengths and capabilities of the materials we have to use. Then comes planning. The mere physical necessity must be met in the plan, including provisions for the superstructure. If all this is properly done, we have a complete structure fitted for its material wants, but scarcely an architectural one. This structure raises no emotions; it merely satisfies the intelligence that what was wanted has been done."

Professor Aitchison then proceeds to the decorative side of architecture, tracing in a few masterly sentences the causes of success in the past and the pitfalls to be avoided by students of design. He says:—"All the architect can do after the plan or general scheme is settled is to shape, to mould, and to piece the various parts, and he may call in the sculptor and the painter to enrich important parts with carving and colour . . . what we want is easily said: daring construction, fitness for the purpose both material and mental, and mostly with the necessary dignity, simplicity and grace; but to do this requires extraordinary ability, the hardest study of many dissimilar subjects and ceaseless effort."

We who have had some experience of practice know how weighty and true these words are, and therefore protest against the assumption of the title of architect by any persons who have not devoted years of arduous study to the subject.

These words about the disastrous result of architecture falling into the hands of scholars, goldsmiths, painters and sculptors in the Italian Renaissance period are in curious contrast to the petition sent to the Royal Institute of British Architects last spring from about fifty architects and published in the *Times*, protesting against all examinations, even such as their own body, the Institute, has established, which is designed to be no more than a test of a qualifying education.

Surely the dual nature (scientific and artistic) of architecture constitutes it the most godlike of the arts. Can we imagine that the joy experienced by the Architect of Nature is confined to the beautiful forms and colours with which He has dressed physical creation? And no architect can ever feel the highest delight which his art is capable of affording until he has designed and created on the same eternal principles. These exalted emotions must have been experienced by such men as Wren and Telford among Englishmen, and by others who in the various epochs and under different circumstances have led what Professor Roger Smith has termed "New Departures."

In a paper contributed to the transactions of the recent Congress of Hygiene I have endeavoured to show, I hope with some success, that it is perfectly easy to test in a qualifying degree the taste and designing power (as well as the constructional knowledge) of candidates for our calling: and after an animated discussion the Congress passed the following resolution by a large majority:—

"That this meeting cordially approves of the principle of the statutory examination and registration of architects."

Such a resolution may be taken as indicative of the feeling of the public in our favour, and should be a further stimulus to future effort in this cause.

The rapidity with which this movement has, wherever understood, grown and found favour throughout the profession in Great Britain is surprising—I say where understood with emphasis, for I have met and talked with many architects who were at first bitterly opposed to the idea, but have in no single case failed, after a short conversation, to obtain an admission that the arguments in its favour outweighed the apparent objections, or that they had totally mistaken the principle of the proposed measure: the opposition is not to be wondered at considering how some persons and some sections of the press have gone out of their way to misrepresent our aims and statements.

Let me point out one or two leading misconceptions with regard to registration. I will first meet the objection that any universal qualifying examination will exclude many of the very best artists from practising architectural work, as by the peculiar constitution of the artist-mind they are impatient of acquiring even the little science required to qualify for practice. Well let us, for the sake of argument, assume that such men would not come up to the scientific qualification, and would be prevented by an Act of Parliament from calling themselves "architects;" there is nothing to prevent their adopting a title distinguishing them as devotees of the artistic side only of our work, say "architectural artist" or "artist architects," and in art circles they might secure a good practice, and still more often they would be sought as partners by registered men less gifted with a soul for art, but enjoying a lucrative practice, on account of their constructional and business qualifications; but bear in mind we do not seek to prevent on the one side great artists, or on the other charlatans, from being employed, if the public choose to employ them, to do our proper work: all we aim at is to put a stop to the desecration of the title "architect" by its free use on the brass plates of men who have had no training in so difficult a craft, and one moreover in the practise of which the health and pockets of the public are much at our mercy.

Another point to be kept in the foreground is, that we aim only to secure a qualifying and not a competitive examination. The latter would be as fatal to our art as the former would be beneficial.

Another fallacy must be noticed, namely, that men qualified and practising at the time of the passing of any such Act would have to pass an examination. Such a stipulation would be unjust and impracticable. Every practitioner who can give reasonable evidence that he has enjoyed a *bonâ-fide* architectural practice would be entitled to registration, while the affidavit to be signed by each applicant for registration, affirming under penalty that he has enjoyed a *bonâ-fide* practice, will at the passing of the Act exclude men who have no right to be included in the profession.

Not that much progress in the training of architects is not being made: the past year has been a memorable one in this respect. The Architectural Association, which has always been the best friend of the architectural student, and to which in the past many men now well known and greatly esteemed in the profession have devoted much valuable time, has, true to its genius, just established a comprehensive and methodical course of training both in the lecture-room and studio, and has changed its system of gratuitous teaching for a paid staff. I hope that many members of the Society of Architects will give some practical expression of what cannot but be the universal admiration of the pluck and energy of the Association. It still wants 1,000*l.* to relieve its committee of anxiety as regards the expenses of this the new scheme, and, as practising architects, we can do much for it by encouraging our pupils and assistants to attend the classes.

In the International Congress of Hygiene and Demography this summer, many valuable papers by the best authorities, both home and foreign, were read on subjects in which architecture and sanitary science must ever go hand in hand, and those of us whom circumstances unfortunately prevented from attending the meetings will have derived much profit from the perusal of the press reports.

As individuals, I hope it will be our first aim to assist one another in improving our designing power. I cannot say that to this end I wish more members had joined our Belgium excursion, for a party of forty is quite large enough for practical purposes; but one can scarcely exaggerate the influence for good upon our taste which a tour among such art treasures exercises; we shall carry the inspirations there received to our own districts throughout England.

One conviction has been much impressed on me by that tour, namely, the importance of greater uniformity in style, if we are to make our cities, towns and villages effective architecturally. Bruges, for instance, is so impressive because its style and materials are distinctive and sufficiently uniform. It is neither a museum of architectural styles, like Venice, nor is it monotonous like Brussels or Paris; there is endless variety both of outline and detail without the sacrifice of that essential breadth and harmony indicative of unity of purpose; this is what we must strive to set right among ourselves and advocate upon every possible occasion. We are, as a nation, too cosmopolitan and too eclectic to warrant the expectation of seeing some consistency of feeling prevailing throughout an entire city, but the revival of municipal authority and the creation of the County Council of London gives an opportunity, never before enjoyed, of effecting a great reform by laying down a rule that each newly-made street shall be built in this spirit to the approval of the superintending architect, assisted perhaps by a committee of experts. The happy result such a regulation would have can be judged by a visit to Norfolk Street, Strand, and Brook Street, Grosvenor Square; while we may take Shaftesbury and Northumberland Avenues as instances of the disastrous effect of the absence of a sufficiently stringent regulation in this direction.

With respect to the incorporation proposals, or in other words, an application to the Board of Trade to register our Society as a limited liability company, without the word limited being attached to the title, I have to mention that the Council have received through the Board of Trade copies of statements from the Royal Institute of British Architects and its allied societies in the provinces, as well as from the Architectural Association, begging that our application may be refused.

It is obvious on the face of all these documents that both our object in applying for such a license, and the privileges which it is in the power of the Board of Trade to grant, have been entirely misunderstood, but we are glad of the opportunity these petitions afford us of making certain official statements as to the position, aims and prospects of the Society of Architects, which we hope will for ever put to silence the ignorant and unfounded statements which have been circulated regarding us.

In conclusion, allow me to beg each member to strive to

contribute something to the common stock of information, which the experience of every man must enable him to offer to his society. Many might do this by attending the ordinary meetings and taking part in the discussions.

Gentlemen, I wish you a prosperous, profitable and enjoyable session.

THE SUPPLEMENTARY CHARTER OF THE ROYAL SCOTTISH ACADEMY.

OFFICIAL intimation has been received by Mr. John Smart, R.S.A., clerk to the Charter Revision Committee, that the supplementary charter of the Royal Scottish Academy had received the Queen's signature. The new charter, it is understood, finally passed the Privy Council on September 24 last, and was then sent on to the Scottish Secretary's office for the signature of Her Majesty and the counter signature of Lord Lothian. The new charter alters various provisions in the original charter of 1838, with the view mainly of broadening the basis of the Academy and making its management less exclusive. In the preamble the chief alterations are thus summarised:—That the Academy should be authorised to admit a larger number of Associates than are at present admissible; that the Associates should be authorised to share in the election of Academicians and Associates; that certain powers now vested in the Council of the Academy should be vested in the Assembly of Academicians; and that certain powers now vested in the Assembly of Academicians and in the Council should be vested in the General Assembly of the Academy. As at present, the Academy is to consist of three orders or ranks of members, viz. Academicians (thirty in number), Associates and honorary members; and it is ordained that nothing in the charter shall affect the rights or privileges of present Academicians or Associates.

Non-resident Academicians. — It is enacted regarding Academicians elected subsequently to the date of the charter that in the event of their residing out of Scotland for a period of three years they shall forfeit their right and the right of their widows to participate in the Pension Fund. On the expiry of the three years from the date on which any Academician has ceased to reside in Scotland the Academy shall on the day appointed for the election of Academicians supply his place, "so that there may again be thirty Academicians resident and settled in Scotland to secure the proper working and government of the Academy." Such non-resident Academicians, however, retain the right to the title, and to use the words R.S.A. after their names; and if they should return to Scotland within ten years, they are to be re-elected to the participating list on the first vacancy.

Associates.—As respects Associates, twenty only of that rank, in the order of seniority, shall be entitled from time to time to participate in the Pension Fund, so that twenty Associates only shall be entitled to participate, for themselves or their widows, at any one time; but on the number of Associates participating or entitled to participate in the fund becoming fewer than twenty, then any non-participating Associates shall become entitled, in the order of seniority, to participate in the fund. The same provision as to absenteeism in Academicians is also made applicable to Associates.

Government of the Academy.—The government and administration of the affairs of the Academy are to be vested henceforth in general assemblies of the Academy (consisting of the Academicians and Associates), in assemblies of the Academicians and in a council. There shall also be appointed annually, as at present, a president, a secretary, a treasurer, a librarian and two auditors, who shall all be of the rank of Academicians. The mode of electing Academicians shall now be as follows:—At the stated assembly of Academicians, held on the second Wednesday of January in each year, each Academician is entitled to nominate for election as an Academician an Associate or Associates. The list of such nominees shall within seven days thereafter be sent to each Academician and Associate, and the election will be proceeded with at the general assembly on Wednesday, February 2. In regard to the election of Associates, the election will proceed after nomination, and not by application as at present. The Academicians at the stated assembly to be held on the first Wednesday of March in each year shall determine the number, if any, of artists who may be elected to Associate rank in that year. Then at the general assembly of the Academy, to be held on the third Wednesday of March, each Academician and Associate may nominate one or more artists for Associate rank from among those who have exhibited in an annual exhibition of the Academy. Then, fourteen days after this meeting, another general assembly shall be held, at which the election of Associates up to the number previously determined by the assembly of Academicians at the meeting on the first Wednesday in March shall take place. [In regard to the election of an Associate, which should have taken place on the 11th of this month, in room of the late Mr. Keeley Halswelle, that will now be superseded by the new rule already quoted. The next election of Associates will take place under the new charter next March.]

Pensions and other Funds.—It is ordained that the interest of the accumulated funds of the Academy, amounting to 22,512*l.*, shall be applied hereafter in payment of such pensions as the Academy may from time to time appoint, and that the interest of a separate sum of 3,409*l.* shall be devoted in payment of pensions so long as they shall deem it proper to do so. It is directed that all other available funds of the Academy, after payment of all the annual charges and expenses, shall be applied for the promotion and encouragement of the Fine Arts, and for instruction and advancement of students therein, and for increased efficiency of the schools of the Academy, or in lectures on painting, sculpture and architecture, and for salaries to teachers and others and prizes or other awards of distinction to deserving students, or in aiding such deserving students in the prosecution of their studies, or in granting aid in cases of necessity to Academicians, Associates and other artists, or to their widows or others dependent on them, and, so far as may be deemed fit, in the purchase or erection of requisite buildings, as hereinafter provided, or in the purchase of paintings, sculptures, engravings, models or other works of art, or of suitable books for the library or in such other manner as the Academy, in its assembly of Academicians, may from time to time direct as being most suitable for these purposes, until they shall be efficiently carried out, and the remainder of the annual income shall be applied in such other manner for the purposes of the Academy as the assembly of Academicians may from time to time direct.

The Annual Exhibition.—It is stipulated that there shall be an annual exhibition of paintings, sculptures and designs held in Edinburgh, in which "all artists of distinguished merit, wherever they may be resident, may be permitted to exhibit." It is to be opened in the month of February, or such other month as may be arranged, and is to continue open for at least six weeks. "Any member," the charter goes on to say, "who shall fail to contribute of his work to the annual exhibition for two consecutive years shall forfeit all claims upon the Academy or its funds unless he shall furnish, through the Council, satisfactory proof to an assembly of Academicians that the failure was occasioned by illness or other cause which such assembly shall consider a reasonable excuse."

Schools of the Academy.—The schools of the Academy, it is declared, shall be maintained and carried on in accordance with the charter and rules; and in the event of its being considered advisable that the Academy should acquire, either by purchase or on lease, or by the erection of the same, premises suitable for their schools or for any other purpose of the Academy, it is appointed that in such a case a portion of the annual income or of the general funds may be applied for such purposes, and, if necessary, that money may be borrowed therefor, or for any other purposes of the Academy, provided that a resolution to that effect is agreed upon by a majority of not less than two-thirds of the members present at an assembly of Academicians specially called, and confirmed by a similar majority at a second meeting of Academicians to be held within a month afterwards.

In certain rules made under the new charter it is laid down that Associates are to participate with Academicians in the election of the hanging committee of the exhibition, which, however, is to consist of Academicians only; and that in the case of architects they may be nominated as Associates, although they have not previously exhibited at exhibitions of the Academy.

TESSERÆ.

The Arts as Factors in Civilisation.

THE fine arts may be reckoned up in the following order—architecture, sculpture, painting, decoration and design, dancing and bodily demeanour, dramatic representations, music, song, eloquence, poetry, refined speech and demeanour. They may produce the different effects of sublimity, beauty, the picturesque and the ludicrous, and there is associated with these admiration of skill and the pleasure resulting from the imitation of an original by a totally different medium. Beauty must, however, be the prevailing character of art, even when it is not the primary intention: fine harmonies of combination being essential in constituting any great production, and harmony and like-unlikeness wherever occurring are beautiful. Science has only one line of real progress. Art, on the other hand, can progress in many different lines, so as to be open to discussion and control by criticism. *Laissez-faire* does not apply to it. It has not unfrequently disturbed the moral order of society, and run many an individual career to wreck. For example, poetry, whether in the ancient epic and drama, or in the modern romance, or in the thousand ways that it has beautified and bodied forth nature and life, has always taken the start of experience and sober reason in forming men's ideas of the

world; and being so often untrue, it has been the means of causing many bitter disappointments and unavailing regrets. Among the different ways, therefore, in which poetry ought to improve, is that of being truer to fact, discarding such fictions as the happiness of childhood, rural innocence, virtue its own reward, as well as purging out the super-sentimental, the horrible, the obscene, the vulgar and the obsolete. The arts are sometimes at a stand, as when the life of a people has little æsthetic physiognomy, and when subjects can only be got from the past. Our own age wants romantic and enthusiastic fervours, but has nevertheless much that the artist can use. The absence of community of powerful sentiment is the death of song, but the life of the prose poem or novel. Perhaps the most barren region at the present time is the drama. Our mechanical improvements have done a vast deal for art, especially for the diffusion of pictures and designs, as well as in the fabrication of musical instruments. It is pleasant to reflect how humanity has advanced in the practice of removing out of habitual sight and contact the directly offensive, and substituting everywhere, along with the convenient and the useful, the beautiful and impressive in art; and how to a great extent we can now enrich the stream of life with emotions of every variety without sacrificing its pressing objects.

Churches of the Chichester District.

The lover of church architecture who takes it in hand to make the tour of the neighbourhood of Chichester can scarcely be said to be repaid by any great degree of beauty or variety in the churches within easy reach of that city. He runs some risk of being wearied with the eternal recurrence of the simple and somewhat prim First-Pointed type-mould, in which the village church of these parts is almost invariably cast. Lancet windows—faultless, it is true—well-pointed, well-proportioned, well-splayed, deeply set, boldly architraved, but a world too numerous, regular and unvarying, except where beautifully and richly relieved, as at Appledram and All Saints, Chichester and Bosham, with the "dark brilliance" of polished shafts of Purbeck or Petworth; spires somewhat of the shortest and dingiest; aisles but seldom, and those but narrow and penthouse-like, as at Donnington and the Lavants: these are the features which are repeated with little variation in all directions. And one great want will press itself on his attention, viz. the almost total absence of Middle-Pointed specimens of architecture. In vain will he look for the easy flow of tracery, the light and shadow of the bold and well-contrasted moulding, the sharp triangular canopy, keenly cutting through and by contrast setting off the exquisitely-enriched ogee projecting from it, the faultlessly-proportioned chancel, or chantry or porch, and all those other features of the perfect Gothic which are to the genuine ecclesiologist a feast and an enchantment, to the thoughtful symbolist "counsels of perfection." And he will naturally ask how it was that the golden age of sacred architecture never visited these parts, never laid upon these churches that plastic finger of which it may truly be said, "nihil tetigit quod non ornavit"? a question more easily asked than answered. It is not meant to be asserted that there is positively not a trace of the work of this period in the neighbourhood, some honourable though peculiar exceptions being recognised as they deserve; but the state of things generally is such as has been described.

The Parthenon.

Parthenon means the apartment or room of a young unmarried woman. The Parthenônes were those rooms of a Greek house occupied by the young ladies of the family. Each such room was a parthenon. The term is never used in the singular to designate the *suite* of rooms occupied by young women. A parthenon, therefore, was always a portion of a house, never a whole house. To have called any whole building a parthenon would have been exactly equivalent to calling a whole palace a boudoir. We should expect, therefore, to find that the term Parthenon designated, not the whole of the Temple of Athênâ, but only a portion of it—the more retired and private portion. And this we really find was the case. In the numerous more or less fragmentary inventories of the sacred stores of the temple that have come to light, the term Parthenon, though occurring frequently, is never once employed to mean the whole temple. These inventories divide the temple into three parts, naming them in this order—Parthenon, Hekatompedos, Pronaos. It seems as if there ought not to be much difficulty in identifying these divisions. What the Pronaos is is perfectly clear. The Hekatompedos, or Hekatompedosneos (temple of a hundred feet), as it was frequently called, can be nothing but the main part of the building, the temple proper. Nothing, therefore, remains for the Parthenon but the chamber immediately behind the temple proper, or else the posticum. This perfectly plain and simple deduction would, without doubt, have been made and accepted by every student of the Parthenon, but for a childish assumption made unconsciously, viz. that the Parthenos must have stood in the Parthenon. A direct conclusion from this, of course, was that, since the Parthenos must have stood in the temple or main part of the building; this, or at least part of it, must have been the Parthenon. This result has introduced inextricable confusion into the whole question, and, indeed, is at variance with the most obvious facts. The Hekatompedos was a hundred feet long, and that is just the length of the entire neos, or temple. Hence there was no room for the Parthenon there, unless it was a part of the Hekatompedos. And this, indeed, nearly all the archæologists at present assume. But this is plainly at variance with the fact that in the inventories the Parthenon is as plainly distinguished from the Hekatompedos as the Pronaos is, and is always mentioned before both. In enumerating the works of art, say the tombs, in St. Peter's, no one would think of making two such divisions as—1, choir; 2, interior of basilica. It is, therefore, pure folly to imagine that the Parthenon was part of the Hekatompedos. Moreover, the only ground that existed for such a supposition has recently been removed by Dr. Köhler, who has shown, from inscriptional evidence, that the Parthenos stood in the Hekatompedos, and not in the Parthenon at all.

German Sculpture.

The German artists do not, generally, follow the ancient traditions with the same persistence as some other schools. With a fine sense of the value of good form they carry an independence of feeling into their design which preserves their art from the reproach of servility. It shows an endeavour to take what may be called a middle course between the ideal or classical and the extreme realistic. It is a means of connecting art with modern feelings and associations without necessarily vulgarising it, as the ultra advocates for the natural style are apt to do; and where it can be done without altogether sacrificing the principle that beauty should be an element of fine art, it has the force of common sense to excuse and even to recommend it. The patriotism and love of fatherland of the Teutonic nations leads them to employ art largely in subjects of national interest, and they strongly feel the importance of representing historical events in a form consistent with the national idea. In doing this, there must always be the antagonism, to which allusion often is made, between the finest sculpture and its requirements, and art that is to be made consistent with modern associations. There is one obvious advantage in making the examples of the best schools of art the groundwork of instruction in design, and that is the influence they exercise in various branches of industry in which good form may enter. It educates the mind and taste and teaches the value of beauty. This is very noticeable in the instance of France, and it is gratifying in examining the various productions of other countries—at Berlin and Dresden especially—to observe the marked effect of these studies in the elegance of some of the designs and the beauty occasionally seen in details.

The Bourbons and Archæological Remains.

It would have naturally been thought that the Restoration would have made it a special care to restore and preserve the monuments of the past, but it is a remarkable fact that this epoch was the commencement of a system of almost limitless destruction of the edifices which the Revolution had spared, and that the change of dynasty in 1830 has certainly been productive of benefit in this respect at least. In the time of Napoleon the Minister of the Interior, by his circular of June 4, 1810, proposed a long series of interrogatories to all the prefects relative to the actual condition of the old castles and abbeys in their respective Departments. These documents are replete with curious and interesting facts. Under the Restoration M. Simeon, when Minister of the Interior, adopted a similar measure, but it does not appear that any practical results were obtained. The lamentable system of indifference which prevailed on this subject up to 1830 may be inferred from the terms of that ordinance which can never be sufficiently regretted, by which the splendid depôt of historical monuments formed at the Petits Augustins was destroyed and dispersed under the pretext of making restitution to owners who no longer survived, or who did not know what use to make of the objects so restored to them. It is believed that not one of the monuments given back to individual owners has been preserved; and, notwithstanding the notorious difficulty of disposing of these splendid relics, a steady refusal was constantly returned to the reiterated requests of M. Lenoir, the founder of this unique museum, to re-establish his collection with what remained after restitution had been made to every known proprietor. This contempt for and unpardonable neglect of antiquity in a Government whose chief claim to respect was derived from the principle of antiquity extended even to the Conservatoire de Musique; the curious collection of ancient instruments of music which had been formed there was ordered to be dispersed or sold at a low price. This ruinous system, which prevailed in Paris, was practised on a still more extensive scale in the provinces. It would scarcely be believed that, under a moral and religious government, the Corporation of Angers, which had for its chief a deputy of the extremest ultra-loyal opinions, should have been allowed to convert the Gothic church of St. Peter into a theatre.

It is still more incredible, but not the less true, that the church of St. Cesaire at Arles, which the most erudite antiquaries looked upon as one of the oldest in France, was transformed *en mauvais lieu*, without any public functionary protesting against such profanation. Who would think that no effort was made, when the Most Christian King returned to the throne of his fathers, to rescue the magnificent papal palace at Avignon from its military desecration? And who could credit the fact that at Clairvaux, in that celebrated sanctuary which was directly connected with the authority of the State, the exquisite church, so beautiful in its proportions and so complete in its grandeur, which dated from the twelfth century, and was said to equal Notre Dame at Paris in size, which was begun by St. Bernard, where so many queens, princes and pious generations of monks were entombed, and where the heart of Isabella, the daughter of St. Louis, was deposited, that this edifice, which had survived the havoc of the Revolution and the indifference of the Empire, should have been demolished in the very first year of the Bourbon restoration? It was then razed to the ground, with all its projecting chapels, without leaving one stone upon another, or even sparing St. Bernard's tomb, to make room for a square surrounded by trees in the centre of the prison which occupied the site of the venerable monastery. Before leaving Clairvaux, we may as well mention that a prefect of the department of Aube, under the Restoration, actually sold seven hundred pounds weight of the archives of this famous religious house, and which were removed to Troyes; and the Count de Montalembert stated that, when he was at that place, he walked over a heap of parchments strewed thickly on the floor, from which he picked up a bull of Pope Urban IV., the son of a shoemaker of that very city of Troyes, and probably one of its most illustrious children. The same prefect demolished the relics of the palace of the ancient counts of Champagne, of the noble and poetic dynasty of the Thiebauds and Henri-le-Large, because they were in the line of a crescent which his architectural genius had unfortunately devised. The beautiful gate of St. Jacques (constructed in the time of Francis I.) and that of Beffroy suffered the same fate. Another prefect of the Restoration, in the department of Eure and Loire, had no scruple in appropriating to his own use several painted windows of the cathedral of Chartres to decorate the private chapel of his country mansion. It has been incontrovertibly proved that during the fifteen years of the Restoration more irremediable devastations were committed in France than in the period from 1789 to 1813. This destruction was certainly not enjoined by the Government, but it was done under its eyes, with its tolerance, and without exciting the slightest marks of its solicitude.

Sanctuary at Hexham.

St. Wilfrid obtained the right of sanctuary for Hexham; its limits were marked out by crosses. That on the south exists no longer even in tradition; that on the west has left its name to the Maiden Cross Fields; the eastern cross is perfect, and stands in the White Cross Fields; the northern one is mutilated, but still graces the Cross Bank. Richard of Hexham says that the penalty for violating sanctuary within the crosses, but without the town, was two hundreds (16*l.*); within the town, 32*l.*; within the monastery, 48*l.*; within the church, 96*l.*; within the choir, 140*l.*; "but if any one, possessed of the devil, violated the fried-stool, or the altar, he was Botolos, *i.e.* beyond the reach of pardon." This stool is a plain First-Pointed stone stall, with sloping sides, like the Glastonbury chair.

Government Maps.

In all the countries of Europe the necessity has been recognised of having a detailed and accurate map, which should be available for military and administrative purposes. The scales on which these surveys have been published have varied from about 3 inches to a mile to about three miles to an inch. First in point of scale comes Hesse, the map of which is published on a scale of 1 in 25,000 or about 3 inches to a mile. Belgium comes next, 1 in 40,000; then Baden, Bavaria, Sardinia, Holland, Wurtemberg, Oldenburg, Grand Duchy of Hesse, 1 in 50,000; Saxony, 1 in 57,600; Great Britain, 1 in 63,360 (afterwards increased to 1 in 10,560, and again to 1 in 2,500); Denmark, France and part of Prussia, 1 in 80,000; Lombardy, Venetia, States of the Church, Tuscany, Parma, Placentia, Guastilla, 1 in 86,400; Hanover, Portugal, Prussia, Sweden, Switzerland, 1 in 100,000; Schleswig-Holstein, 1 in 120,000; Russia in Europe, 1 in 126,000; Austria, 1 in 144,000; Norway and Greece, 1 in 200,000. These surveys have been mostly executed within the present century, and many of them are still incomplete. The survey of Great Britain commenced by the measurement of a base-line on Hounslow Heath in 1784. The last country in Europe (excepting Turkey) to recognise the necessity of a Government survey was Spain. All these Government surveys have been based on triangulations, conducted, for the most part, on the most elaborate and scientific principles. The ingenuity of mechanicians has been exhausted in planning instruments that shall measure base-lines to the fraction of an inch. Instruments for celestia observations and for measuring angles have been devised by the best astronomers and opticians of the day, and the result has been a marvellous accuracy, of which an idea may be formed from the fact that in the English survey the difference between the length of a base-line seven miles long in the north of Ireland obtained by actual measurement, and that which resulted from triangulation starting from a base in the south of England and carried over the whole of England and Ireland, was only 5 inches. The triangulation of the different countries has been connected together. The last link in the chain was completed in 1861–62 by the connection of the Belgian and English surveys across the north of France and the British Channel. This was effected by simultaneous but independent observations carried on by the French and English engineers.

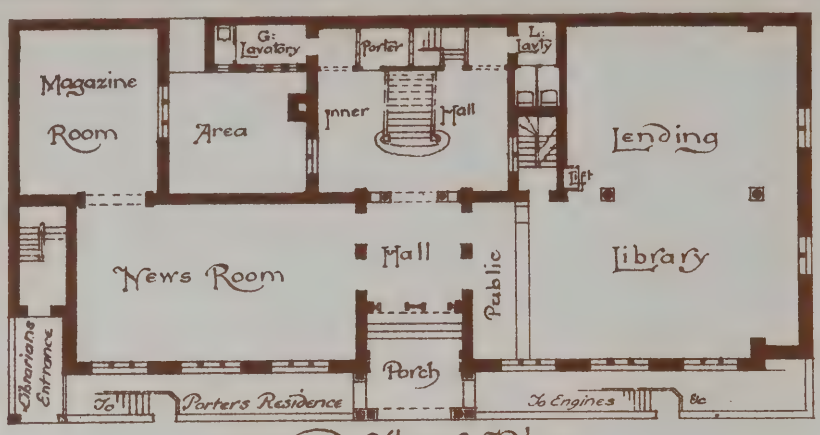
Filigree Ornaments.

Filigree-work that is still an industry at Genoa and Malta is as much at home in Norway and the rest of Scandinavia as it is in the hands of the artisans of India, and it survives in all nearly unchanged from what it was in the days when Greek, Etruscan, nay, Phœnician goldsmiths were busy in producing filigree on the shores of the Mediterranean. It is said that even that delicate and most sensitive instrument of touch, the hand of the Hindoo, is not sufficiently sensitive for fashioning the finest sorts of Indian filigree, and that children alone are employed in the manipulation of such a spider-web of wire. It is to be remarked of this elegant and primitive, perhaps very earliest, form of ornament in precious metal that it had probably reached its limits for delicacy and design at a very archaic period, and has made no real progress in recent times; that, in fact, the early Greek filigrainer worked with as much facility and delicacy as the Hindoo artisan of our day, who inherits the skill and the methods he uses by the direct descent of an immemorial tradition. But there are other forms of the goldsmith's art scarcely less venerable than that of the filigrainer possessed of great native beauty, and which also have survived in India, through the long roll of centuries, as the Zend or Sanscrit languages have survived there, the inheritance of families or clans. These forms of art are perishing. One by one, as the family in whom it may have been handed down becomes extinct or lets the thread be broken, each of these hereditary industries of India moves on with time to its extinction.

Timber in Damp Places.

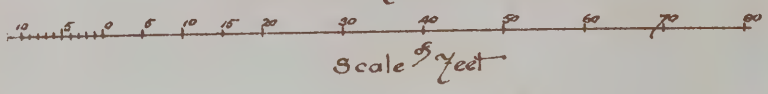
The surface of all timber exposed to alternations of wetness and dryness gradually wastes away, becoming dark-coloured or black. This is really a slow combustion, but is commonly called wet rot, or simply rot. Other conditions being the same, the most dense and resinous woods longest resist decomposition. Hence the superior durability of the heart-wood—in which the pores have been partly filled with lignine—over the open sap-wood, and of dense oak and lignum-vitæ over light poplar and willow. Hence, too, the longer preservation of the pitch-pine and resinous "jarrah" of the East as compared with non-resinous beech and ash. Density and resinousness excludes water, therefore preservatives should increase those qualities in the timber. Fixed oils fill up the pores and increase the density. Staves from oil barrels and timber from whaling ships are very durable. The essential oils resinify, and furnish an impermeable coating. But pitch or dead oil possesses advantages over all known substances for the protection of wood against changes of humidity. According to Professor Letheby, dead oil, 1st, coagulates albuminous substances; 2nd, absorbs and appropriates the oxygen in the pores, and so protects from eremacausis; 3rd, resinifies in the pores of the wood, and thus shuts out both air and moisture; and, 4th, acts as a poison to lower forms of animal and vegetable life, and so protects the wood from all parasites. All these properties specially fit it for impregnating timber exposed to alternations of wet and dry states—as, indeed, some of them do—for situations damp and situations constantly wet. Dead oil is distilled from coal-tar, of which it constitutes about ·30, and boils between 390 and 470 degrees Fahr. Its antiseptic quality resides in the creosote it contains. One of the components of the latter, carbolic acid (phenic acid, phenol) C^{12} H^{6} O^{2}, the most powerful antiseptic known, is able at once to arrest the decay of every kind of organic matter. Professor Letheby estimates this acid at ½ to 6 per cent. of the oil. Chrysilic acid C^{14} H^{8} O^{2}, the homologue of carbolic acid and the other component of creosote, is not known to possess preservative properties. While an external application of coal-tar promotes the preservation of dry timber, nothing can more rapidly hasten decay than such a coating upon the surface of green wood. But this mistake is often made, and dry rot, instead of wet rot, does the work of destruction. Carbonising the surface also increases the durability of dry, but promotes the decay of wet, timber. Farmers very often resort to one of the latter methods for the preservation of their fence-posts. Unless they discriminate between green and seasoned timber these operations will prove injurious.

NOTES AND COMMENTS.



As military service has to be undergone by most of the civilians in France it might be supposed that rigid notions of discipline and loyalty to appointed authorities should prevail throughout the land. In all things relating to art there is, however, an independence which is not to be restrained by any authority that is now to be found. A remarkable case which exemplifies the weakness of authority is troubling the Government, and unless judgment is exercised may lead to the injury, if not to the irreparable decline, of the Gobelins factory. It is not long since M. GALLAND, who is one of the few great masters of the art of decoration, was appointed to be director of the establishment. He was well fitted for the office, and it was supposed that his suggestions would be acted upon readily. But M. GALLAND has discovered that artists resent his interference. Commissions for big pictures to be executed in tapestry are given freely by the Government. Any sort of subject seems of late to be considered as suitable, and therefore it is not necessary for the artists who are favoured to have made a study of decoration. The old canons of art are set aside, and whatever can be presented in colours on canvas is supposed to be able to be reproduced by means of a variety of threads. The advice of an artist of the standing of M. GALLAND, if followed, would prevent many fiascos that now seem to be inevitable, and there would be a chance for the survival of some at least of the traditions of the Gobelins factory. But partly owing to the licence which now finds approval in art, and partly to the contempt for officials in general, M. GALLAND'S counsels have been ignored, and therefore he has sent in his resignation. There was no other course open to a man whose sense of dignity would not allow him to be a salaried nonentity like some other heads of departments. At the same time, what human power can be discovered that is strong enough to make French artists submit to discipline?

THE architects of Rome have imitated their brethren in other parts of the world by forming a society, which will, however, have nothing in common with a trades union. The art of architecture is placed above selfish interests. The first aim of the society will be the more earnest study of the buildings in Rome and Italy which possess historic or artistic interest. It is also intended to have exhibitions of drawings of executed works, and of projects for building. Conferences will be held from time to time for the discussion of subjects relating to æsthetics, archæology and the history of art. Competitions for designs for architecture and the allied arts will also be opened. Some of the members are to form a vigilance committee for the protection of ancient works in Rome and the neighbouring districts. The subscription will be about 1*l.* 10*s.* a year. Amateurs are eligible for admission to the society.



AMERICAN legislators are not yet educated to the degree which is necessary for making a law which will prescribe the possession of a diploma as indispensable for practice, and their ignorance will not soon be dispelled if architects are to be the teachers. When, for instance, a Congressman reads an account of the Convention of Architects which was held a few weeks ago in Chicago, and discovers that the issue of diplomas is not considered to be salutary for the finances of the American Institute, as the members would not be eager to pay subscriptions if they once got hold of those precious documents, he is not likely to be in a hurry to pass Registration Bills. His native shrewdness will reveal to him that what is sought is the upholding of a society, and not the benefit of the community. Private interests are sought to be advanced by making them appear as national questions. The efforts to pass the Bills are, however, to be regretted, for they reveal wasted hours. Mr. CARLIN, of Buffalo, narrated before the Convention the history of three of his attempts to enrich American institutions with a State Board of Architects. He said:—"This Bill was introduced in the early part of the session by a member of one of the districts in Buffalo, and was referred to the Committee on Laws and Legislation. They gave us a hearing, and we went, four of us I think, before the Committee, and we succeeded in getting—an almost unheard-of thing—in getting the Bill reported favourably out of the Committee on the first session. The Committee at the session at which we had the hearing reported the Bill favourably. And there is an unexplained reason why that Bill never turned up. It was finally called out and a vote taken, but the ayes and nays were never called on it, and it was killed in the Assembly, apparently through a lack of interest or for some reason. There was an effort made, which I am sorry to say failed, to get the National Association of Builders, in session in New York in February, to formally endorse the Bill and pray the Legislature of the State for its passage. But the builders took a very conservative view of it, and said that the architects never did anything for them, and they didn't feel like doing anything to help them out; and the resolution which was offered endorsing the Bill and asking the Legislature to assist in its passage was lost. We covered that fact up as far as possible, and did not make any great parade of it. Still, I do not think it had any adverse effect on the passage of the Bill." Now, if the builders were sufferers through the alleged incompetency of vast numbers of men calling themselves architects, would they have shown so much indifference when they saw the architects prostrated before them? It may be said that they gain by incompetency, but it should be also borne in mind that in America builders have risks when there are defective designs, and their interests are therefore bound up with the education of architects. But, like the Congressmen, they know that proficiency in construction is not to be obtained through cramming for examination and the payment of fifteen dollars for a license. Besides, the builders could read the acknowledgment of the promoters "that it is impossible to compel every man to employ an architect to design a building, that he could design it for himself, or employ any person whom he saw fit to design it for him, if he did so with the full knowledge that the person so employed did not claim or profess to be a regular recognised practising architect."

HOT-AIR baths are not as modern in England and Ireland as is commonly supposed. The lines which HERRICK addressed to PEMBERTON suggest that in the seventeenth century "a sweating closet" was not unknown in English houses. In Ireland baths of the kind were used long before URQUHART persuaded Dr. BARTER to introduce a Turkish institution. Lately one was discovered in the island of Rathlin, which, schoolboys know, appears on the map as the most northern part of Ireland. This Tyfalluis, or sweating-house, has been in use from a time that is beyond the memory of the oldest islanders. The bather sat on a stool which was placed on a stove, the place being first heated by peat turf. Unlike modern baths, the heat could be regulated at will, for there was an aperture at the top covered with a flag which could be moved aside. Besides, the dry masonry of Ireland obviates stuffiness. The doorway was about 3 feet in height. Remains of two additional baths are to be found on the island. They were used especially after operations in the bogs or handling flax. Although the baths were small, four bathers could be accommodated in each of them. Another sort of bath employed in Ireland was formed by digging a hole in a field; the patient descended and the clay was packed round him, his head remaining free above the surface of the ground. This was a favourite remedy with the father of HUGH O'NEIL, the last of the Ulster chiefs. Other people preferred to be fixed in a hole in the sand on the sea-shore, and afterwards a reaction was obtained by swimming in the sea.

IT was proposed a couple of years ago to hold an exhibition in connection with the French Union Centrale des Arts Décoratifs, which would exemplify applications of plant form in the art of the past as of the present. The idea was, however, so important it was afterwards decided that it would be a fitting one with which to inaugurate the galleries of the new museum, or to celebrate the opening of the building by such an exhibition in a different place. On the assumption that the French Senate will compensate for the delays of M. ANTONIN PROUST and his allies, it is now said that the exhibition, which will illustrate the employment of plant forms, can be arranged for 1894. As a stop-gap, it is intended to hold an exhibition of the "Arts de la Femme," from August to November in 1892, and it will be both retrospective and international.

DESIGN FOR A LIBRARY.

THE design illustrated was submitted in competition for the Architectural Association Medal, and was drawn up in accordance with certain requirements. The ground and first floors constituted the main part of the library, the top floor furnishing accommodation for the librarian and the basement for the porter. Each floor contained a book-store, and the whole four floors were connected by a separate stair for the library officials and attendants. There were also separate entrances and staircases for the residences. The external walls were intended for stone or terra-cotta, the roof for permanent green slates, the railing of wrought-iron, and the base of piers at entrance were to be granite. The drawing from which the plate was taken was exhibited this year in the Royal Academy.

CHURCH OF ST. MARY THE VIRGIN, EAST GRINSTEAD.

THIS church, which is being built in sections, is to be of brick, with red facings externally and internally, the nave arcading, internal lining of chancel, window and door dressings being of local stone from the Honeywell quarries. The church, when completed, is intended to seat 500. The first contract, which is now being carried out by Mr. F. STEVENS, contractor, of East Grinstead (the cost of which is being entirely defrayed by the family of the late Mrs. STENNING, of East Grinstead), includes chancel, vestries and one bay of nave. This will necessitate a wooden building to accommodate the worshippers until such time that sufficient funds may enable the building to be completed. In the chancel, which will simply be divided from the nave by a low dwarf wall and wrought-iron screen, there is a very prettily-designed sedilia and piscina. All the woodwork in doors, choir-stalls and screens will be of wainscot oak, the floor throughout being wood-blocks. The lighting is being carried out by Messrs. JONES & WILLIS. The architect, Mr. W. T. LOWDELL, of 19 John Street, Bedford Row, London, estimates the total cost of the building to be about 5,000*l.*

THE PRIORY, CARTMEL.

COPYRIGHT IN PICTURES.

A CASE of great importance to painters and owners of pictures came before Lord Coleridge and Mr. Justice Wright on Monday. In it the question was raised whether, under the Copyright Act, 1862, there is an appeal from an order of a judge that an entry of copyright in a picture or other work of art shall be struck out or erased. The question had arisen under the following circumstances:—According to his affidavit Mr. Herbert Schmalz, the artist, was the author of a painting entitled *The Young Duchess*, which was exhibited at the Royal Academy in 1890. He sold the original painting to a private purchaser, the copyright in the picture being expressly reserved to him. In October 1889 it was decided to publish an engraving of the picture, and he received from Mr. Cadbury Jones, a partner in the firm of Millard & Co., a letter, which, he said, only referred to the right of reproducing the picture as a mezzotint engraving. In February 1890 the letter was repeated in a formal letter of the firm, which also only referred to the engraving of the picture and to copies thereof sold and all rights in connection therewith; and the plate for the engraving was to be prepared at the expense of Mr. Jones or his firm; and Mr. Schmalz, he said, "was to be at no expense in connection therewith." In September 1890 no steps having been taken by Mr. Jones or his firm to proceed with the engraving, the arrangement, as Mr. Schmalz said, was abandoned by mutual consent and was superseded by an agreement in writing in two letters between the artist and Mr. Jones (produced), which referred only to the right of reproducing the publication in the form of an engraving; and Mr. Schmalz was to have the plate prepared at his own expense, and the publication became a joint adventure. In pursuance of the agreement, he caused to be engraved, at an expense exceeding 150*l.*, a plate of the picture, which was ready for printing in May last. The firm, however, in that month was dissolved by a decree in Chancery, and Mr. Schmalz was informed by Mr. C. A. Millard that the publication of the engraving would have to remain in abeyance, and as no steps were taken for the publication, and Jones and the firm were unable to carry out their arrangement, he, on July 18, 1891, wrote to Mr. Jones cancelling the agreement. It appeared that Mr. Jones and Mr. Millard were now disputing as to the right of publication, and that the Chief Clerk in the Chancery proceedings had declined to include the copyright in the assets of the firm. Mr. Schmalz had since ascertained that in March 1890 the copyright of the picture was registered at Stationers' Hall as the property of Millard & Co., and that this was totally unauthorised by him, as the agreement had been cancelled, the effect of which was, as Mr. Schmalz complained, to prejudice him seriously and prevent his making any arrangement with other publishers for the publication of the picture. In answer to this statement of the facts, Mr. Millard made an affidavit that there was an actual assignment of the copyright by Mr. Schmalz to his firm at the date of February 20, 1890, and that he had never consented to the alleged arrangement; that the partnership was dissolved by decree in April 1891, and that any letter of Jones of July must have been private and contrary to good faith as a partner; and that any claim of Jones to the copyright was groundless and had been given up, and that the alleged agreement of September 1890 was a private agreement between Mr. Jones and Mr. Schmalz, and one which did not bind the firm. Upon these affidavits an application was made on the part of Mr. Schmalz, the artist, to the Vacation Judge, Mr. Justice Collins, to erase the entry of the copyright at Stationers' Hall as on Mr. Millard. The entry was as follows:—Date, March 18, 1890, painting of girl's head and bust, entitled *The Young Duchess* (photograph attached). Date of assignment, February 20, 1890. Names of parties, Herbert Schmalz, Claude Albert Millard & Co. Name of proprietor of copyright, Claude Albert Millard & Co., 57 Charing Cross. Name of author, Herbert Schmalz, Holland Park Road, Kensington. The application was under the original Copyright Act (5 and 6 Vict. c. 43, section 14) applied to pictures by the Art Copyright Act of 1862 (25 and 26 Vict. c. 68). And on hearing the case the learned judge made the order to erase the entry of Mr. Millard's name as proprietor, and this order having been obeyed Mr. Schmalz had got his own name entered as proprietor. Mr. Millard, the publisher, desired to appeal against the order of erasure, but when the case came on the objection was taken that there was no appeal against such an order as that, at all events, if there was any appeal there could be none from an order of the Vacation Judge sitting as a Divisional Court to a Divisional Court, but that it must be to the Court of Appeal, and cases were cited in which it was held that there was no appeal under the original Act (*Ex parte* Davidson, 18 Com. Bench Reports) and Chappell *v.* Purday (12 Meeson and Welsly Reports), and there being no express provision for appeal in the later Act, the Art Copyright Act of 1862. The learned counsel for Mr. Millard (Mr. Ruegg) was not prepared to argue the question, and the case for his client's convenience was postponed, on condition of his client paying the costs of the delay arising from the postponement. The case now came on again, but the appellant, it appeared, had not complied with the condition and did not appear.

Mr. Scrutton appeared for the artist, Mr. Schmalz, and, having stated what had occurred, moved that the appeal should be dismissed with costs.

Lord Coleridge said it must be so, and he and his learned brother, upon the question, which was a very important question, whether there was an appeal or not, were disposed to think that there was no appeal, especially as under the original Act it had been twice decided that there was no appeal, and none was given in terms by the later Act. But, at all events, they thought that there was no appeal from an order of a Vacation Judge to a Divisional Court. However, they must, as the case stood, dismiss the appeal with costs.

ART AND NATURE.

A COURSE of ten weekly lectures on the relation between art and nature has been commenced by Mr. R. A. M. Stevenson in the City Art Gallery, Manchester. Mr. T. Worthington, who presided at the opening lecture, said the Council of the Manchester Institution had hoped to make arrangements for a series of lectures during the previous season, but for reasons it was unnecessary to go into they had not been able to do so. The original purpose of the Institution in its lectures was to take up some subject connected with art rather than to give occasional lectures on various subjects. They had done well, he thought, to come back to their old quarters. The Mayors of Manchester had always very kindly given them

the use of the Mayor's parlour at the Town Hall, but as there was sometimes a doubt as to whether it would be available, it had been thought better that they should come back to the old house. If the present experiment proved a success they looked forward to a repetition of the old lectures given under the auspices of the Institution before the place was taken over by the Corporation. Part of the contract between them and the Corporation was that the Corporation should provide the Institution with a suitable lecture-room; but as the old lecture theatre had been converted into an art gallery they would in the meantime try what could be done with the present room.

Mr. Stevenson, in beginning his lecture, said he was afraid that art was too much talked about. Almost a religion, or, what was more, a superstition, had grown up round the arts; and if art was to be made too much a public virtue, to the exclusion of private enjoyment, it would become as shoddy as most other public virtues. He was not going to place before them so much a system of æsthetics as an attitude of mind. He did not want to make them feel what art was philosophically, but what it was to the people who practised it. The lectures would contain no formal scheme of teaching, but he would attempt to convey a condition of mind induced by twenty years' practice of painting in various schools and by much talk with various artists. The school to which he was himself most addicted was the modern French school, but he would not seek to impose upon them his own particular likings. Indeed, they would do well not to believe all he said to them. His object was to separate the work of the artist from the ordinary work of life, showing wherein they differed. He supposed all men to be gifted with the ordinary human sentiments. The artist he considered as a man who, over and above the possession of these sentiments, had a more keen appreciation than others of the material of some art. The artist, in fact, was a specialist just as a mathematician was a specialist; and as he was dealing with a special material he required a special imagination. Imagination was a separate faculty in each of the arts, and if there was any underlying general faculty beneath the man and the artist and the work of the artist, it was sentiment, not imagination. He rather regarded imagination as a faculty which varied with the varying material of the different arts. He wanted to bring out two faults particularly applicable to English criticism. First, the confusing of sentiment and imagination, which led people to look rather at the title of a picture than at the way it was painted. Secondly, the neglect of the material limitations and conditions of the medium used, leading to the confounding of things suitable to be expressed in words and things suitable to be expressed in form.

WATER-COLOUR PAINTING IN SCOTLAND.

THE annual luncheon of the Royal Scottish Society of Painters in Water-Colours was held in Glasgow last week. Dr. Forbes White proposed "The Royal Scottish Society of Painters in Water-Colours." He was specially glad to be present, he said, because it gave him an opportunity of expressing for himself and others outside the Society, the great indebtedness under which they lay to them for their constant efforts to make life sweet and happy by such exhibitions as the present one. They all knew that the art of water-colour painting was strongly associated with England—in fact, it was held to be an English art exclusively coming from Paul Sandby and Girtin downwards through the great painters to Cox, Prout, and all these great names, and culminating at last in the great Turner. With these the greatest of water-colour paintings was chiefly associated. But it was impossible to confine it to such a narrow sphere. It spread during the last century to France, Spain, and last of all to little Holland, all of which were now giving their energies to the production of water-colour works. Holland—the little country corresponding to our little Scotland—occupied a very prominent position in water-colours at the present time, and let him say in passing, what all the members of the Society would agree with him in, that they had learned with great regret of the recent death of the great Dutchman, Johannes Bosboom, who was so largely identified with interiors, and who touched nothing in water-colours which he did not adorn. But was it to be supposed that Scottish artists should stand aside and take no share in working with the water medium when so many Scottish artists were well known for their skill in oils? Thanks to the organisation of that Society some fourteen years ago, the Scottish artists banded themselves together to form that Society, and had held with marked determination to their original purpose, and he said it was all the more to their credit because they had gone on amid great discouragement—discouragement which would have baffled any people but the patriotic Scots. It unfortunately could not be said that the Society had flourished financially. Their exhibitions, he was sorry to say, had frequently a deficit. This was, alas! too frequently the experience of all such exhibitions in Scotland, but, undeterred by that, they had gone on, and year by year, if their exhibition was not large, it seemed to him to be always getting finer in quality. How was it, he asked, that a city like Glasgow was unable to provide sufficient attendance to make an exhibition of this sort pay? He was inclined charitably to believe that they did not take sufficient means to make the exhibition known, for, if it were known, he could not but believe that Glasgow would come in large bodies to see their exhibition. Glasgow was promoting a great temple for the promotion of music and fine arts. One could only hope there was to be a great resurrection of the minds of the people in regard to art, but they might build a temple as fine as they liked, only unless they stimulated the love of art among the people their labour was in vain. Another very encouraging feature came from the other side of the island—from Edinburgh. He read with extraordinary pleasure in the newspapers the account of the new charter which the Royal Scottish Academy had got. If he read rightly, that was a liberal and comprehensive charter, which would in a great measure solve the difficulty and take away much of the rivalry which existed between the east and the west. It seemed to him to open up a great opportunity before the country of making that Academy—which was to be honoured for its traditions and the work it had done in the past—of giving it the full power of making the ancient Royal Scottish Academy co-equal with the wants of the Scottish nation; and that round the Royal Scottish Academy, like a foster-mother, they would gather, and she would become a centre of light and influence under this new charter, which might really do a great deal towards improving the cultivation of art among the people. He was privileged to see the reply of Mr. George Reid to the Academicians when they sent their message asking him to accept the position of President. It was short, but it was to this effect, that he would accept the position by the act of the Royal Scottish Academy, and he added, "and the benefit of art in Scotland." That struck him at the time as being the keynote which was properly to be sounded by a new President of the coming time, and if he did not mistake Mr. Reid, he would be a man who would in the most generous, large-hearted way carry out the full idea of the new charter in all its comprehensiveness. From that he believed might flow a course of happiness which would give pleasure and benefit to most of Scotland and to all those interested in these high things, and which would certainly stimulate a Society such as the present to carry on its excellent work.

The Chairman, in responding to the toast, said he was sure they would one and all sympathise with the President in the domestic catastrophe which had so suddenly come upon him. On behalf of the Society, he did not wish to blow their trumpets too strongly, but they could point out on these walls around them the immense progress they had made in the last five years. Five years ago there was a great deal of amateur work on the walls. Now, on the contrary, there was none; but there was evidence of the rare skill which their craft displayed in their work. They did not, however, lay the flattering unction to their souls that they were perfect. They were far from that. There were many things which they ought to have done which they had not done; and he asked the members if they had made a sufficiently special study of seizing the fleeting beauties which beset them as landscape painters, and had taken any special pains to depict them? He also reminded them of the value of friendship, because if they knew each other better the spirit of competition would give way to the spirit of honest emulation.

DUNDEE INSTITUTE OF ARCHITECTS.

THE eighth session of the Dundee Institute of Architecture, Science and Art was opened on the 4th inst. Mr. Charles Ower, C.E. (the president), occupied the chair, and stated that it had been customary to open the session with a conversazione, but that function had been postponed till the 18th, on which day it was expected that the Marquis of Lothian, Secretary of State for Scotland, would open the Fine Art Exhibition. Professor Baldwin Brown gave a lecture on the "Growth of Cities." He began with a detailed account of Old Dundee, and explained its topography by the help of a limelight view of the city from the slopes of the Law and a reproduction of Crawford's eighteenth-century plan of the town. Though there were three eminences round the city, the Steeple seemed to have been the citadel from which enemies were kept at bay, the ordnance being fired from the windows at the top of the lofty structure. Professor Brown proceeded to say that there were two kinds of city—the old and the new; the old city which grew up irregularly, just as nature prompted, and the new city, which was laid down according to a regular plan. In Dundee they had no striking contrast between the old and the new city, and perhaps the most notable instances in Britain were to be found in Edinburgh and in Bath. This led the lecturer to speak of the rectangular planning of Edinburgh, and to say that that feature was conspicuous in ancient Greece. Old cities were laid out with a view, not so much to the convenience of the

inhabitants as to the keeping of enemies at a distance. In addition to the rectangular there was the radiating principle of forming cities, branching out from the centre after the manner of spokes from a wheel, and this plan was seen to advantage in Paris. Referring to the Mediæval and Classical (or regular) styles of architecture, he said that, while with the one they secured charm, picturesqueness and variety, with the other they got dignity and stateliness. A large number of views were shown as illustrating the points of the lecture, and, in conclusion, capital pictures of the Dundee Town Hall and the Morgan Hospital were exhibited. In regard to the Town Hall, he remarked that while one might wish to see a grander building, one would, at the same time, desire to retain its massive and substantial appearance. Mr. Mackison expressed the opinion that towns ought to be spread over a larger area than was customary at present, and he did not think it was for the good of any city that the well-to-do people should live at a distance from it, as thereby they removed that influence which otherwise they might exert for the benefit of the community. All classes of society ought to come more in contact with each other. Due regard should also be paid to the advisableness of not planting works injurious to public health in the vicinity of dwelling-houses. Mr. C. C. Maxwell thought that, with so many public-houses, unsanitary dwellings and heavy taxes, it was not surprising that people should try to escape from them. The Chairman proposed a vote of thanks to the lecturer, and Professor Brown, in acknowledging, alluded to the naturally fine situation of Dundee, and said there was scope for the formation of a beautiful city in the west-end district.

A LIVERPOOL SQUABBLE.

AT the last monthly meeting of the Toxteth School Board the subject of the condition of the school was considered. According to the *Liverpool Mercury* the minutes showed that for some little time past correspondence had been proceeding between the Board and Messrs. C. O. Ellison & Son, the architects of the school premises, as to certain variations. The Board, it appeared, had called in Mr. T. Mellard Reade, who, after investigation and examination of the structure, reported in particular as to the basement rooms, which were intended to be used as workshops for the purposes of technical education.—Mr. Thomas read sections of this report. The walls of these rooms, Mr. Thomas stated, were described by Mr. Mellard Reade as very damp and covered with a thick efflorescence. An examination of the ground under the main schoolroom showed that it was filled with stuff, but of what it consisted, further than what could be examined near the surface, which was partly peaty soil or sand, he could not say. In its present condition this room, from damp and want of ventilation, was not fit to be used as a workshop, but Mr. Reade thought it possible to make it fit by covering the walls with a good strong coat of hydraulic cement, concreting the floor, and effectively ventilating it by air-shafts, inlets and other appliances. The cause of the damp was capillary soakage through the walls from the surrounding ground. Mr. Thomas went on to say that this matter had been kept from the public hitherto, but he considered that it was right that the ratepayers should know whatever was in it.—Professor M'Cunn thought that the letter of Messrs. Ellison should be considered by the Sites and Buildings Committee, as they might then go into more detail than was advisable there.—Mr. Edwards said that he was strongly of the same opinion.—Mr. Macandrew said that Messrs. Ellison had emphatically declared that the correspondence was closed, so that no good could come of further letters.—Mr. Thomas said that it was not for Messrs. Ellison to take up such a position as that; it was for the Board to say whether or not more should be said.—In the course of a further discussion on the subject it appeared that Messrs. Ellison had also called in "three of the best-known architects in the city," from whom reports were by them submitted. Messrs. Ellison said that the two variations adopted were entirely beyond the Board's control, and being absolute necessities arising during the execution of the work demanding the most prompt attention and care to prevent accident to men and danger to property, were dealt with by architects "in the usual way," as by architects who knew their duty to clients, and that in the steps taken they had the sanction of the then chairman of the Sites Committee, as set forth in a letter.—Ultimately the Board referred Messrs. Ellison's correspondence to the Sites Committee, and decided to instruct Mr. Mellard Reade to draw up specifications for the execution of the work recommended in his report.

In a letter to the local papers Messrs. Ellison & Son offer the following explanation:—

In order rightly to estimate the real value of the complaints made, the ratepayers should know that the Mr. Thomas who figures so prominently at the Board's meeting, and who is now the chairman of the Works Committee, practises as an architect, and a few months prior to his election on the Board he suffered at our hands a severe defeat in a well-known local competition, since which he has exhibited anything but a friendly feeling towards us, and that may probably account for a good deal of annoyance we have of late experienced in this matter. We notice that after quoting from Mr. Reade's report, and giving his own version thereof, Mr. Thomas said, "This matter had been kept from the public hitherto," and he considered it right that the ratepayers should "know whatever was in it," a statement with which we fully agree, provided the whole facts are stated; hence our reason for this letter, especially as our last and reports from the three architects accompanying the same have not been made public. First, as to the two "variations" referred to at the Board as made by us. One was the substitution of a solid 18-inch wall, built in cement, for a 9-inch cavity wall, as in plan, which was absolutely necessary to protect the adjoining property—only 4 feet distant—owing to the wet weather causing the ground to fall in, and demanding immediate attention to prevent accident to persons or property. We therefore dealt with it promptly in the interests of the Board. The other "variation" referred to being the non-drainage of a window area, owing to its level being below the public sewers—over which we had no control—and it was simply left for time to prove whether it had better be filled up or covered over with glass, both variations being known to and approved by the then Works Committee, as the following letter from the chairman to us abundantly proves:—

"25 Water Street: October 26, 1891.

"Messrs. C. O. Ellison & Son.—Gentlemen,—I am much astonished to hear that complaints are now being made as to the work at St. Michael's Schools, and feel it a pleasure as chairman of the Sites and Building Committee having charge of the work to say that, being often on the site during its execution, I was fully aware of the difficulties of the foundations, and with my committee thoroughly satisfied with not only the way you overcame them, but the general excellence of the work throughout, which will, I believe, bear the strictest scrutiny by unbiassed practical men.—Yours truly, SAMUEL HOUGH."

So much for the variations complained of by Mr. Thomas to the Board of which he was not even a member until a year or more after the schools had been completed and occupied. With reference to the so-called defects in the buildings which we, by the Board's request, reported upon fully in July last, and Mr. Reade more recently, when we found the latter report was being obtained, we wrote to the gentleman named offering him every possible information as to the buildings; and also requested, for our own satisfaction, three other architects of equal eminence with Mr. Reade to inspect and fully report to us on the same points, copies of all which reports we sent with our last letter to the Board; and we should be glad if the Board would publish them all in full, that the ratepayers may have the most complete information, instead of mere comments by Mr. Thomas on one side only.

We give the opinions of the three Liverpool architects who inspected the schools by our request, and whose reports we forwarded to the Board, inviting them to publish the whole; but as their meetings are only monthly, we think the substance of the reports should be given to the ratepayers whilst the matter is fresh in their minds.

Messrs. Thomas Wainwright & Son and Colonel Walker, F.S.I., made a joint report, which, after showing how practically baseless were the complaints made, concluded as follows:—"As to the premises generally, the more we examined them the more were we impressed with the unusually good quality and appearance of the work, and we know of no school buildings anywhere which have been so long in use and show less signs of the hard wear and tear of school work."

The report by Mr. T. D. Barry, C.E. (past president of the Liverpool Architectural Society), may be summed up in the following paragraph:—"Living in the immediate neighbourhood, I had frequent opportunities of seeing the work during its execution, and having visited the premises since their completion I can speak with every confidence as to their highly satisfactory condition, and have no hesitation in saying I believe the buildings are such as any Board ought to be proud of possessing or any architect of having carried out; and if the complaints as to the basement walls, which I was refused permission to see, have no better foundation than the others, of which I am able to express an opinion, they are small indeed, and, together with the refusal for inspection, point to a motive somewhere other than to ascertain the facts of the case."

In finally concluding our correspondence on this matter, we can but rejoice that in such extensive premises the most critical examination has left the complainant but a basement workshop to find fault with, and that actually unfinished, and with the earth only for a floor, by the then Board's own instructions three to four years ago, it being thought best (and wisely so) to leave the completion thereof until the time came for using the cellars, and their actual purpose could be defined. This time seems now to have arrived; and although we, as the architects,

are not to do the necessary work in "the usual way," we are glad to find that the floors are now to be concreted, and that the walls are sufficiently dry to allow of their being cemented over, although water had been allowed to run into them ever since the completion of the building two years ago, for want of flags in the common passage adjoining, and to which we called attention in our unheeded report of July last. As appears by the press report, we have, under the peculiar circumstances of this case, declined to be led into further correspondence in this matter with the Works Committee under its present chairman, but we are quite willing that the Board should publish all communications that have taken place between us, without comment or reservation.

In reply, Mr. Thomas writes:—A letter has recently been published emanating from Messrs. C. O. Ellison & Son, architects of the St. Michael's Schools for the above Board, and gravely reflecting upon me as a member of the same. Had these gentlemen merely confined themselves to defending their work, it would have been sufficient to leave their injudicious letter unanswered. The attempt to prejudice public opinion while the merits of this work are under consideration is too undignified and unprofessional to call for further notice. As, however, Messrs. Ellison & Son have endeavoured to import personalities, openly directed against me, into their "case" (which may tend to obscure the real issue in the minds of the public), I beg you to allow me to explain that, though otherwise I should be most happy to fully reply to their personal insinuations, I feel that this is not the fit time to do so. As a matter of professional etiquette, and in discharge of my public duty to the Toxteth School Board as chairman of the Works Committee, I willingly abandon all personal feeling, and am sure the Board will deal with Messrs. Ellison on their merits or demerits, as the case may be. A newspaper controversy (which, while professing to discontinue, they evidently desire to provoke) scarcely provides the proper means for practically investigating the quality or value of the work Messrs Ellison & Son have done. The Board, however, will doubtless prove quite competent to judge critically and equitably; and will not, I trust, be prejudiced even by the ill-advised action Messrs. C. O. Ellison & Son have taken.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the monthly meeting, the president, Mr. William J. Anderson, in the chair, a paper on Ruskin's "Stones of Venice" was read by Mr. L. Douglas Penman. The scope of the review was limited to the sections bearing particularly on the Venetian buildings, passing the less satisfactory portions devoted to disquisition on architecture in general, that are vitiated by the palpable bias of the writer, who throughout extravagantly eulogises Gothic and illiberally depreciates Renaissance art. His power of critical analysis is more admired, and with such a subject as St. Mark's there is full scope. His commentary is searching and suggestive, and always eloquent. By means of a fine series of photographs the features of the buildings of Venice were well illustrated. Mr. John Stewart opened the discussion which followed, after which the customary vote of thanks was passed to Mr. Penman.

DISTRICT SURVEYOR'S FEES.

IN the Court of Appeal, before the Master of the Rolls, Lord Justice Fry and Lord Justice Lopes, the case of Moir *v.* Williams was decided. It was an appeal from the decision of a Divisional Court, consisting of the Lord Chief Justice of England and Mr. Justice Mathew. Messrs. Moir, Wallis & Co. are builders. Mr. Williams is the district surveyor for Kensington, and in that capacity he surveyed, under the provisions of the Metropolitan Building Act, 1855, some new buildings in Kensington Court Gardens erected by Messrs. Moir. The question was as to the fees to which he was entitled for so doing. The buildings consist of fourteen separate sets of chambers under one roof, but intended to be separately occupied. They have only one entrance to the street and only one staircase, which entrance and staircase are common to all. Each set of chambers has its separate entrance, giving access to the common entrance and staircase. The separate sets are divided from each other horizontally by party arches and fireproof floors, and vertically by party walls. Mr. Williams claimed to be entitled to treat each set of chambers as a separate building, and to have fees for each accordingly. On the other hand, it was contended that the building was one building only. Mr. Curtis Bennett, the metropolitan police magistrate at West London, before whom the dispute came, decided in favour of Mr. Williams's contention, but his decision was reversed by the Divisional Court on a special case stated. Mr. Williams appealed.

The Attorney-General (Sir R. E. Webster, Q.C.) and Mr. A. J. Ram were for the appellant, and Mr. Finlay, Q.C., and Mr. Morten for the respondent.

The Court dismissed the appeal.

The Master of the Rolls said the question was whether this was one or fourteen buildings. The appellant had undertaken to survey all the buildings in a certain district, and he was entitled to certain fees. He was the surveyor under an Act of Parliament for a public body, and he was only entitled to the fees prescribed by that Act. Part I. of schedule 2 of the Act fixed a fee of so much for "every building" surveyed by him. The word "building" must be given its ordinary and natural meaning unless there were something in the Act which caused it to be construed differently. The ordinary sense in which the word was understood was a single block of brick or stonework covered in by a roof. That view was certainly assisted by section 51, which spoke of the surveyor's fees being payable within a month after "the building" was covered in with a roof. On the other hand, reliance was placed on section 27, which, in subsection 2, said that the sets of chambers in a building were to be deemed separate buildings. But when that section came to be examined it turned out to be only a series of rules or directions for the manner in which buildings should be separated. Therefore, the proviso as to sets of chambers being deemed to be separate buildings only referred to the provisions of that section, and could not be extended to the whole Act. Therefore, the buildings in question only constituted one building within the meaning of the Act, and the appellant was only entitled to one fee.

Lord Justice Fry concurred. This was certainly one building in the popular sense, and would be spoken of ordinarily by people as a handsome or an ugly building. But it was contended that section 27, subsection 2, compelled sets of chambers to be deemed for all purposes separate buildings, and therefore that this was not one but fourteen separate buildings. If that were so, it was difficult to see what was to become of the staircase, as to which the surveyor had certain duties, and which, according to that view, would not be included in any building at all. He was clear that the proviso only referred to the enactments as to separation of buildings contained in section 27, and was not intended to extend to the whole Act.

Lord Justice Lopes concurred.

ART AND COMMERCE.

THE paper which Mr. Alma-Tadema, R.A., composed for delivery at the Wednesbury Institute was read, in his absence, by the Hon. H. E. Stanhope. The author began by remarking that there was no National Gallery in England until 1825. Now, however, it was second to none of the great collections the world was proud of. They owed that gallery in a great part to the public spirit of several kind donors. Who knew but what the Wednesbury Art Gallery, which they opened so hopefully, might not in the future time grow into a most enviable collection, from which the art-student, art-lover and everyone else would have an opportunity of studying the great beautiful flower of the human mind and heart, viz. art, and draw visitors from far and near. Then would the time have come when the Wednesbury Institute would need no more ask a painter to come and talk to the members about art in connection with industry, because by their experience they would be able to teach others; their workers would grow up studying their collection, and would profit by it, and apply its lessons upon their productions, and the whole of the district would gain by it. He felt sure he was fully entitled to count on such a happy future. His subject was one of many-sided interest, and very difficult to define in its widespread branches—especially difficult for a man who was more accustomed to appeal to his public with paint and brushes, with forms and colours, than with pen and ink, with words of verbal explanation. Art was as yet an unexplained expression of the human mind; but he highly appreciated the remark of a Belgian artist of great repute, "The soul of the artist must be the looking-glass in which the beauty of nature is reflected," and he would add to it the motto of a dear lady friend of theirs, "As the sun colours flowers, so art colours life." If they accepted that art had to awake in the spectator a higher sense of the beautiful, then they came naturally to the origin of all things—nature. What did nature do? If buildings fell to ruins, or a landslip made an unsightly gash, nature at once set to work to make it beautiful again by hiding and covering with plants and flowers what had become an ugly gap and formless mass. In fact, she was always adorning everything with beauty; and that should teach them to be grateful for all beauty and all good. All this, however, was art in its highest form, but they must not be surprised to find art represented sometimes in a lesser degree of influence. Turning to the second part of the subject, he said industry meant the production of arts and manufactures, and as the manufacture was nothing but the execution of a subject given by art, there must exist between art and industry the greatest

tie possible; and the more they worked hand in hand the better it would be for both. Art and industry were, in fact, inseparable. He traced the development of art from early times, pointing out that art had never been at a standstill, but had been directing industry and forming new laws according to the fresh wants and the expression of the industry of the time being. In conclusion, he pointed out how the country was profiting by the study in the South Kensington Schools, and recommended manufacturers and industrial men to visit the half-yearly exhibitions of the results of these schools at South Kensington. He defended the South Kensington Art Schools from attacks often made against them, and claimed with Sir Frederick Leighton that they should copy the example of the ancient Greeks in making the human figure the basis of their study. Besides these special schools there were other things of great influence, like art galleries and collections of all sorts, and lectures, those with diagrams especially; but above all, a more technical education for the child, which until very recently received so little attention.

SHEFFIELD SOCIETY OF ARCHITECTS.

THE monthly meeting of the Sheffield Society was held at the School of Art on Tuesday night, the 10th inst., Mr. Innocent, the president, being in the chair.

The following gentlemen were nominated for the studentship of the Society:—Messrs. C. F. Innocent, Frank Wilson, Oscar Bromley, Brook Greaves, W. A. Hall and W. Woofinden.

A paper was read by Mr. E. M. Gibbs, vice-president, on "Architectural Education in Sheffield." He argued that the present system of pupilage, although well adapted to the learning of the practical duties of an architect's office, required further aids in pursuing the higher artistic and scientific studies called for by the programme, and he thought the want would be supplied by the establishment of a local class or studio on the lines of the new efforts of the London Architectural Association. Having explained this new departure, he regretted that all the classes had to be held and the studio opened in the evenings only; no doubt there was a good reason for this. He then reviewed the possibilities of establishing such a studio in Sheffield under the control of the Council of the Society, who would know best how to utilise to the full the advantages which such establishments as the School of Art, Firth College and the Technical School might offer to their students. One great object of such a studio would be the formation of a good architectural library. In conclusion, the lecturer trusted the architects of Sheffield would induce parents to give their sons the advantage of at least one year's training in the studio and classes before commencing their pupilage, and pupils should afterwards have ample time allowed them during the day for pursuing their higher studies, leaving them at liberty to devote their evenings to literature, music or the like.

THE SURVEYORS' INSTITUTION.

ON Monday Mr. R. C. Driver, president of the Surveyors' Institution, delivered his address. After congratulating the Institution on the increase of their members since May 1890 from 1,617 to nearly 2,300 of all classes, and the growth of professional literature as shown in the twenty-three volumes of "Transactions" and the four volumes of "Professional Notes," comprising together nearly 12,000 pages, he stated that there had been in existence for ten years a system of professional examinations as complete and thorough and as successful as anything of its kind in England. He also claimed that the Institution had done not a little to advance professional interests by binding surveyors together into an organised body, and by obtaining a charter which accredited them as duly qualified members of a regular profession. The Institution was not seldom the medium for the collection and communication of most valuable information for the use of Royal Commissions and Select Committees of both Houses of Parliament; but, above and beyond this, they had public functions of a specific kind conferred upon them by 41 and 42 Vict. c. 32, and section 28 of the London Council (General Powers) Act, 1890, the latter of the greatest importance as regarded the interests of that large class, the house and property owners of London. Mr. Driver then gave an interesting and elaborate analysis of the extent of the depreciation of land values during the last fourteen years, founded on the answers given to a circular letter sent out by the council in March last, in which the members of the provincial committees, some 800 in number, practising in every part of England and Wales, were asked to furnish the council with their opinions. The response was a very large amount of information of what appeared to be of a somewhat contradictory kind, but on closer examination it was found that most of the discrepancies could be got rid of by eliminating those returns which applied to whole counties or groups of counties. These evidently represented an attempt to generalise, and usually erred on the side of despondency. By confining attention to those returns which referred to more limited areas within the estimator's personal experience, it was found that a reasonable average could be arrived at. It appeared from the tables founded on these returns that the Chiltern Hills district of Oxfordshire had the unenviable position of head of the list, with an average reduction of 75 per cent., and South-east Essex was not far behind with 70 per cent. Indeed, had one of the extreme figures been incorporated with the average, the latter would have been *facile princeps* in this sorry competition. East and West Cambridgeshire followed with the high depreciation percentage of 60. In North Essex 55 per cent. appeared to represent the average depreciation, and 60 per cent. of the farms were unlet. The 50 per cent. depreciation in North-east, South and Mid Essex and in North and South-west Berks, the 46 per cent. in East Wilts and the 45 per cent. in North Hants, were averages based on a large number of returns, but which took no account of extreme figures. The only other abnormal figures not incorporated in the averages were 60 per cent. (clay soils) in South-east Warwick, 60 per cent. in the Bristol district of Gloucester, 60 per cent. in the Bristol district of Somerset, 50 per cent. in South Kent, 50 per cent. in West Sussex, and 50 per cent. in remote districts of Surrey. Generally, two facts appeared from this return—the first, that the depreciation over the heavy wheat land had not been overstated by common report; the second, that the depreciation in the pasture and dairy districts was somewhat less than had been previously supposed. It was also clear, from figures brought before him, but not printed in the address, that the depreciation had been far less in farms from 50 acres to 200 acres than in the larger farms. He might state, finally, that as the agreement between individual estimators was even closer in the figures under 20 per cent., farmers were, at all events, holding their own over a large part of England, and that landlords in the same districts had not been quite impoverished. Nevertheless, the fact remained that in some parts of the country a serious depreciation in land values had taken place. What were the causes and whence was the remedy to come As to the causes there was now a practical agreement that they were bad seasons, cheap imports and low freights. The remedies therefore were better seasons, absorption of the surplus food-stuffs at the places of origin, and a general rise of freights, to which some would perhaps add a higher rate of home production and an improvement in the effectiveness of labour. He had been favoured, by the courtesy of the officials of the Board of Trade, with an advance copy of the statistical abstract for the year 1890. This showed the imports of wheat (grain, meal, flour) for the years 1886-90. From Russia the imports of grain for the several years in cwts. were for 1886, 3,720,662; 1887, 5,501,380; 1888, 21,450,346; 1889, 21,310,304; 1890, 19,389,025. In meal and flour for the same years the quantities in cwts. were 3,743,272, 5,544,365, 21,682,890, 21,546,409 and 19,585,249. From Roumania the imports of grain, meal, &c., had steadily risen from 290,248 cwts. in 1886 to 4,663,227 cwts. in 1890. The returns from the United States were much more fluctuating and the number of cwts. of grain for the several years were 24,648,581, 30,530,263, 14,643,572, 17,009,036 and 17,201,063, whilst of meal they were 36,073,832, 45,390,678, 27,202,212, 27,052,756 and 29,226,863. From British India the returns varied between eight and eleven million cwts., the amount last year being 9,111,613 cwts. Last year from Australasia there were imported 3,188,833 cwts. of grain, meal, &c, as compared with 811,391 cwts. in 1886. The returns showed that the increase in the year 1890 in the imports of wheat, viz. 3,451,813 cwts., had been more than balanced by the decrease in the imports of barley, 722,922 cwts., and of oats 3,263,381, which, of course, was not without its effect upon prices. The failure of the Russian harvest and the consequent absorption of local stocks would probably weaken, for a time at any rate, one of the British farmer's most formidable competitors. The American harvest had been exceptionally good this year, but their exports of grain could hardly be long maintained on their present scale in face of the enormous growth of the population of that country. After referring to the depletion of the country districts and the fact that there was a decided decline in population in five English and nine Welsh counties, Mr. Driver commented on the re-establishment of the Board of Agriculture, which did such valuable work under the inspiring genius of Arthur Young. Criticising adversely the modern system of subventions in aid of rates (a system very antagonistic to the principle of popular control over local taxation), Mr. Driver examined the Acts under which the 750,000*l.* placed at the Government's disposal by the rejection of its licensing proposals was to be expended—the Technical Instruction Acts, 1889-91. He confessed to considerable doubts as to the practical outcome of this new departure, which might be described as an extravagant endowment of non-existent agencies for purposes yet to be determined. Had not the exigencies of

haute finance ruled it otherwise, it would have appeared to any practical mind that a well-digested scheme of technical education should have preceded its endowment. It was to be hoped that the Tithe Rent-charge Recovery Act of last session had taken the sting out of an agitation which might have been wider in its effects than its promoters supposed, or at any rate cared to admit. It was disappointing to learn that the long-promised metropolitan improvements were again deferred owing to a difference of opinion between our local and our Imperial Parliaments as to (not to use a word endued with latent heat) "the principle of assessing a special rate upon property which is shown to be increased in value by an improvement carried out at the public expense." The definition was Mr. H. H. Fowler's. He strongly objected to the principle. It was not accurate to ascribe the increase in the value of town land and buildings in any large degree to "communal expenditure." The values of such property rose because of the presence and prosperity of the surrounding community. Moreover, it was very clearly proved that, as a matter of fact and not of theory, rates, at any rate as regards London property, do already "come out of property." But, if the necessity for increasing the burden on property really existed, the separate assessment of sites would involve the payment of rates on ground rents by owners who had in many cases given high prices for these rents as investments, on the faith of the contract with the lessees that the ground rents should be paid free of deductions for rates. To alter the terms of the contract by enforcing the deduction of a share of the rates from those ground rents would obviously not only deprive ground rent owners of a part of the income for which they had paid a specially high price, but would seriously diminish the capital value of their investment by introducing the element of uncertainty into it. Equally cogent reasons could be assigned against the rating of vacant building land. Mr. Driver concluded his interesting address with an examination of the subjects of papers to be read during the session.

THE DOUBLE ROOF-MARKS ON JEDBURGH ABBEY.

THE double roof-marks on the Abbey of Jedburgh have been a puzzle both to architects and antiquaries. Not that it is uncommon to find double roof-marks on old buildings —even three are sometimes to be met with—but in the case of Jedburgh there is something peculiar, as will be shown in the course of the following notes. These double roof-marks are seen on the west side of the tower and in the nave. We remember having some years ago asked an architect, says a correspondent of the *Scotsman*, who was making a sketch of the Abbey, if he could offer any explanation as to these, and he replied that there was nothing easier, as they were simply marks of roofs of different periods. A few more questions, however, convinced him that the subject presented more difficulties than he at first dreamed of. It has been suggested that the lower "ragglet" of the nave aisles marks the pitch of the earliest roof, and that as the arches of the triforium rose above this roof the arches would be used as windows to light the centre of the nave until the clerestory was built. This is taken for granted, that the clerestory is of a later period than the under portion, while it is of the same transition Norman character, possessing, no doubt, features of its own. In a few instances such an arrangement had been adopted where it was found necessary to delay the erection of the clerestory for some time, but this does not seem to have been the case in Jedburgh. Besides, the double roof-marks on Jedburgh Abbey, as we are about to show, did not exist until at least two centuries and a half after the completion of the nave, which could not be later than the early part of the thirteenth century. As a proof of this, we may mention that the walls on which the markings are seen cannot be of earlier date than the latter part of the fifteenth century. At the east end of the north aisle there is a small portion of a Norman arch, and this arch, if entire, would have been crossed by the lower "ragglet"—though Billings in his drawing erroneously restores the arch in such a way as to be clear of it—and that of itself would go against the idea of this being the mark of the original roof. A very slight examination will show that there has been considerable alteration at this place. The north pier which originally supported the arch has disappeared, and a dead wall has been substituted. Then, again, by an examination of the east end of the south aisle it will be observed that here also there has been great alteration. When Abbot Thomas Cranston rebuilt the south-west pier of the tower he, heedless of the original plan, threw an arch over from that pier to the Norman pier near to the cloister doorway, much lower than the Norman arch, a fragment of which still remains, and again a dead wall fills the space between the newer pier and the old work above the arch. On the face of this dead wall double roof-marks are seen. Cranston also renewed the lower portion of the north-west pier of the tower, and it is not improbable that the dead wall referred to at the east end of the north aisle was built by him so as to strengthen the said pier. He also rebuilt at least part of the west wall of the tower. Cranston was Abbot before February 1484, and he still held office in 1494. Now this gives us a very near approximation to the date of the earliest of the roof-markings. We think that there can be little doubt that the upper one was the earlier of the two. It rises from the top of the aisle wall and goes up to the row of corbels immediately under the clerestory, these corbels being for the purpose of supporting the roof. When the tower was rebuilt at the end of the fifteenth century a roof of similar pitch was put up over the centre of the nave, as shown by the projecting "ragglet," and this was done, no doubt, so as to correspond with the gable-head at the west end. The upper part of the west gable does not now quite agree with this "ragglet," but this is owing to the gable-head having been taken down and rebuilt at the early part of the present century. The roof over the chancel was of the same pitch, as may be seen by the mark on the east wall of the tower. But what about the lower marking? That it cannot be the mark of an inner roof, as some have suggested, is clearly proved by the fragments of a water tablet, or drip-stone, which still remain in some of the cuttings on both sides of the nave, immediately above where this roof would join the wall; and also by the marking on the south wall of the tower, a little above the stone-vaulted roof of the transept, and which crosses an opening there in the same way as the lower marking on the west. It must therefore have been an outer one; but when could a new roof be rendered necessary? When the ends of the timber became decayed it was not unusual to cut off the decayed parts and lower the roof. In the case of Jedburgh Abbey, however, much more was done than the mere lowering, for along the whole length of the nave two cuttings—one for resting the top of the side aisle roof, and the other for the insertion of a drip-stone to throw off the water—have been made just at the spring of the including arches of the triforium, and this would necessitate the filling up of the subdividing arches in some way, but whether by windows or otherwise the effect would be anything but pleasing. Regarding the central roof of the nave matters are no less puzzling. The lower roof had crossed an opening in the under storey of the tower in the same way, a portion of the arch having been left outside; and it must also have crossed the St. Catherine's wheel at the west end, unless by some peculiar arrangement it was raised at that part. We can find another reason than the decay of the timber here that necessitated a change. In 1523, probably within thirty years of the erection of the former roof, the Abbey was burned by the English under the Earl of Surrey, after a whole day's cannonading, and at that time, we suspect, the nave and its aisles were rendered roofless. As there are no double roof-marks on the east and north sides of the tower, we may naturally infer that the chancel and north transept did not share the same fate as the nave at the date mentioned. It seems strange that in repairing the damage done by this destructive burning the roofs were not put up on the old lines, but in a position that entailed greater labour, and which must have spoiled all æsthetic effect. The next visits of the "auld enemies" were in 1544–45, when the whole Abbey was so sadly wrecked that no attempt was made to restore it, the canons contenting themselves with erecting a place under the tower for the carrying on of worship. The remains of this erection, which have come down to our day, are rude enough to show either that the taste of the canons had by that time become very much debased, or, what is more likely, that they had then no heart to restore their church to anything like its former beauty—a church that had undergone many vicissitudes and which was before long likely to undergo more. The thunder notes of the coming Reformation had been already heard, and were becoming louder and louder at the nearer approach of the storm.

PERSIAN ART.

THE opening lecture of the session of the Edinburgh branch of the British Typographia was delivered by Major-General Sir R. Murdoch Smith, director of the Museum of Science and Art. The subject was "The Place of Caligraphy in Persian Art," and the lecturer pointed out, to begin with, that printing from movable types was hardly, if at all, known in Persia. They were, however, the greatest adepts in the world in the nearly allied art of caligraphy, which was regarded among them as one of the fine arts. By way of introduction of the subject, he briefly sketched the character of the people, who were essentially western in their habit of mind, and he laid particular stress upon their imaginative faculty and inventiveness. He then proceeded to show how the development of Persian art was exhibited in the architecture of the country, and how it had accommodated itself to the limited materials at the builder's command. The material for the most part at the command of the builder was sun-dried brick, and the feature of

the architecture was the niching of the walls within and without, the use of stalactite-like pendants to ornament these niches, the ornamental arrangement of the brickwork, specially the indenting of the walls to give the effect of light and shade, and the adorning of the wall-surfaces with ornamental wall-tiles or mosaics. Some of the features of Oriental architecture imitated in this country and attributed to the Moors were, the lecturer said, really Persian in their origin. It was in the mosaic word decoration of walls that the use of caligraphy came in, and it served the double purpose of ornamentation and the inculcation of good precepts. The lecturer exhibited examples of this style of decoration on the spandrels of arches and of lintels and posts of gateways. In the same way he showed how the use of caligraphy entered into the ornamental scheme of tilework and earthenware generally, textiles and metalwork, and he exhibited examples of each mostly belonging to old Persian art, in which caligraphy for decorative purposes was beautifully applied in varied ways. Islamism in prohibiting anything which might be described as an image in Persian decoration had exercised a limiting influence on the art of the country, but the inventiveness of the people had enabled them either to evade the Koranic injunction, of which amusing examples were given, or had found an outlet in other directions. Every conceivable material had been pressed into the service of art, and he thought it might safely be said that it had touched nothing which it had not adorned. Perhaps no other race had shown greater originality in artistic faculty, and certainly none had exercised it through such a long succession of centuries. In many of our arts and industries in this country we were at the present moment either modifying or reproducing, consciously or unconsciously, designs which long ago emanated from the fertile imagination of our distant kinsmen of Iran.

CROYLAND ABBEY.

ANOTHER appeal for funds for the works at Croyland Abbey has come from the rector, the Rev. T. H. Le Bœuf. He writes:—I regret to state that since we recommenced the work on August 21, 1891, I have received only 86*l.* for section 7 and paid 208*l.* 15*s.*, whilst the cost of that section of work alone is 440*l.* 15*s.* The work done this year has been the repointing of the steeple (inside and outside) and north side of the tower, and making firm the pockets of the steeple in concrete. (Would that some kind friend made firm the pocket of the treasurer of the Croyland Abbey Preservation Fund!) The work in progress is the rebuilding of the squinch arches of the steeple and repairing the bell-chamber. The renowned bells of Croyland have not been rung for over three years by reason of the decayed condition of the oak beams which support the bell frame. I trust that this note may be read by some kind friend who may send us help direct, or be the means of bringing our great need before those who have the power to help us. Surely even a small donation from every member of our great antiquarian, archæological, historical and architectural societies would quickly remove our burden and enable us to make safe an abbey which dates as far back as the days of King Ethelbald, 716 A.D. Shall such societies suffer so venerable a building, so distinguished a landmark in our English history, as Croyland Abbey to fall into utter ruin? Have they not often admired and written volumes on this grand Benedictine monastery—the architectural fragments of successive mediæval centuries and legendary history? Shall not the readers of Kingsley's "Hereward the Wake" awake and feel an interest in Croyland Abbey and come and help us? Crowlanders can do little, as we suffer from agricultural depression, enfranchisement of copyhold property, and also from a heavy drainage tax of 10*s.* per acre, which, alas! does not prevent our land from being frequently under water, as it is for many acres at this present moment by the overflow of the river Welland. Therefore the necessity of my appeal beyond our parochial boundaries. Surely English Churchmen of the present day feel that they form the connecting link between the past and the future, and will help us to hand down to future generations this venerable national relic of past ages.

ARCHITECTURE—A PROFESSION OR AN ART?

THE following letter from Mr. Norman Shaw, R.A., appeared in the *Times* on Wednesday:—

Sir,—In the report of the opening address at the Royal Institute of British Architects contained in your issue of November 5, the President refers to a memorial sent to the Institute some months ago, signed by a considerable number of architects and many well-known painters and sculptors, protesting against the attempt now being made by the Institute to transform architecture from an art into a close profession by the introduction of a system of examinations and diplomas. The contention of the memorialists is that architecture is an art and not a profession; that artistic qualities (those qualities which make a man an architect) cannot be brought to the test of examination; and that a diploma of architecture gained by such means would be a fallacious distinction, equally useless as a guide to the public and misleading as an object for the efforts of the student. The views of the Institute and of the memorialists are too entirely opposed to be reconciled by the bland appeals and pointless platitudes of the President's address. The memorialists maintain that architecture is an art on precisely the same footing as painting and sculpture. The President of the Institute, with the full approval of its leaders, maintains that architecture is two-thirds a profession or business and one-third only an art. He divides those who practise architecture into three classes:—First, those whose proclivities are artistic; second, those whose genius is constructive; and third, those who *par excellence* are men of business, and who are presumably entirely wanting in the faculty of design. The memorialists also make this distinction, and they are fully alive to the necessity of good construction, but they think that the men forming the last two divisions are, as such, not architects at all. The scientific constructor already exists in the engineer, the business man in the surveyor and commission agent; but the Institute and its President indulge in no such nice distinctions. Students are to be indiscriminately examined entirely regardless of their natural qualifications. They are to receive the same diploma, which admittedly implies no power of design and a bare minimum of technical knowledge, whilst the public, whom the Institute is so anxious to help, will be left to discriminate for itself as best it can. Does not this line of action amply justify the memorialists, and does it not indicate only too plainly that the Institute, while professing to protect the public, is attempting to protect the architects; that it has never cared about art at all, but has expended such force as it has entirely on professionalism—that is, on the manufacture and protection of architects who shall be members of the Institute, rather than on the help and furtherance of the art of architecture?—I am, sir, yours faithfully, R. Norman Shaw, R.A.

MEMORIAL BUILDINGS AT THE HOLT, RAINHILL.

THE extensive memorial buildings which have been in progress during the past eighteen months have now reached a successful completion, and have been formally opened. The buildings have been erected at the sole cost of Miss Ruth Evans, in memory of her brother, the late Mr. Joseph Evans, colliery proprietor, of Haydock, to whose memory also Miss Evans is erecting large church and school buildings at Haydock and extensive elementary school buildings at Ashton-in-Makerfield, the total cost of the combined schemes, including land, being about 25,000*l.* The whole of the buildings are rapidly approaching completion from the designs and under the personal supervision of Mr. Thomas W. Cubbon, architect, of Birkenhead, the contractors being Messrs. Hughes & Stirling, of Liverpool and Bootle. The principal portion of the Holt buildings is the church, providing sitting-accommodation on the ground floor for about 650, having organ-chamber, vestry and cloak-room accommodation at the rear. The style of the design is Late Gothic in character, the plan of the church being cruciform, having chancel and transepts. The clerestory is carried upon handsomely-moulded arches supported upon massive octagon pillars, having richly-moulded caps and bases all of white Cefn stone, as are also chancel, transept and organ-chamber arches. One main front entrance and two side entrances are provided in addition to rear entrances. The buildings are faced externally with local red sandstone, and all the internal woodwork is of pitch-pine, toned and varnished. The rostrum, which is of handsome design, is constructed of selected pitch-pine, the angle shafts being ebonised, and other features richly moulded and carved. The traceried windows are filled in with enriched leadlights of beautiful design. The gasfittings, encaustic tiling, vestibule screens and decorative work have all been designed in harmony with the main structure. A handsome tower with spire occupies the south-west angle of the main building, and, rising as it does to an altitude of over 120 feet, is seen for many miles on all sides. The Sunday-school buildings consist of a large assembly hall, capable of accommodating over 300 children, and having in conjunction therewith four classrooms, each for about 18 scholars.

There is also a swimming-bath, 50 feet in length and 23 feet wide, having the sides lined with white enamelled bricks, and the bottom laid with heavy white tiles on a concrete bed. There are also a gymnasium, clubhouse and cocoa-rooms, with two large reading-rooms on the first floor, and a commodious residence for manager, accommodation for bicyclists, &c. The

principal sub-contractors employed upon the works were as follows:—Engineering to swimming-bath and heating, Messrs. Bradford, of Salford; leadlights and gasfittings, Messrs. Greatrix, Manchester; plumbing, painting and glazing, Mr. R. Robinson, of Birkenhead; wrought-iron art-work, Messrs. Hardman & Powell, of Birmingham; gates and railings, &c., Messrs. Macfarlane, of Glasgow; slating and plastering, Mr. Moore, of Manchester. General foreman, employed by Messrs. Hughes & Stirling (sole contractors), Mr. Clydesdale. The cost of these buildings, including furnishing, heating, lighting, ventilating, engineering to swimming-bath, organ and site, is over 10,000*l.*

CHURCH BUILDING AND RESTORATION.

Bowness.—The parish church of St. Michael has been re-opened after restoration, carried out from the plans of Mr. G. D. Oliver, architect, Carlisle. The works have been very carefully carried out by Mr. Joseph Crosthwaite, builder; Messrs. W. & H. Davidson, carpenters and joiners; Mr. G. Nicholson, of Wigton, concrete floors; Mr. Nanson, slater; Mr. Palmer, painter and glazier; and Mr. W. Anderson, plumber.

West Dulwich.—All Saints Church, Rosendale Road, has been opened. The building has been designed by Mr. George H. Fellowes Prynne, F.R.I.B.A., and tenders for the whole work obtained. The funds being inadequate, it was determined to build the church in sections. The first contract included the foundations at the east end, which were carried out by Messrs. Kynoch & Co. The second contract includes crypt, chancel, chapel, vestries, north and south transepts and four out of seven bays of the nave, the flèche and tower being, for want of funds, temporarily cut off at roof level. The present contract has been carried to completion by the firm of Messrs. J. & C. Bowyer, of Upper Norwood. The main scheme of the church shows a lofty nave 60 feet high and 40 feet wide and 128 feet in length, divided into seven double-arched bays, the piers being built of red brick and stone. Panels for decoration are formed over lower arches, and a clerestory in spandrels above. Three eastern bays open into the north and south transepts. The chancel and sanctuary are the same height as nave, 28 feet wide, 44 feet in length. The altar is placed ten steps above the nave floor level, and a good effect obtained both externally and internally by seven lofty windows at eastern end. The dividing arch between the chancel and nave is enriched with tracery supported by two slender columns rising from the lower screen. A wrought-iron rood screen spans the spaces between columns. This screen is one of the main points of the building, rising 54 feet to apex. The northern transept forms the nave of a chapel, the sanctuary of which is placed on the northern side of the chancel; clergy and choir vestries and organ-chamber are placed on the south side of chancel. An ambulatory runs entirely around the east end of chapel and chancel, connecting the northern turret with the vestries. The present portion of the church will accommodate about 1,000 persons.

NEW BUILDINGS.

Droitwich.—The Worcestershire Brine Baths Hotel (a view of which appeared in our issue of May 22 last) was opened on Wednesday last by a dinner given by Mr. John Corbett, M.P. Upwards of 300 sat down to a most liberal repast. The building has been erected at his own cost for the benefit of visitors to the brine baths. It is built in the old half-timbered style, the materials used being brick, timber and rough cast at a cost of 15,000*l.* The internal arrangements provide all that could be desired. Throughout it is most beautifully decorated, the ceilings being handsomely painted and encircled by gilded mouldings, the walls elegantly papered and the rooms most lavishly furnished. In the centre of the hotel is the main entrance with a *porte cochère*. On passing through the doorway the visitor walks into a spacious hall, which is intersected at right angles by a lofty well lighted corridor 10 feet wide. On the right is the office and on the left is the manager's room, and before him is the main staircase. This is of mahogany and pitch-pine; the soffits are of walnut and white wood. The coffee-room is 42 feet by 30 feet, the ceiling of which is divided into six panels, which are enriched by cornices 3 feet 6 inches in girth, and are picked out in eight colours, and the enrichments are gilded. The flats of the panels are decorated in the style of Louis XIV. In the centre of the room are two columns, the shafts painted to imitate rouge royal marble, the pedestals of Irish-green marble, the mouldings being gilded and white enamelled. The capitals are Corinthian in design and are decorated in white and gold. The woodwork is American walnut, with black-and-gold mouldings. In connection with this room is the gentlemen's writing-room. The drawing-room, 40 feet by 20 feet, is in two sections, being divided by an arch springing from two pilasters. The cornice, 3 feet 6 inches in girth, and capitals are treated in a similar manner to the dining-room, in light-tinted colours, gold being freely used. The flats of the ceiling are delicately painted. The chimneypieces and overmantels are of oak, richly carved and moulded. Leading from this room is the ladies' writing-room. There are two extensive lounges, one on the ground-floor and one on the first floor. These are treated in a similar manner to the drawing-room. Total number of bedrooms, 96; and on the ground-floor, first floor and second floor are six suites of rooms, each comprising sitting-room, bedroom, dressing-room and bath-room. The architect is Mr. John Robert Nichols, M.S.A., 59 Colmore Row, Birmingham; the contractor Mr. C. A. Horton, of Brierley Hill. The warming and culinary arrangements were supplied by Messrs. Clements, Jeakes & Co., London. The lifts by Messrs. Waygood & Co., London. The sanitary arrangements by Messrs. Doulton & Co., London. The decorations have been executed by Mr. Arthur Gee, of Stafford. The gasfittings by Messrs. Winfield & Co., Birmingham. The electric bells by Mr. E. Hill, of Birmingham. The stained-glass work has been executed by Mr. S. Evans, of Smethwick. Messrs. White & Son, of Worcester, laid out the grounds under the direction of Mr. Parker, Mr. Corbett's head gardener.

Birmingham.—The Masonic rooms in Severn Street have been opened. The architects engaged in the work of reconstruction and decoration were Messrs. Essex & Nicol, of Birmingham; the general contractor being Mr. Moorhouse, of Birchfield; the decorative work being carried out by Mr. John Taylor, of Broad Street.

Leith.—The new council-chamber at Leith was occupied for the first time for the first statutory meeting since the election took place. The new council-room is 22 feet by 34 feet 9 inches, with a height of ceiling of 17 feet 6 inches. There are five windows to Charlotte Street and two to Constitution Street. The ceiling is divided into several panels, the main panel having circular and oval wreaths and other ornaments. The ceiling, which has been formed with stucco of the finest quality, is enriched with ornaments designed and modelled expressly for it. The walls have been plastered and finished with framed, panelled and polished walnut, and the division separating the public part of the room is also of polished walnut. The floor is laid with oak, divided into panels and border designs carried out in walnut. The room is lighted by three Wenham lights specially designed to correspond with the architecture of the room. There have also been added a cloak-room, a retiring-room for the members and spacious lavatories. The following were the principal contractors:—Masonwork, Wm. Baxter, Leith; joinerwork, Drysdale & Gilmour, Leith; plumber and gasfitting work, Thos. Macpherson, Leith; plasterwork, J. S. Sutherland, Leith; painting work, Bonnar & Carfrae, Edinburgh; furnishing, Messrs. Miller & Son, Leith.

GENERAL.

The Royal Scottish Society of Water-Colours holds its exhibition this year in the Institute Rooms, Glasgow. One hundred and ninety-three drawings have been hung.

Works intended for the next Annual Exhibition of the Royal Hibernian Academy will be received up to February 5.

The Royal Cambrian Academy Exhibition, which has just closed, was visited by 10,172 persons, and 114 pictures were sold, realising 2,358*l.*

An Obelisk of red and grey granite, 20 feet in height, with drinking-fountain and troughs for cattle, has been presented to the Corporation of Newcastle-upon-Tyne as a centenary memorial of John Wesley.

A Carved Table, used by James II. during his visit to Cork, was sold a few days ago in that city for six and a half guineas.

Mr. Samson Fox, C.E., has been re-elected Mayor of Harrogate.

The Birmingham Architectural Association will have a conversazione on Wednesday next in the Edgbaston Assembly Rooms.

Mr. W. J. Wainwright intends to present to the Birmingham Art Gallery the portrait of the late Mr. Henshaw, painted by himself.

A Relic of early times in the shape of a canoe, formed out of a solid trunk of oak, has lately been unearthed during the course of repairs to the banks of the Clyde.

The Longton Town Council have approved of the Aynsley memorial clock tower and fountain for the Queen's Park, which they have decided should be erected in the centre of the triangular bed opposite the Carlisle Street entrance.

At the Meeting of the Staffordshire County Council the General Purposes Committee reported that they had concluded arrangements for purchasing Eastgate House and other properties extending therefrom to the Judges' House, for the purpose of Council committee-rooms, offices, &c.

The Architect.

THE WEEK.

For several years past there has been talk about the purification of the river Liffey, which, like a diameter, divides "dear, dirty Dublin." The Government have instituted inquiries from time to time, and many engineers have prepared schemes of improvement. The river serves as an open sewer, and it is the most malodorous in Europe, but there is evidence to show that the inhabitants of the houses on both sides do not suffer from the emanations which are so overpowering to strangers. Whether the river affects the health of people in other parts of the city can hardly be ascertained. The death-rate is very high, but unfortunately there are many other causes besides the Liffey to account for it. If the river must be used as the main sewer it would be well to adopt the plan of the late Henry MacManus, the artist, and throw an arching across, uniting the quays. But, as in other places, it would be preferable to construct special sewers, and there is not much difficulty in discovering places north and south of the city which would serve for the deposit of the sewage—that is, if utilisation must be abandoned. The Corporation propose at length to deal with the problem, and a scheme has been adopted which is to cost 250,000*l.* According to the plans, the whole of the sewage is to be carried to a spot near the Pigeon House, beyond Ringsend, where the Liffey enters the Bay of Dublin. It will be necessary to bring the main sewer of the north side of the city beneath the river, but that is not a difficult operation. Precipitating tanks will be erected, and the effluent water will probably not be more polluted than what falls into the Thames at Chiswick or Mortlake. But as the Pigeon House has some importance as a fort, the War Office will no doubt provide that danger cannot arise to troops. An effort will be made to avoid the expense of a Parliamentary inquiry and the inevitable opposition to a Bill. It is believed that an order under the Public Health Act will give the necessary authority for undertaking the works and to enable the Corporation to obtain any land that may be required as a site for the tanks and machinery.

It is to be regretted that Mr. Rogers was not successful in his action to recover 123*l.*, the balance of his fees as architect of a house at Brockley. We narrated the circumstances when the case was tried at Maidstone. It will be remembered that the defendant counterclaimed for damages for negligence, owing to the plaintiff's not properly supervising the building of the house, in consequence of which the builder omitted to put concrete into the foundations and omitted to do other works. The plaintiff denied that he was negligent, and further stated that, in giving his final certificate to the builder, he deducted 82*l.* in respect of the omissions from the amount certified to be due to the builder, and contended that this certificate was binding upon the defendant under clause 16 of the contract between the defendant and the builder. Clause 16 of the contract deed provided that "the decision of the architect with respect to the amount, state and condition of the works actually executed, and also in respect of any and every question that may arise concerning the construction of the present contract, or the plans and specification or the execution of the works hereby contracted for or in anywise relating thereto, shall be final and without appeal." The jury found that the plaintiff had been guilty of negligence, and found a verdict for the plaintiff on the claim for 58*l.*, and for the defendant on the counterclaim for 90*l.* In the Court of Appeal it was argued on behalf of Mr. Rogers that the final certificate was binding on the building owner as well as the builder. The Master of the Rolls, however, declared that was not the law. According to his lordship the certificate was final as between the building-owner and the builder. Any question as between the building-owner and the architect would not be decided by that certificate. As between the building-owner and the builder the architect had, in the honest exercise of his judgment, awarded a sum which the building-owner could not question. As against the architect the building-owner could question that. The jury had found that the architect was negligent and that the architect had not awarded sufficient. The learned judge was satisfied with the verdict and a new trial could not be granted. Whether the Court would have arrived at the same verdict was not now the question. The other members of the Court of Appeal concurred in that view. The case opens out the possibilities of many novel actions, and it is evident that after the completion of a building and what appears to be a settlement, a building-owner can impugn an architect's judgment, and a jury may say that in an affair of deductions they are wiser and better informed than the architect.

It may now be laid down as a sort of legal maxim that any name found on a map or in an index to an atlas is unsuited for a trade-mark, unless the user has no objection to imitation by his rivals. The recent decisions in the Courts support our theory, and it is no wonder the ironmasters are in alarm about the value of many designations of brands. The latest illustration of the risk of having recourse to geographical or topographical titles is in the action brought by the well-established Rugby Portland Cement Company to prevent the use of the title "Rugby Portland" by another company. The suit has been going on since April, 1890. When it was heard before Mr. Justice Vaughan Williams, his lordship held that there was no evidence of infringement of the trade-mark as a whole, since the word "Rugby," as applied to cement, was known in the trade not as distinguishing the plaintiffs' goods, but as denoting the cement made of the stratum of blue lias existing in the Rugby district. The case was, therefore, dismissed. The plaintiffs appealed, and their counsel argued that, as neither the plaintiffs' nor the defendants' works were to be found in the town of Rugby, and as the plaintiffs had acquired a reputation for cement under the name of "Rugby Portland Cement," the defendants had no right to use the same name. If there was no intention to take advantage of the name by which the plaintiffs' cement was known in the trade, it was difficult to understand why the defendants should have taken again a title which their predecessors abandoned twelve years ago, and called themselves the Rugby and Newbold Cement Company? If Rugby cement was merely a term used to describe cement from the neighbourhood of Rugby, the defendants would have been equally entitled to use it when they were the Newbold Cement Company. But as it could not be proved that Rugby cement implied more than cement derived from Rugby, the Court of Appeal confirmed the former decision. The result will, no doubt, cause much inconvenience throughout the country, for a long employment of a term, and its acceptance by others, does not get over the objection which the Courts have for all words or phrases which relate to land or other things that are not the exclusive property of the user. The safest trade-mark is one which is specially devised, and is not to be found in a dictionary.

The makers of boxes for bon-bons in France will have to be careful about the subjects they select for the pictorial adornment of their productions. The law of copyright affects them. It might be supposed that artists would be glad to have their works popularised, but in France there is a craze about infringements of copyright at the present time. One of the latest cases relates to a picture *Les Infortunes de Pierrot*, by M. Loire. He authorised a firm of photographers to reproduce his painting and sell the photographs. Some were purchased by a firm engaged in the making of bon-bon boxes. The photographs were copied, and, according to custom, the copies were produced in colours on the boxes. The artist took action for invasion of copyright. While admitting the right to take monochrome copies, he objected to coloured copies and to the application of his work to confectioners' boxes. The first Court where the action was tried gave judgment in favour of M. Loire and awarded him 300 francs damages. The makers appealed, but the painter again was victorious. The decision is of importance to the trade, especially at a time when preparations are being made for getting up new year's gifts in France.

ANTOINE WATTEAU.*

THE indifference of the French people about the works of their countryman, ANTOINE WATTEAU, during more than a century, appears incomprehensible; it is, however, easily explained. At the beginning of the eighteenth century, as in the present time, the French cared only for pictures with which they could associate themselves. High art which produced the sculpturesque scenes of NICOLAS POUSSIN, the severe Carthusian series of LE SUEUR, the dramatic scripture pieces of JEAN JOUVENET, had in the hands of LEBRUN become one of the most effective means of puffing for a king who was the greatest of royal advertisers. The pageants which LEBRUN depicted with unquestionable power were accepted by the French as a glorification of their own greatness. As in the classic dramas, the figures might appear as Greeks and Romans, but everybody believed they were Frenchmen, and it was felt that a compliment was offered by identifying French with ancient heroes. When the Grand Monarque passed away there was a change, and it was no longer possible to find money for covering acres of canvas with representations of martial exploits. But the belief in the virtue of imitating the "great masters" still prevailed. The highest encomium that could be bestowed on a French artist was to associate his name with an Italian's. BLANCHARD was the "French TITIAN," BAUGIN the "little GUIDO;" MIGNARD was the Roman, so was LOUIS LENAIN, and LEBRUN the Arch-Roman. Under such circumstances, what chance of success awaited a painter like WATTEAU, who was not historically inclined nor nurtured among the faithful devotees of the "gusto grande?" The past was of no account to WATTEAU, and he was no less indifferent to the present as it was then exhibited in France. M. DARGENTY, in claiming for the painter the right to be considered as the founder of a school that is independent, original and gay, which nobody will contest, suggests that he also reflected better than others the French *esprit* and national character. The fate of WATTEAU is the surest evidence that among his contemporaries he was not credited with holding the mirror up to nature or character. His works were strange to the eyes of his countrymen. They were called by French titles, but they did not represent French scenes. Nobody who knows anything about the days of the Regency would venture to employ WATTEAU's charming scenes as illustrations of the manner in which life was enjoyed in the beginning of the eighteenth century. His *fêtes galantes* are of no age or country, and as Frenchmen unhappily ignore or undervalue all things they cannot claim, WATTEAU's fame has been slowly and grudgingly acknowledged. The painter of youth and beauty, and of a land in which it seems to be always a summer afternoon, has suffered because he made it a rule to avoid local characteristics.

But the absence of what is temporary and restricted has brought about compensation. The most ardent admirers of WATTEAU are probably to be found outside France. That the artist was a Frenchman is not denied, but, as became a man of his genius, he painted for humanity. His subjects are at home in all countries, and hence, as was remarked by THORÉ, England possesses ten times as many of WATTEAU's pictures as are to be discovered in all France. We find from the list attached to M. DARGENTY's book that in Paris there are two collectors of WATTEAU's works, viz. the Barons ALPHONSE and EDMOND DE ROTHSCHILD, while in London there are seven. In fact, so little value has been placed on the artist in France it needs some courage for a Frenchman to write about him, and what is said ought to be inspired by a penitential feeling of humiliation, for the ignorance displayed in connection with WATTEAU's works is discreditable to French connoisseurship.

In the course of his life WATTEAU was made to feel that even in France genius can be treated as if it were valueless. He was born in 1684 at Valenciennes, a town which, as THORÉ observes, is not far from Antwerp, for if WATTEAU owed allegiance to any master it was to RUBENS. Little is known about his family, except the entries afforded by the official registers, and from them it would appear that the father exercised a Wellerian liberty in spelling his name, which is put down as WATIAU, VUATEAU, WATEAU. The last corresponds with the artist's signature, but the world insists that the correct name is WATTEAU. The father of ANTOINE is supposed to have been a "couvreur," and may have used slates, tiles and thatch with like facility. It is open to everyone to assume that he was a poor man, who was eager to have the help of his son in roofing, or that he was a contractor who owned a corner house, but was avaricious, and for the sake of saving preferred to have his son at mechanical labour. Both theories have been proposed, and both rest on assertions. The usual legends are related about WATTEAU's precocity, and how he was able as a child to sketch groups in the market-place. It is probable he did display some power, as he was admitted into the atelier of a local artist named GÉRIN, who must have been forgotten if WATTEAU did not make his acquaintance. How long the two were associated and what was the character of the teaching cannot be discovered. It is believed that the death of the "couvreur" in 1702 brought about a change. According to one account, ANTOINE passed to a second master, most likely the scene-painter of the local theatre, by whom he was brought to Paris to assist in some decoration at the opera-house. On the completion of the work the master returned, and WATTEAU was left alone.

At the time he was stranded in Paris it may be assumed that WATTEAU was about twenty. It is impossible to estimate his competency; still, a young fellow of genius who had worked under a couple of masters must have been able to apply his hands to many kinds of work. It may be conjectured, however, that WATTEAU was diffident and wanting in confidence in himself. When most successful he could not believe that his works were valuable, and it is not going too far to suppose that in his first days in Paris he was not assured of his powers. Otherwise it is odd to find him seeking no better employment than the drudgery of aiding in the production of a class of pictures which served instead of the tawdry lithographs of our days. In one of the shops which stood on the Pont Notre-Dame there was a manufactory of that kind, in which the division of labour was acted on to an extent that would please an economist. Each assistant was allotted a part and a colour. One executed skies, another drapery, and so on; one hand laid on blue, to another white was entrusted, and in that way a dozen could co-operate. WATTEAU must have gone through the course many times, until he knew some of the figures by heart, and could manufacture at least one unaided. His emoluments were in cash three francs weekly and a plate of soup daily. An ordinary young fellow of his age would suffer tortures of many kinds, but it is to be hoped the magic of WATTEAU's imagination could turn his miseries into delights. He endured all stoically, but his delicate constitution could not withstand the strains of hunger, and his early death was no doubt caused by the trials of those days. Yet amidst all his misery he never neglected his studies as an artist. Art became to him a consoler, and made him indifferent about death. When Count CAYLUS, as became a prosperous gentleman, lectured him on his Bohemianism, he replied:—"Let the worst come, there is still the hospital; nobody is rejected from it." Yet this man appeared to be made for depicting scenes of refined pleasure in places where there was constant summer, and it might be inferred from his paintings that he lived the life of a sybarite. His case proves that what GOLDSMITH says of poets may be taken as applicable to painters—that is, if a man well fed can paint tolerably, after a course of starvation he will paint like a demigod.

The obscure and painful toil of WATTEAU came to an end. He was employed as assistant by GILLOT, a painter who, after trying bacchanalian, historical and sundry other subjects, was then tempting patrons by turning out Italian comedy-scenes. It was the opening of a new world for WATTEAU, and one that was in a way complete, for the characters were defined. He too, in course of time, presented harlequinades; but, after his manner, he also transfigured the actors, and placed them as inhabitants of the most charming of Arcadias. All went well with GILLOT and WATTEAU for a time, but it was the fate of the latter to be tossed about. The two friends separated, and, as

* *Les Artistes Célèbres: Antoine Watteau.* Par G. Dargenty. Paris: Librairie de l'Art.

happens with most events in Watteau's life, the cause remains unknown. The rupture is said to be due to the jealousy of Gillot, but that sort of charge is stereotyped in such cases.

Watteau was next taken in hand by Claude Audran, who, after decorating part of the Luxembourg, was made concierge at the building. The young artist was utilised in painting ornament, and, as Audran quickly perceived his value, he was well treated. Watteau was allowed time for study. He was enabled to copy pictures by Rubens, from which he derived inspiration, and in the gardens of the Luxembourg he found noble trees and delightful vistas. After so many trials Watteau was blessed with peace, and his association with Audran was probably the happiest time of his life. His aspirations were modest, and the Luxembourg must have appeared as an enchanted palace in his eyes. But there was to be no stability for him in any place. He painted a military scene in some of his spare hours, and submitted it to Audran. The ornamentist knew well that ordinary figure-pieces require a sort of skill that does not improve the style required in decoration, which should be more or less severe. He advised his assistant against continuing his experiments in easel-work. But Watteau concluded that he was being made a victim of selfishness, and, on the plea that he wished to visit Valenciennes, he gave up Audran's work. It is possible that Audran was thinking of his own interests in counselling his friend, and writers who treat of the case are opposed to his tactics. But it should be remembered that Audran was an ornamentist and judged as one, while, on the other hand, Watteau had not displayed skill unless as an assistant, and his most important work was putting in figures in connection with Audran's ornament. We have not Watteau's version of the story to guide us, but it is not unlikely that when he found there was no more for him to learn under a master he was eager to depart. He sold his picture for sixty francs, and with the aid of the money, the largest sum he possessed up to that period, he went to Valenciennes. There he painted a companion for which he was paid 100 francs. Unlike his later works the two are full of figures on a small scale. Watteau was not long in discovering that he was out of place in the northern town. He could not overcome his restlessness, and so he returned to his Paris garret as suddenly as he had withdrawn from it.

A new experience awaited him. There was a rich amateur in Paris named Crozat, who was possessed of many valuable pictures and studies. He had heard of Watteau and offered him board and residence in his mansion. The offer was accepted, and the collection was studied by Watteau with the eagerness of a man who knew that his opportunity was of brief duration. It was before Crozat's pictures that he acquired the style which gave value to his slightest work. When he derived from them the power he sought he naturally wished to exercise it, and as that was impossible under his patron's roof he resolved to retire. He completed the decorative work he had undertaken and then departed. Whether there were other causes cannot be discovered. Patronage can become oppressive, and the eloquence of amateurs is too often a punishment to the auditor. Watteau may have endured both and considered that liberty and poverty were preferable.

He is next heard of as a candidate for the Academy studentship in Rome. The subject for the year was biblical, and the strange notion came to Watteau to submit the two small pictures mentioned above instead of the prescribed work. They were left in the Academicians' room, and there attracted unexpected attention. Watteau was sent for, and to his surprise was informed by Delafosse, one of the painters, that the works demonstrated that he was qualified to be an Academician rather than a student, and if he complied with the requisite formalities he would be elected. In a brief time he became an Academician, and since the institution was founded no such election had taken place.

M. Dargenty and others consider there was something providential in Watteau's escape from the Roman school. There, it is supposed, he would have lost his natural gifts and become a nonentity, like so many who have tried to be a Michel Angelo without having a giant's powers. It seems to us that such a conclusion can only be made in forgetfulness of Watteau's character. He was no imitator, for he possessed the faculty to transform his models. The Kermesses of Rubens, which are full of animalism (unlike the scenes that still pass under the name and which are more doleful than funerals) became in Watteau's hand most refined scenes, such as we might imagine took place on the sward of lawns and opening glades of some princess's academy in the intervals of discussion on "all that treats of whatsoever is." The Italian buffoons which he aided Gillot to depict were converted into as fine gentlemen as could be found about a court. The Luxembourg trees grew to woods at his command, and the gutters of Paris were turned into crystal streams. A comparison of Watteau's drawings, in which it was requisite to be exact, with the painter's finished works, will reveal the power of his idealising process. It was no doubt from a study of Watteau's feats in converting the prose of life into poetry that Louis Viardot was induced to regret "that the artist did not consecrate his talents *de plus hauts sujets*," and there is an unworldliness in his paintings which is only to be found in the scripture pieces of the great masters. If, in a word, Watteau could draw from Rubens qualities which would not be generally ascribed to that painter, might he not be as successful with Rubens's inspirer, Michel Angelo? There is, however, some excuse for the French critics. Every year they see most promising students wrecked after a voyage to Rome, and it is not blameable if they believe that a genius like Watteau would not be proof against the dangers of the official system.

His election to the Academy at once convinced people that Watteau was possessed of extraordinary ability. Urgent requests were made for his pictures and his society was sought. But there was no change in the artist. His youth seemed to have passed away during his slavery in the booth on the Pont Notre-Dame, and he looked on himself as a man who was in reality only worth three francs a week. Perhaps, too, his mind was clouded by the apprehension of an early death. He acted as if he had no right to rest. He tried the experiment of living with various friends, but everywhere the impulse of flight came upon him, and it was irresistible, as it is still with others. He crossed over to England in 1720, but failed to settle down among us, and he returned to Paris the next year with an aggravation of his lung disease. It is said, too, that he brought with him a love of money which hitherto was indifferent to him, but as he died on July 18, 1721, it is not plain how he could have displayed any signs of avarice.

The paintings of Watteau are the productions of an invalid, and we may presume that they express his aspirations after modes of enjoyment to which he was a stranger. Looked at in that way they become the saddest of works. The lonely, unquiet, consumptive artist longed to have warmth, sunshine, repose, the company of friends, music and song, and his pictures are more expressive of his needs than the most eloquent poetry. Whatever he might appear to his friends, in spirit he was the gentle stoic who could look on the hospital and the grave without fear. He would not leave the world without endowing it with visions of beauty which are worthy to be set beside the great works of Titian. He made no tragedy out of his own sufferings, but like some pitying angel suggested a time when, if men would come to be in harmony with nature, the world would be again a Paradise. Anacharsis Clootz himself could not in his dreams of universal love a few years later surpass the scenes of happiness, which came from the blanched hand of Watteau, but which are unfortunately as far as ever from realisation off the stage.

The parts of the series "Artistes Célèbres" are abundantly illustrated, but in M. Dargenty's book the plates are more numerous than in any of its predecessors. Many are taken from rare drawings by Watteau, which are produced in excellent style.

THE ROYAL SCOTTISH ACADEMY.

THE sixty-fourth annual report of the Council of the Royal Scottish Academy runs as follows:—The sixty-fifth exhibition was opened on Saturday, February 14, and was closed on Saturday, May 23. It contained 773 paintings in oil and water-colour, 41 works in sculpture, 32 architectural drawings and a number of etchings. The annual dinner took place in the Galleries as usual on the eve of the public opening of the

exhibition, when the President and Council had the pleasure of receiving a large and distinguished company. The vacancies in the rank of Academicians will require to be filled up at the general assembly of the Academy in January, and in March next the Academy will be called upon to elect associates to the number which may be determined by the general assembly of Academicians.

Librarian's Report.

The following is the report of the librarian and the curators of the library :—"The books, prints and drawings are in good order and catalogued up to date. The aggregate attendance of members has been fully maintained, but that of the students has considerably fallen off. Besides the addition of the leading British and French art periodicals and the Arundel Society publications for the past year, the following works have been added to the library :—Retzsch's 'Outlines to Shakespeare,' original edition. First series, 'Hamlet,' seventeen plates, folio, 1828; second series, 'Macbeth,' folio, 1833; third series, 'Romeo and Juliet,' thirteen plates, folio, 1836; fourth series, 'King Lear,' thirteen plates, folio, 1838; fifth series, 'The Tempest,' thirteen plates, oblong folio, 1841—presented by John Hutchison, R.S.A. 'Croquis Militaires,' par A. de Neuville, twenty plates, large folio—presented by Otto Leyde, R.S.A. (Signed) Otto Leyde, librarian; William Hole, curator; Robert M'Gregor, curator."

Life School.

The visitors of the Life School report as follows :—"The session of 1890-91 commenced on November 3 and ended on June 27, 1890, having had 124 morning and 125 evening meetings. The aggregate morning attendance was 1,622, and the aggregate evening attendance 1,550, giving an average attendance at each meeting of 13 in the morning and 12 in the evening. During the session 10 students retired and 6 were admitted. Notwithstanding the large number of senior students who retired in accordance with the rules, the school continues to show satisfactory progress and vitality. The work of the students is now submitted to the Council, and the Visitors have nothing further to add except to express their satisfaction with the general conduct of the students during the session. (Signed) J. Lawton Wingate, visitor; R. M'Gregor, visitor; D. W. Stevenson, visitor; William Hole, visitor." The Council are pleased to recognise the marked ability shown in many of the studies in oil, but they would call attention to the necessity for greater thoroughness and delicacy of perception of form in the drawings. Further, they regret that they have again had to withhold the Stuart prize, partly on the same grounds given last year, viz. that in the special qualities desiderated—composition and design—the competitors are sadly deficient, and also on account of excessive carelessness in the delineation of the figure. After a careful examination of the studies, the Council awarded the prizes as follows :—The Chalmers Bursary, Alex. Coutts Fraser; extra prize for painting, James Riddel; the Chalmers-Jervise Prize for the best drawing from the life, P. P. Mackie; Maclaine-Watters Medal, James Riddel; the Keith Prize for the best work by a student in this year's exhibition, John C. Mitchell and David M. Smith, equal. Mr. J. Mitchell and Mr. G. Shand receive honourable mention for merit in painting, and Mr. A. C. Fraser for drawing. The Council have to report that, in accordance with the resolution of the general meeting of February 25 last, Mr. Hole, R.S.A., delivered a short series of lectures on Pictorial Composition to the students of the Life School and others, which were well attended.

Donations, Bequests, &c.

The Council report that the munificent bequest made to the Academy by the late James Nasmyth, of Hammerfield, Penshurst, Kent, to form a fund, to be named the Alexander Nasmyth Fund, for the benefit of decayed Scottish artists, has partly, in terms of the will, been paid to the Academy, and, in accordance with laws framed for its administration, relief has been afforded to a number of applicants. The Council have also to report the presentation to the Academy by Mr. James Orrock, R.I., London, of a number of interesting and valuable water-colour drawings illustrating the rise and progress of the art in England. The drawings, fifteen in number, include examples of P. de Wint, David Cox, William Hunt, Bonnington, Cattermole and others. The Council have further to acknowledge the gift to the Academy by Sir J. D. Linton, P.R.I., of three of the original sketches in oil by William Etty, R.A., for his great work, *Judith and Holofernes*, belonging to the Academy, and now in the National Gallery of Scotland. Along with these sketches Sir J. D. Linton also presented a copy by William Etty, R.A., of a figure in one of the pictures of the Marie de Medici series by Rubens, now in the Louvre, Paris.

Deceased Members.

The Council regret having to record the breaks which death has made in the ranks of the Academy during the past year. One honorary member, Mr. W. Bell Scott; one associate, Mr. Keeley Halswelle; and three Academicians, Mr. John Dick Peddie, Sir William Fettes Douglas, the president, and Sir John Steell having died since the general meeting in November last. Short obituary notices of these gentlemen are given in the report.

The New President.

Pursuant to the resolution of the Academy, a general meeting was held on August 8 to elect a successor to Sir William Fettes Douglas, and Mr. George Reid, R.S.A., was unanimously elected president of the Academy; and, as in previous cases, the secretary, in acknowledging the receipt of Her Majesty's gracious reply to the intimation of the death of Sir William Fettes Douglas, communicated the election of Mr. Reid as his successor.

The Academy's Schools.

It has long been felt by the members of the Academy that the arrangements of the Treasury minute of 1858 have limited the action of the Academy in regard to teaching. This may not, however, have been known by the general public, and it is with great satisfaction that the Council notice the decision of the Secretary for Scotland, just received, annulling the above arrangements and granting to the Academy greater freedom in the management of its school.

The New Charter.

It is with great pleasure that the Council, before closing this report, refer to the granting by Her Majesty of the supplementary charter of the Academy which has for some time been under consideration by the Privy Council, and would express the hope that as under the new charter many hampering conditions have been removed, a liberal interpretation of its provisions may be given by the Academy, so that not only the Academy itself and the artistic profession generally but art in Scotland may receive a fresh impetus, and continue to advance in even a greater degree than it has done in the past.

Office-bearers.

Office-bearers were elected and the Council declared for the ensuing year, as follows :—Council : George Reid (president), W. D. M'Kay, John Hutchison (succeeded the late J. Dick Peddie in terms of the laws), J. B. M'Donald, W. Beattie-Brown, John Smart, J. Lawton Wingate, George Hay (secretary) and John Hutchison (treasurer); W. D. M'Kay and W. Beattie-Brown, auditors; Otto T. Leyde, librarian; John Hutchison and John Smart, curators of library; D. W. Stevenson, William Hole, Robert M'Gregor and Robert Alexander, visitors of life school; Clark Stanton, curator of life school.

[It may be explained that under the Treasury minute of February 25, 1858, an arrangement was made that the classes for the antique should be under the charge of the Board of Manufactures, and that the life school should be under the control of the Royal Scottish Academy, and that neither, in these respects, should trench on the profits of the other. This has now been abolished. The Board of Manufactures have recently opened a life class, and the Royal Scottish Academy will now be at liberty to have classes for their own students for the study of the antique.]

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening, Mr. J. MacVicar Anderson, president, in the chair. At the conclusion of the business meeting at 8.40, a paper was read by Mr. H. Favarger :—

The Building of "Mena House."

Mr. FAVARGER, in his introductory remarks, referred to the common belief that there were only two or three Pyramids in Egypt, whereas about forty were now visible. When the Suez Canal was opened the Khedive Ismail had a road made to the Pyramids of Gizeh and two houses built, one on each side of the road. The one on the lower ground, to the north of the monument, was sold by the present Khedive, and, being eventually purchased by an English capitalist, formed the central point round which had been grouped the various buildings forming the hotel known as "Mena House."

Towards the end of 1888 Mr. Favarger was commissioned to add a dining-room and more bedrooms, and in May 1889 some fifty other bedrooms and reception-rooms were to be added. Plans were prepared and tenders invited from contractors in Cairo for the small amount of work first decided upon, but the prices seemed so high that it was determined to engage native workmen and make them work under supervision. A young Swiss who had had some experience of building in Egypt was engaged as clerk of the works, and the work commenced. The stone for the rubble-masonry walls was taken from a large unfinished building which was built of stone and mud. The larger work in the following spring necessitated the collection of a stock of stone, and permission was obtained to use the *débris* of stone around the Pyramids. Erroneous state-

ments had been made that the Pyramids were being stripped of their casing to enable the hotel to be built, and the author took the opportunity to explain the actual facts. The Museum authorities, under whose control all the old Egyptian monuments were, refused to allow a single workman near the Pyramids, but employed their own men to clear away the rubble from certain points that interested them, and after it had been searched for inscriptions certain portions were allowed to be taken away, an arrangement which gave absolute security that the monuments would not be injured. When making the greater additions to the house it was decided that they should be at right angles to the old building, and their southern face become the main frontage. A carriage-drive from the road led to the main steps, and passing through a large wooden verandah the visitor reached the entrance leading into an antechamber and then to the hall, with the staircase some distance off. The drawing-rooms faced east and the library south, while westward was the staircase, placed so as to serve, with its alternate landings, the several floors, first to the east and then to the west. The billiard-room was built outside the house, top-lighted, and connected with the card-room by arches in the main wall. Moule's earth-closets were used, but in a separate block from the house, approached on each floor by a roofed bridge opening out of the lavatories. The bedrooms were divided into tiers of three, each tier being half a flight higher than its neighbour, with the English single-leaf door instead of the French double door. The foundations of the building gave little difficulty, the dry sand of the desert forming a basis almost equal to solid rock. The elevation was simple, and the labour being only Arab, rubble ashlar, unplastered, was selected, as being the nearest to the usual native style of work. While these works were in progress stables were erected on the opposite side of the Cairo road, which could accommodate over one hundred and fifty animals, and a large open-air swimming-bath and a steam laundry were constructed. A matter of serious importance also claimed attention, namely, the water-supply. After careful consideration and three boring trials, which were described by the author, the fact was proved that water could be found on the edge of the desert in large quantities and of great purity. It was found, however, that if an abundant supply of water was to be depended upon a well was absolutely necessary; and a design was prepared, which consisted of a 13-inch brick wall, built on a circular iron curb of 8 feet internal and 10 feet external diameter. The author described the construction of the well in detail, and a daily record of the work was given.

In 1890 further additions were decided on; among them a house to serve as an estate office, and eventually as an annexe to the hotel. This was built of sun-dried bricks, such as used by the natives in the construction of their huts, and consisted of six rooms on the ground-floor, with eight bedrooms and offices above. A secure foundation of rubble masonry was carried up 3 feet above the ground, to secure the base from injury by surface-water, and on that were built the walls of the first storey, to the thickness of nearly 3 feet. The settlement of the house was considerable, but so even that the only harm was that the plastering of the wall came down, and had to be replaced when the walls were thoroughly dry. In the design of the dining-hall the eastern Saracenic architecture was adapted to modern requirements. The hall was to be a feature of attraction, and, while providing with comfort for about 100 persons, was to be capable of accommodating 250 persons. Two levels, therefore, were given to the room, the main room having a raised corridor round it, similar to the Holborn Restaurant, which gave great scope for the introduction of arches. The four principal arches of the main room formed the special feature of the hall. The south arch was a copy of the principal arch in the beautiful mosque of Kait Bey; the northern arch differed somewhat, although its leading dimensions were identical. Other details of the hall were then given by the author, who proceeded also to describe the vestibule and the roofs, and then turned to the various styles of building in Egypt. Firstly, the mud buildings, which were constructed of mud bricks dried in the sun, the binding material being also mud. The work was done with as little moisture as possible, and made a warm, comfortable house, and the settlement, though considerable, was even. Secondly, stone and mud building, which was a favourite method with the Arabs in districts where fuel for making lime was not easily to be obtained; and it was surprising how long such buildings lasted in Egypt. Thirdly, rubble-ashlar buildings of stone and lime, with courses of bricks every 2 feet, to give a fresh level to the work, and equalise the pressure on the walls. Having dealt with the qualities of limestones, lime, sand, timber and other materials to be obtained in Egypt, Mr. Favarger turned to the question of labour. The workmen were almost entirely Arabs, directed by European foremen, and he remarked that it was curious, although Greek, Italian, Maltese, Turkish, French and German artisans were employed, not a single English craftsman offered his services during the building at Mena House. Among the Arabs a few clever and intelligent masons and carpenters were to be met with, but the majority were indolent and ignorant, and difficult to deal with. For rough labour the Arab was not unsuitable, properly supervised. The children, both girls and boys, were extremely quick and strong. Of plumbers there was a sad lack, and the Maltese who did the work had almost to be taught how to use his tools. Blacksmiths and engineers were fairly intelligent, and were generally Italians or Germans. That good work could be done, however, was evident by Mena House being an accomplished fact, but it was hardly credible the amount of supervision which was necessary. The whole building ought to be considered as the result of a race against time, varied by a scrimmage with constant difficulties, rather than the embodiment of carefully-digested plans; and the hearty co-operation of those connected with the building operations contributed in no small measure to the final result.

Mr. R. Phené Spiers, F.S.A., proposed a vote of thanks to Mr. Favarger for his paper. He said he was not acquainted with the modern work done in Egypt. Those who heard this paper, and who had heard the paper read to them two years ago, would, he thought, have perceived a similarity with much that Mr. Favarger had told them. In regard of scaffolding, the use of inclined planes of planks instead of ladders struck him forcibly in connection with the construction of the Pyramids, where ten years were expended in making a causeway to roll up material. Most likely the enormous masses were handled in a very simple way by aid of inclined planes. It was a singular fact, as mentioned by Mr. Favarger, that the railway was not at all in accordance with the customs of the inhabitants. He remembered the astonishing work of boys and girls employed in carrying material for the railway, and how rapidly the mounds of material grew. A point also that struck him particularly was the beauty of the brick arches above stonework. He would like to know the size of the bricks used. In conclusion, he thought there was no better way of illustrating a paper than by use of lantern and slides, as Mr. Favarger had done.

Mr. Thomas Henry seconded the vote. Alluding to a climate where the temperature was between 90° and 100°, he said the comforts at the Mena Hotel could hardly be understood unless experienced. In Cairo it was hardly possible to have any appetite. Sitting down in the sumptuous dining-hall at Mena restored the appetite. Sleep was insured, and he would return to Cairo thoroughly refreshed. He had never been in a more beautiful dining-hall or a building more suited to the circumstances of the country in which it was built. He did not know any hotel in tropical parts so admirably suited for its purposes. Every comfort was provided, and also amusement, shops, tennis-grounds, racecourse, &c., and a capital stud of horses.

The President had not examined the plans, so as to speak of the planning of the building. Of the architecture, as shown by the slides, it was difficult to speak, because the buildings did not appear to possess much architecture. Great simplicity had to be attended to, and Mr. Favarger had succeeded in attaining that result. The President then put the vote, and it was carried by acclamation.

Mr. Favarger, in reply, said the Arabs always preferred manual labour to wheels for carrying material. The bricks were smaller than English bricks, the approximate size being 2 by 4 by 6. Mud bricks were 3 by 5½ by 10. Some mud bricks were even four times that size, but they were really blocks rather than bricks.

The meeting then adjourned.

TESSERÆ.

Ancient and Modern Sculpture.

In some important respects there is now no common catholic standard whereby the various modern schools of sculpture can be gauged. Broadly stated, of course nature should be this standard, but all who have studied art and know its requirements are sensible of the importance of considering how far, or rather under what aspect, nature is to be the artist's guide, a remark that applies especially to sculpture. In the history of art the function of the highest class of sculpture known to us was to interest and incite the loftier feelings of those to whom it was addressed by representing sublime and noble subjects under the most perfect forms. It is admitted by all competent judges that this union or combination of the most elevated motive with the most perfect physical beauty as its exponent has been thoroughly achieved by one people only, the Greeks, and it is on their best sculpture, in which these two elements are found combined, that all sound criticism on this art has been based. This is not to place Greek or any other art before or in antagonism with nature. Art is nature seen through the medium of mind and refined taste.

Mezzotint Engraving.

The generally received opinion as to Prince Rupert being the inventor of the mezzotint engraving is erroneous. It appears that the person to whom the merit of the invention is

due is Louis von Siegen (or L. à Siegen), a lieutenant-colonel in the service of the Landgrave of Hesse-Cassel. The works of this amateur artist are of considerable rarity, and it is not improbable that they were merely distributed among his friends and patrons. Baron Heineken, in his "Idée Générale d'une Collection complette d'Estampes," printed at Leipsic in 1771, says decidedly that Siegen was the inventor of mezzotint engraving, and observes that the first specimen which appeared was the portrait of the Princess Amelia, Landgravine of Hesse; he adds that Prince Rupert learnt the art from Siegen, and that eventually it became public. In Grainger's "Biographical History of England" we find the following observations on the invention of this style of engraving:—"It should not be forgotten that Sir Christopher Wren is said to have been the inventor of mezzotint. It is certain there is a blackamoor's head by him in a different manner to that of Prince Rupert; also Vertue, in a manuscript in my possession, mentions a large head, something like mezzotint, of the Princess Amelia of Hesse thus inscribed:—'Ad vivum à se primùm depictam, novoque jam sculpturæ modo expressam, dicat consecratque L. à S. anno 1643.' Mr. Wanley says there is one of this lady in Lord Harley's collection of heads, also one of the Comes of Hesse by the same hand, who was the person who taught Prince Rupert." Mr. Lodge, in his life of that Prince contained in his "Portraits of Illustrious Persons," after mentioning the Prince's contributions to science and various discoveries, says:—"But the discovery which we find most frequently associated with his name is of the art of engraving in mezzotint, the first hint of which is said to have occurred to him from observing the effect accidentally produced by a soldier scraping some rust off the barrel of his musket. His right, however, to the strict reputation of inventor has been somewhat questioned, but with little probability." It will be seen by this that Heineken's authority is doubted; but Mr. Strutt, in his "Biographical Dictionary of Engravers," although more cautious, is nevertheless in doubt on the subject, for he says, after noticing the story of Prince Rupert's observing the soldier scrape the rust from his musket:—"If the account, as given by Baron Heineken, be allowed as authentic, and it bears every appearance of being true, especially if such a portrait really exists, then the probability of the first story is entirely destroyed. I must leave the reader, however, to decide, having given him all the information I could obtain on the subject." Huber, the compiler of Winckler's Catalogue, tells us that Theodore Caspar de Fürstenbergh, a capitulary canon of Mayence, was an engraver in mezzotint; that his works are cotemporary with those of Siegen, and expresses a doubt as to which was the disciple of the other, adding if Fürstenbergh learnt the art of Siegen he excelled his master. But there is no evidence whatever to warrant this doubt; on the contrary, a mezzotint portrait of the Queen of Bohemia bears the date of 1643, whilst the earliest known specimen of Fürstenbergh is dated 1656. It is only necessary to add that Rupert's earliest effort in mezzotint (though etchings of this Prince are earlier, and one is known inscribed "Rup. Pr. 1637") is of the year 1658.

Chinese Houses.

In building a Chinese house of the common sort there are no extensive lines of foundations to be laid, such as are formed for building European houses. A course or two of bricks about a foot and a half square is first laid; on this a square tile is placed to support a round stone of sufficient width to correspond with the thickness of the timber used, and to serve as a base for the support of the upright pillars of the framework, and to keep the wood from contact with the damp earth. There is often no attempt at concealing these beams by masonry in building up the intervals between the parts, so as to form side walls or partitions; on the contrary, the exposed pillars are so numerous that they present a striking feature in the interior of Chinese houses. The side walls are built up very expeditiously by laying a single course of bricks, or by arranging the brickwork in the form of a hollow wall; in the latter instances flat bricks are used and bonded accordingly. This mode is generally adopted in forming the outer walls of buildings or of courtyards, consequently they are hollow and wanting in strength. The former method is employed in making partition, and corresponds with our Flemish bonding. The partition is strengthened considerably by a layer of lime mortar, mixed with coarse fibres of a paper made for this special purpose, and prepared from the fibres of the jute, bamboo, and other coarse fibre-producing plants. This paper is torn up into small pieces and thrown into the fresh slaked lime, and thoroughly mixed, so as to become a sort of pulp. From this it is readily seen how few bricks are required to build a Chinese house, and with what celerity it may be constructed. The upright pillars of the framework support the horizontal connecting beams; on these rafters are laid, so close as to sustain a layer of flat tiles. Over these a course of curved tiles are laid, after the fashion of ordinary tile-roofing in Europe. In the central and southern parts of China no ceilings are used, so that there is plenty of natural ventilation. This renders the house very cold in winter. Leakage is very liable to occur, and the flat tiles often fall, and sometimes do severe injury. The more northern houses are more comfortable, and better adapted to a cold climate; they have ceilings of paper, and the roof is laid on a thick layer of reeds. The roofs of Chinese houses are always completed before the side walls are commenced, and thus present a most anomalous appearance while being constructed. They generally project over the side walls, so as to form a verandah or eave to shade from the sun, or to throw off the rain from the walls more effectually. In such cases the outlines of the roof present a graceful curve; and a curved line being often found in the outline of the upper ridge of the roof, which is generally terminated at each of its extremities by ornamental projections, no doubt gave rise to the supposition that the Chinese derived the design of their houses from the form of a tent; but a little examination will show that the curve or dip in the roof, not always present, is mainly due to accident in forming the framework of the roof, and to a matter of taste in ornament, the object being to hide the monotonous straight line the ridge of the roof would otherwise present, its presence being unconnected with the plan of the structure. The form of the gourd is sometimes observed to surmount the pinnacle of a high central roof in a group of buildings; it is an emblematic form, and indicates longevity. The old story of the elixir vitæ being kept in one of these gourd bottles has some bearing on this point.

Italian Majolica.

The principles upon which this manufacture is based consist in painting with metallic colours upon a biscuit, which, being naturally coloured, is, first of all, whitened by means of a thin layer of a hard stanniferous preparation; then, after the completion of the painting, it receives a thin smear of transparent glaze, so that the painting is placed between two layers of vitreous composition, the stanniferous preparation being the harder of the two. The degree of heat necessary to vitrify the whole has to be regulated with the greatest care, because if too low the painting will appear hard, dry and deficient in richness of tone; if too high, the colours lose their strength and brilliancy. The point to be attained is when, without losing their force, the colours are sufficiently fused to blend slightly one into the other, and remove all hardness of outline. As this process requires so much manipulative skill and tact, the natural endeavour amongst manufacturers was, as soon as they were acquainted with a way of making an enamel at once opaque and soft, to coat their biscuit with this single preparation, and so realise their aim to a nearer approach to porcelain. But then this occurs, that in increasing the opacity of the enamel the richness and vigour of the colouring are lost. It is only necessary to compare a piece of early majolica, of Faenza more especially, with those of a later period, to be convinced of this; it will be at once apparent that the richness of the tints is in inverse proportion to the amount of tin mixed in the enamel, or, in other words, to the opacity. Hence a reason why from the second part of the seventeenth century the Italian majolica-ware was already but a pale reflection of its predecessors, that in Holland they should produce what we call delft-ware, and more especially faïence in France.

St. Mary's Church, Guildford.

St. Mary's Church is an ancient building, the architecture of which is a compound of the Norman and Pointed styles; the former predominant in the detail and ornaments, the latter in the arches and windows of the structure. It consists of a nave and aisles, and a chancel, separated from the nave by a tower, and flanked by two chapels, so that the church may be described as in two portions: the whole of the eastern part, comprising the chancel and chapels, is raised above the other portion, in consequence of the church being erected upon the slope of a hill. The chapels are likewise each composed of two portions answering to nave and chancel, the latter being semicircular in plan, and separated from the former by an arch. The southern chapel still contains a screen of oak, which formerly constituted the back of the altar; it retains traces of colour, and a portion of the carving, and is now improperly termed a confessional. The northern chapel has its chancel, a semicircular portion vaulted in three divisions; the ribs are stone, and the spandrils probably chalk. On the face of the vaulting, and on the spandrils of the arch which divides this portion of the chapel from its nave, are depicted the subjects here described. The seven subjects first described are depicted upon the soffit of the vault. An oval compartment in the centre bears a representation of the Godhead seated; his right hand raised in the attitude of benediction, the left sustaining a book or table, inscribed with the letters Alpha and Omega. The remaining subjects are upon the spaces intervening between the ribs of the vault, and occur in the following order, beginning from the south side:—1. Represents Christ passing Judgment. Before him a pardoned man kneeling in prayer, behind whom are two others dragged to judgment by demons. 2. A figure of Christ, before whom is a person placed within a font in a supplicating posture; a third

figure is represented drawing water from a river by two buckets. 3. Earthly Judgment, represented in a group of five figures. A king seated, the accuser and witness standing, and a culprit suffering decapitation. 4. Heavenly Judgment. Several good souls represented as received into the bosom of our Saviour; a bad man condemned to torment, which he is suffering in a tub-like receptacle from a figure armed with a flesh-hook. 5. The Death of the Wicked. A judge standing, holding a wand or rod; a scribe seated at a desk registering the sentence. Two figures extended dead upon the floor; a third drinking from a chalice. 6. The Death of the Good. The least defaced of all the subjects. It represents a corpse placed upon the ground attended by two priests; in the background an altar, upon which is placed a chalice; above, the hand of Providence issuing from the clouds. These six subjects are in circular compartments, the remainder of the soffit being filled with ornamental foliage, and two angels with censers, so placed as to appear on each side of the figure of the Deity first described. In the spandril to the right hand of the altar an angel is represented weighing in scales the good and evil actions of a soul, the body belonging to which is represented below in a supplicating posture, the enemy of mankind placing his foot upon the evil scale. The corresponding spandril, considerably defaced, exhibits the departure of the damned, who are dragged away by demons, and driven by an angel with a sword. These subjects are on the face of the wall immediately over the opening to the semicircular chancel, and consequently face the nave of the chapel. The ribs of the vault and the architrave of the arch are painted in various patterns. Mr. Carlos considers these paintings as belonging to the close of the twelfth century, and that they are coeval with the structure which contains them. The existence of these paintings, he observes, is not even noticed in any work relating to the history either of the county or town. It is probable that the whole had been, at some time, covered with a coat of whitewash which concealed them from observation, which may account for the omission. It is not known, he adds, to what saint either of the chapels was dedicated; but it appears that two guilds or fraternities existed here in the fifteenth century, one of which was the fraternity of Jesus, the other that of Corpus Christi, and there was also a chapel of St. John in some part of the present church.

Burgos Cathedral.

The cathedral of Burgos taken as a whole, interior and exterior, has been considered one of the finest examples of Gothic architecture in the world. It is not surpassed by the cathedrals of France and England, though it has the fault of Spanish cathedrals of the nave being too blocked up by the coro, and the capella major, or great altar, too encumbered with chapels, making the interior somewhat heavy. Over the crucero, the intersection of the nave and transept, is an octagonal tower or cimborio, of surpassing beauty and of interest as a rare example of the passage of the Gothic to the Renaissance, which for the most part is decided, presenting scarcely any instances of the mingling of these apparently incompatible styles. There can be no question that it is of much earlier date than that given in the account of the cathedral, 1560. It is believed to be a work of the end of the reigns of Ferdinand and Isabella; it is certainly not later than the earliest part of the sixteenth century. The western façade of Burgos Cathedral, surmounted by its two pyramidal spires of open tracery, dating from 1442, is of great celebrity. But as for the interior the cathedral of Seville is the finest Gothic construction in Spain. It is one of the later cathedrals—date 1400—which renders it the more singular that its author should be utterly unknown. It is a favourite theme with the Spanish pseudo-poets to address lines to the mystic hands that raised this solemn fane, upon which they look with an awe somewhat akin to that of the wanderers in the desert on the mighty remains of Persepolis or Baalbec. This magnificent structure has five naves of nearly equal breadth. The form approaches a square, the breadth being very great in proportion to the length, and the side aisles are all equal and nearly of the same height as the centre. The capitals of the columns are of the same elevation throughout and the piers of similar dimensions to each other. It has thus that element of symmetry which is characteristic of Grecian architecture and in which the Gothic is generally considered as wanting. From this plan and the great solidity of the piers the exterior is wholly without the connecting arches and buttresses, which in most of our cathedrals support the inner parts of the fabric and supply the want of internal strength. The trascoro has a beautiful and costly architectural front of red marble of Moron. It is, however, out of keeping with the architecture of the cathedral. With the exception of the great western porch, which is fine and in keeping, the exterior of the cathedral is singularly unfortunate. It is an inextricable jumble of forms, which can scarcely be referred to any style, or it includes all styles—the beautiful tower of the Giralda representing the Moorish—and is the more remarkable as the accompaniment of the finest interior in existence. In the clerestory there are the most brilliant and finest specimens of painted glass, admirable in itself and its mode of introduction, adding greatly to the marvellous effect of this matchless cathedral.

Canons of Sculpture.

In the best ancient schools there were certain laws to which artists were obliged to conform, and in many particulars even the "treatment" of the sculpture was confined within prescribed limits. First, from the most archaic period down to the perfection of the art in the fifth century B.C. the subjects and motive of sculpture in all nations were regulated by strict religious influences. The dignity of art was preserved, and no opportunity permitted for the introduction of any element of vulgarity or of commonplace. And, secondly, when at the date referred to sculpture had reached its highest excellence the great principle was established that the conceptions of the sculptor should, as a rule, have their outward expression in the most perfect physical forms, a noble and profoundly philosophical idea that the good in sentiment should have its expression in the beautiful. These forms would of course vary according to the fitness of the particular type to express the idea or thing signified, and yet each and all might still be of the very highest beauty, nature in her normal and most perfect aspect being taken as the true standard of imitation. Thus, for instance, the appropriate representation of a *Mercury* or a *Hercules* would both be sought for in the utmost perfection of the human form, while yet the forms themselves might, and indeed necessarily would, exhibit a marked difference as to class and character. So in the idea intended to be conveyed in a statue of *Jupiter* or *Apollo*, of a *Mars* or *Cupid*, a *Juno* and a *Venus*, and others of an equally widely contrasted individuality, the forms would be perfect of their kind, although they would differ essentially in character. Judged from so simple a point of view, ancient sculpture is therefore brought within easier conditions for estimating its merits than can be the case when the art is practised under less strict observances, and indeed only according to the fancy or caprice of the sculptor or of the age and people for whom he labours. Sculpture being essentially and wholly an art of form the real question is, whether the forms employed are to be of a high, the highest, type of excellence, or whether, assuming, as some do, that the whole and sole function of art is imitation, these forms may be of a commonplace character as they occur in ordinary circumstances where the normal and original perfection of nature may have suffered deterioration from accidental causes, as labour, climate, sickness, old age or any other disturbance to which humanity is liable.

Fresco Painting.

"Buon fresco," that pictorial process by which the greatest effects of artistic genius have been realised—the stanze of the Vatican and the ceiling of the Sistine Chapel, for instance—has a peculiar property of its own, which eminently distinguishes it from all other methods of painting. It is this, that a fresco is a non-absorbent of light. The fresco ground is composed of certain proportions of lime from which the heating element has been to a great extent washed out) and sand, and this mixture is used by the painter in its moist state. The wet lime, absorbing carbon from the atmosphere, becomes carbonate of lime, and in combination with the sand, produces an impermeable cement, which is formed over the surface of the ground during the day's work, and in which the colour used is incorporated and fixed. A fresco-painter can only proceed with small portions of his work at the same time. A fresco in progress is like a child's dissected map, made up of pieces of all shapes and sizes, which are joined together day by day. The cemented surface has been stated to be sufficiently crystalline to reflect light. But, whether this is so or not, its non-absorbency of light is unquestionable. It will thus be readily understood how eminently fitted fresco-painting is for mural decoration—especially for churches and public buildings, generally imperfectly lighted, and which are positively made lighter by fresco decoration. Where an oil picture would be invisible a fresco is clearly seen. All other processes for wall-painting, such as water-glass and wax, suffer greatly in comparison with real fresco; but, unfortunately, this beautiful material is much affected by climatic influence, as may be seen in the condition of the frescoes in the Palace at Westminster—a condition almost entirely produced by the bad air of that locality, vitiated as it is by exhalations and impurities of all kinds. It is, however, earnestly to be hoped that the rising generation of artists may be encouraged to try the effect of this beautiful material in places where, with proper care and attention, it might be proof against the humidity of our climate. As in the spandrils of the nave arcade of many a country church you find texts upon the wall to arrest and instruct the wandering eye and mind, so might frescoes be introduced illustrating the great facts of sacred history. Mural painting might with excellent effect be introduced into schoolrooms and the halls and corridors of great houses. It is only in our "flourishing peopled towns," where gaseous impurities hold their sway, that "buon fresco" has but a brief existence.

NOTES AND COMMENTS.

THERE is a chance that archæology will be studied in Oxford with the thoroughness it receives in Germany and France, since it is proposed to create a Central Museum of Art and Archæology in connection with the University. The Ashmolean Museum and University Galleries would form parts of it. The new project is mainly the conception of Mr. C. D. E. FORTNUM, who has done much for the enrichment of the galleries. He proposes, subject to a small life annuity, to hand over at once 10,000*l.* towards the new museum, and at the same time announces that he has bequeathed the rest of his collections, which are of unique value, together with his considerable archæological library, to the University. In return, he asks that the scheme for erecting and adequately endowing the new museum should be carried out at once, and that the whole of the art and archæological collections shall be placed in juxtaposition and under a single governing body. Many other offers of assistance have been received, and apparently there will be no financial difficulties to prevent the completion of the scheme. Of course, much more is contemplated than the building of a museum. The collections will be made useful in imparting new interest to the study of classic authors, which hitherto has been little more than one of words.

FEW visitors to Ecouen are aware that JEHAN BULLANT or JEAN BULLANT, who was charged by ANNE DE MONTMORENCY with the erection of the château and church—a group that has been described as "un précieux joyau de la Renaissance"—was buried in the church which is a memorial of his genius. He was one of the versatile artists of the sixteenth century, and hence he is sometimes described as a sculptor. But his architectural power is evident when it is found that he was associated with PHILIBERT DELORME in the erection of the Tuileries. He died at Ecouen on October 13, 1578. In his will, which was made two days before his death, he describes himself as architect of the buildings of the King and the Queen-mother (HENRI III. and CATHERINE DE MEDICIS). After recommending his soul to GOD, to the Glorious VIRGIN MARY, to "Monsieur SAINT MICHEL-ANGE" and "Monsieur SAINT ACCUEL," his patron, BULLANT ordered that he should be buried in the church before the crucifix. To gain the prayers of "gens de bien" he gave "cinq sous parisis." He also bequeathed to the church of Ecouen in perpetuity a piece of ground in order that a high mass should be celebrated and a requiem and "libera" recited beside his grave for the repose of his soul. His executors were also to carry out his instructions with respect to the bequests to the churches of the neighbourhood for the same purpose. The Château of Ecouen has undergone many transformations. It was seized by LOUIS XIII. and given to the Duchess D'ANGOULÊME. Afterwards it passed to the CONDÉ family. The treasures contained in it were dispersed during the Revolution. NAPOLEON utilised it as a school for the daughters of members of the Legion of Honour. At the Restoration it was again made the property of the CONDÉS. Under NAPOLEON III. it was for a second time converted into a girls' school. So many changes were not likely to lead to the preservation of JEAN BULLANT'S work. The interior has suffered most, but there are parts which he even could still recognise.

THE will of JEAN BULLANT is important, for it shows that the term "architecte" was in use in 1578, and was so well recognised as to be adopted as a designation by a notary in drawing up a will. In the beginning of the sixteenth century the word "architecte" was unknown as a legal term in France. In 1518 GILLES LE BRETON, who had charge of the works at Fontainebleau, was described as "maçon, tailleur de pierre"—that is, mason and stone-cutter. In 1534 there was a reference to certain works by GUILLAUME DE LA RUELLE, "maistre des œuvres de maçonnerie," and "LOUIS POIREAU, maçon juré d'icelui sieur." No less important is the fact that ROBERT ESTIENNE, in his French-Latin dictionary dated 1539, gave as the equivalent for *architectus*, "maistre masson ou charpentier." A change was soon afterwards brought about by the employment of Italians in France. SEBASTIAN SERLIO was invited to Fontainebleau, and appears to have superseded Master GILLES LE BRETON. A warrant of FRANCIS I., dated 1541, authorises the payment of money to "nostre cher et bien amé BASTIANNET SERLIO, paintre et architecteur du pays de Boullongne." That was the first employment of the new term in France. In 1546 HENRY II., writing to PHILIBERT DELORME, described him "nostre amé et féal conseiller et ausmonier ordinaire, notre architecte ordinaire." Once employed, the word was not given up, and the dying BULLANT in 1578 was consequently in a legal sense "architecte" to the King and the King's mother. The change from master of works to architect indicates the variation in practice which was taking place in the sixteenth century. VASARI, who was writing at the time when DELORME was acting as almoner and architect, suggests the extent of it when he said that an architect, in addition to special knowledge, must have had experience in painting or sculpture, or woodwork. The art was passing away from the masons, and was becoming a supplementary calling to painters, sculptors, inlayers, or to men who were ordained as clerics but found their office did not return much profit. The change was not always advantageous, for, according to VASARI, many pretenders were in his day posing as architects because they were acquainted with perspective—in fact, they were draughtsmen who were deficient in the rudiments of construction.

THE system of independent contractors for various trades does not appear to be economical in America. A special committee appointed to report to the Convention of American architects at Chicago, in referring to the extras on account of plastering, say:—"While we recognise the fact that employing plasterers are frequently required to do more patching than can be accurately estimated for, still, the necessity for such patching is largely due to the carelessness or dilatoriness of the mechanics engaged upon the other branches of work in a building, and for this the owner is in no wise responsible, and consequently should not be expected to pay. It would clearly not be good policy, nor would it be just to open so fruitful an opportunity for extra charges against an owner, as the already too great disregard by one mechanic for the work of other mechanics would increase a hundredfold, were it understood that the owner, although not responsible for it, must make good, at his own expense, damage done to any department of work in his building. The experience of master plasterers in previous work ought to enable them, with little trouble or risk, to establish, in making fresh estimates, a margin for possible (but seldom very excessive) loss, under this head. It therefore seems to us that the cost of unusual patching should be paid by those who have made it necessary, and that the employing plasterers should claim recompense from the several mechanics who have caused the unnecessary damage to their work." It would require a remarkably persuasive architect to induce the several incriminated mechanics or their masters to admit such claims. Nor would the plasterers care to have them asserted. Workmen are disposed to look very kindly on those who make "jobs" of the patching class for them.

THE resolve of the French Government to establish a professorship of French architecture in the Ecole des Beaux-Arts, is another instance of the operation of that law of evolution which gives importance to subdivisions. Architecture in general is almost too vast a subject to be taught by one man, and no two professors would correspond in their ideas of the importance of the respective divisions. The points which in one case would be discussed at great length, in others would be passed over. Hence it happens in France that some students have become so inspired by professors with love of Greek architecture, they cannot accept the national Renaissance as more than a debased manner of building. They may be compelled to utilise the more modern style, but it is against their inclination. Now France has a right to be proud of what has been done by the generations of architects who, since the time of the Romans, have flourished in the land. Their work is ample and varied enough for any professor to explain. It is not proposed to abandon the study of Greek or Roman work; but in building, as in language, it is wiser to begin with what is native.

GATES FOR THE VILLA AURELIA, ROME.

THE Villa Aurelia was formerly known as the Villa Savorelli, on the Monte Gianicolo. This villa has been found to have been built upon and had incorporated into its structure a considerable part of the wall of Aurelian: hence the recent change of name. Large outlays have been made by the present owner to adapt it to English uses, and to repair the injuries done to it during the time that Garibaldi, making this villa his headquarters, held Rome for some time against the French. The Roman Municipality altering the approaches to the Public Gardens in this beautiful western part of the ancient city, the entrance to the villa had also to be altered, and the present design for wrought-iron gates was made. Our plate is from a coloured drawing by the hand of the architect, Mr. Thomas Henry Watson, exhibited this year at the Royal Academy.

ARCHITECTURAL ILLUSTRATION SOCIETY. SECOND SERIES.

NOS. 437 AND 438.—DESIGN FOR THE COMPLETION OF THE SOUTH KENSINGTON MUSEUM. [M. MACARTNEY.]

In the description of the church of St. Mary the Virgin, East Grinstead, Mr. W. T. Howdell, architect, an illustration of which appeared last week, it should have been mentioned that the "Climax" Ventilating Company, of 15 Great George Street, Westminster, supplied the roof-ventilator. On referring to the illustration it will be seen that the ventilator is adapted to the style of the church without any loss of efficiency.

THE ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting of the Association took place on Friday evening, Mr. F. T. Baggallay, president, in the chair.

The following gentlemen were elected members :—Messrs. G. W. Curtiss, L. Walmisley, G. H. Manning, W. E. Tower, E. Youart, F. Catlin, J. K. Bateman, J. Allen, F. H. Nowell, R. E. Bennison, A. Wood, M. S. Hack and A. Nicholson.

Donations to the General Fund were announced and the thanks of the meeting awarded to the donors.

Mr. F. R. Farrow was re-elected as vice-president by acclamation.

Mr. C. H. Brodie then read a paper on

The Planning and Construction of American Frame or Timber Houses.

Mr. Brodie said :—Frame houses are the type of American homes—no matter whether you go to the north, south, east or west. In the actual town areas the erection of timber houses is now forbidden—as you may naturally enough suppose when I tell you that the fact that they were not at that time tabooed accounted for a loss of some 40,000,000*l.* sterling caused in Chicago alone by the great fire there on October 8 and 9, 1871. This fire practically cleared three and a half square miles of the best and busiest portion of the city, and destroyed something like 17,500 buildings. Still, in the Southern States universally, I am told, and over the country and suburban districts which I saw myself, it is rarely that any but a timber house is erected. And the reason for this is simple. In the first place, directly a man is well enough off to live out of town he buys the freehold of a plot of land. On this he wishes, of course, to build a house—not to last all time, but to last his time, and, perhaps, also that of those immediately following him. He wants it, too, "right now," as he would put it, and "don't want to wait a year or so" before taking possession. On special inquiry I am told by an architect of much experience that the average time for erecting a frame house is ninety days, but he has known many built in sixty days; whilst, also in answer to my question, he tells me that the life of the structures may fairly be averaged at fifty years, whilst there are very many in existence even a hundred and some two hundred years old and over. Again, quarries being as yet worked are few and far between, and brickworks are not by any means numerous. But the country abounds with the most beautiful timber, with which even the denuded Eastern States are kept plentifully supplied by means of immense rafts floated down the great rivers to convenient points for transport by rail or boat.

A mere glance at the drawings I have here will, I think, convince you that a frame house may be very expeditiously erected. For what do the drawings show? A basement, rising only a foot or so out of the ground, built of either brick or undressed stone, and on this a frame of what we call quarter partitions, two storeys high, forming enclosure and divisions. These and the joists being fixed in position, the roof can be immediately constructed and covered in, so that whilst the outside is being completed the inside, too, is progressing, and during the time that we should be getting up a scaffold the frame-house is built. The plasterwork being then, if necessary, dried by artificial heat, the joinery and other fittings are placed and the dwelling is ready for occupation in the time I have stated. Should the worthy owner's family increase, as families do even in enlightened America, additions to the house are just as easily and expeditiously made.

And now let us look at the plans. As I have said, these show a basement and two upper storeys, and the roofs being mostly of a steep pitch plenty of room for attics is obtained in them. The basement contains a laundry, beer and wine-cellars, coal ditto for both house and furnace-coal, larders and, most important perhaps of all, the heating-chamber, containing either a boiler for steam or a furnace for hot-air heating. The heat there generated is distributed by ducts quite evenly over the whole house, and many of the rooms, you will observe—in fact, most of the rooms—have no fireplaces. This is a stage of civilisation to which we, I regret to admit, have not yet generally attained. To warm by direct radiated heat a space of about 10 feet square, or less, with an enormous expenditure of coal, seems to be still our ideal. I do not mention the beautifully heated column of air, &c., extending vertically above the fire, because the occupants of the house do not get the benefit of the heated air, although those outside do get that of the, &c.—much to their sorrow at times. But still we have that proud possession of our race, the "domestic hearth," so let us freeze in our staircases passages and even bedrooms, and continue, by our actions at all events, to wish long life to both fog and soot. Where fireplaces do occur, and this is chiefly on the ground-floor, an ashpit is provided under each, into which, when the hearth is swept up, the ashes, &c., are dropped by moving a dump or hopper. These ashpits are marked on the basement plans. The ducts of which I have spoken serve in the hot weather to distribute cold air over the house, the air in the cellar, whence they start, being naturally cooler than that outside, whilst it can, if necessary, as it frequently is, be cooled still further by artificial means. On the walls you will see a sheet of illustrations of hot-air furnaces and also of steam-radiators cut from advertisement sheets. The form of the latter has become familiar to most of you during the past two years from their frequent introduction into theatres, &c., whilst it would take an engineer to fully explain the former.

Coming to the ground-floor, or first storey, as you will notice the plans have it, we find a parlour and dining-room, and also perhaps a library or a second parlour. The dining-room is always in connection with the kitchen through a lobby or pantry. You will note also that there is no scullery shown, although on some of the plans is a diminutive space marked "sink-room." On this floor are also various store-rooms and closets, w.c.'s, lavatory, &c., depending as to size, number and variety on the general dimensions of the house. And here I would call your special attention to the very complete way in which these, like all classes of American houses, are fitted with cupboards, shelves, drawers, sideboards, book-cases, &c., all conducing in so eminent a degree to the comfort and ease of the occupants. I venture to think that in this respect too we are much behind our over-sea cousins, and even when designing for them our architects seem to avoid consideration of such real necessities. Take for instance a design hung on the wall by one well known to most of us. There are but two cupboards on the ground-floor and two in the attics. The four principal bedrooms have none. Now, I can assure you that no bedroom that I occupied in any private house in the States was without a cupboard large enough to walk into and turn round in. The convenience of this is too obvious to need expression.

The hall is always furnished and used as a room; you will see most of the plans have it designated "reception-hall," and some even "sitting-room." The verandah is also a most important feature, and one never omitted. During the hot season it is enclosed with blinds, and becomes the most frequented part of the house, even the lighter meals being served in it.

The first floor has the usual bed and bath-rooms, linen closet, &c. You will observe that in most cases the w.c. apparatus is kept away from, and not, as with us, next to the outside walls. This is to avoid fracture by freezing during the intensely cold weather. I may here tell you that in Chicago I have passed several weeks with the thermometer all the time many degrees below zero. At St. Paul, the week before I got there, the thermometer had gone down to 40 degrees below zero, and yet in that district this is but little felt, as there is a total absence of wind—a happy case, in which Chicago never

shares; it is known, in fact, as the windy city. I was in New York the day of the great blizzard, and had to go to and from my office on foot, after scrambling down from the elevated railroad. I show some photographs of the effect of this blizzard. It is a little disconcerting to an Englishman to go home to tea, and, being on the opposite side of the street to the house which, in that case, he is so desirous to enter, to see a bank of snow extending from the footpath he is walking on to the first-floor window-sill of his domicile. We get weather here, and some of us grumble at it perhaps, but other places share an even worse fate. To return to our first-floor plan. You will note that all the chief bedrooms have a fixed lavatory fitting, generally in a cupboard, so as to be out of sight. This adds, of course, very considerably to the plumber's bill, but in the long run it is a great saving, for labour of all kinds is terribly costly, and this is especially the case with what is called domestic "help"—even if such is obtainable at all. See what is saved annually in breakages, and in the labour of carrying up clean and taking away dirty water. Balconies are freely provided on this floor, and are delightful spots in the hot weather, whilst they always form a feature in the elevations. The attics are used for servants' rooms—each still with a cupboard, you see—boxrooms, storerooms, &c., or the space is frequently just floored and then left to be cut up as the wants of the occupants may later on suggest. About the elevations, outside and in, or—to adopt the cant phrase now happily less and less heard—the artistic part, I shall say nothing except that, to our eyes, at all events, the calm and dignified treatment of the English example contrasts very favourably with the fussiness and, if I may use the term, over-picturesqueness and evident striving after "features," which spoils so many of the other designs. One must remember, however, that in dealing with such a pliable material as wood, the temptation to let-off all one knows is undoubtedly a strong one.

And now as to the construction. This you can study at your leisure by referring to a specification printed in blank, which is in the Institute library. It is indexed under the name of the publishers, Messrs. Palliser, of New York, to whom I am indebted for a good deal of the information this paper contains, and for a drawing and specification hung on the wall. Some books published by this firm can be obtained at Batsford's, if you wish to pursue the subject. From the specification I have mentioned I have taken rather copious extracts, which I fear it would be tedious to read or listen to, but I was certainly struck with the very practical character of most of them. For instance, among the general clauses I read:—"The carpenter will make all patterns, &c., and will provide suitable protections to all openings to keep out the cold, rain, &c., and will clear the building of all carpenters' waste materials before the plastering is commenced. The mason must provide coal and stoves in cold weather for heating the building while his work is going forward and until it is dry."

Continuing, we shall get particulars as to how this class of house is put together, and we naturally find after the general clauses the necessary directions as to the excavations. The only unusual point here is that I read:—"The bank is to be dug well away from the walls, and left open until the walls are set and dry." Then the footings are described. They are for both brick and stone walls, "large flat stones not less than inch thick, and projecting inch on each side of the wall above, and to be laid on the natural undisturbed earth." Their width and thickness would depend, of course, on the weight to be carried and the nature of the soil. The damp course is to be either slate and cement or asphalte. The brick walls are required to be built to "a true line from one end to the other, even to the cutting of a brick where necessary, so that the carpenter can size the joists to an exact width, and place them directly upon the wall without blocking up with chips or pieces of wood."

The facing of these brick walls is to be "neatly tucked and properly cleaned down with aquafortis, and oiled with raw linseed-oil at completion," care being taken not to injure, in cleaning down with the acid, any cut stonework. The laths for lathing are to be "laid a full quarter of an inch apart, and joints broken every 18 inches." Wood laths, however, are now rarely used. I never saw any at all. The plastering is put on wire-netting or one of the many forms of pierced or expanded metal now coming into use in this country. The plastering is to consist of "a good coat of brown, well-haired mortar, made of pure unslaked lime and clean, sharp bank-sand, free from loam and salt, and best cattle or goat hair, well mixed by continued working, and stacked in the rough for several weeks before putting on." The finish is to be "a coat of best soap-stone finish, manufactured by ——— Company, composed of finishing-lime, putty (two parts), and patent soap-stone finishing (three parts), thoroughly mixed two days before using, and applied in the most careful manner as per directions," I suppose of the manufacturers. I am of course following the order of the trades as they are placed in the specification, from which I am quoting. This differs considerably from our usual arrangement, and we next come to the carpenter and joiner. All the timber which will be exposed at the finish is required to be of a certain quality pine. The joists are to be placed in all cases with the "crowning" edge upwards, and those over so many feet in length are to be "worked crowning" so many inches before being placed in the building.

Describing the partitions—a most important item of a framed house—the specification directs that "all door and window studs are to be set double, and all openings over 3 feet wide trussed overhead. All angles must be formed solid by blocking and spiking two studs together. No studs are to stand on the floor, nor on the joists, if there are partitions under, but all are to foot on top of the partition plate below." The outside of the external partitions, and also the roof, is covered with $\frac{7}{8}$-inch match-boarding, called "sheathing," which has to be "nailed at each edge at every bearing with 10*d.* nails." Here I may add that nails are throughout the specification described as so many "penny" ones—a nomenclature common also in Ireland, I am told. The whole exterior is then covered with waterproof felt, the joints lapping 2 inches, and it is tarred under all architraves, friezes, cornices, brackets, &c., "so as to make a perfectly tight job." Outside this felt comes the finish, which is actually seen, which on the partitions is weather-boarding, or, as it is called in the States, "clapboarding." This is to be of "clear, dry, bevelled white pine, 5 inches in width by $\frac{1}{2}$ inch thick at the butt, and $\frac{3}{16}$ inch at the thin edge, laid with not less than a lap of $1\frac{1}{4}$ inches, and nailed with 8*d.* box-nails every sixteen inches. The nails to be set in." The verandah floor is to be constructed with $1\frac{1}{4}$-inch by $3\frac{1}{2}$-inch white pine boards laid with "paint-joints." The roof is generally covered with shingles, and so also are the gables and other features. The shingles are usually of cypress, which grows abundantly in the swamps of New Jersey and the more southern States. The logs are floated down the rivers to the various mills, where the shingles are cut in enormous numbers. I read of one mill cutting 300,000 daily. They are about 18 inches by 6 inches, and are fixed on battens, with on roofs $5\frac{1}{2}$ inches to the weather and on vertical parts 6 inches, each nailed with two nails and kept 3 inches from angle of valleys. Sometimes the roofs are of slate, and frequently they are flat, in which case they are mostly covered with tin, although asphaltum or gravel composition is sometimes used. In either case the roof is boarded on the joists with $\frac{7}{8}$-inch boarding.

Coming to the floors, I find that pugging, or, as it is called, "deafening," is used to all the best rooms, and these have also a double floor, a rough deal one and a hardwood finished one, with between them a layer of "all-wool, Pyramid-brand, resin-sized, deafening felt," fixed down by 2-inch to $\frac{1}{2}$-inch slips, to which the hardwood floor is secret-nailed. The rough floor is described to be fitted carefully round all studs, &c., up to the sheathing, so as to prevent mice circulating. Here is a good clause:—"All the plastering is to be finished, cellar cemented and all masonwork done and thoroughly dried through before any of the interior finished joinery is brought into the building or put into position." The materials used for doors are required to be thoroughly seasoned and kiln-dried, and on the plans the sizes for both width and height are figured. Sliding-doors are much used, while many openings have no doors at all; these would be provided with curtains, which give the desired privacy. There is no question of "draughts," you know, in an American house, which is warmed equally throughout. All the doors have a hardwood slip $\frac{3}{4}$-inch thick, splayed each edge, fixed under them. This enables the door to open clear of carpets, &c. The windows are mostly double-hung sashes requiring no special description. All are directed to have a burglar-proof fastening.

After a description of the stairs, most minute directions follow for the fittings of the various pantries and closets upstairs and down. These include clothes-closets, linen and china ditto, and butler's and kitchen pantries, as well as the various store-rooms. The descriptions are most interesting, but would, I fear, take too long to read. Then we get a full description of the refrigerator and ice-safe, which consists of two thicknesses of boarding, 2 inches apart, filled with mineral wool, then an air-space of 1 inch and a layer of rosin-sized waterproof paper, the actual inside being of clean, narrow-matched spruce. The lower part is the ice-safe or tank, and it is lined with sheet zinc and the bottom covered with a wood grating, to prevent the ice cutting the metal. The doors to these spaces are constructed in precisely the same way, and the joints between door and frame are double rebated. The wood finish is described to be first a certain patent "mineral filling," and then another "patent transparent wood finish." The hardwood floors are to be done in the same way, but with "vegetable" filler. The tin-work is to be painted two coats of metallic paint, and here I may say that this tin—or to speak more correctly, tinned-iron—is used wherever we use lead, and also for the rain-water pipes and gutters. Lead is too expensive, and is also more affected by change of temperature. The hot-air ducts from the furnace in the basement, of which I have previously spoken, are also made of tin, and are run up in the partitions. The hot air is delivered into the rooms through a sort of hit-and-miss grating called a "register." The positions of these are shown on the plans.

Coming to the plumber's work, I find that the soil-pipes are invariably of cast-iron, the joints being made with oakum and lead well caulked. They are painted on the outside with two coats of metallic paint, one before and one after fixing. Inside they are coated with coal-tar, or the pipes are "Mott's enamelled soil-pipe, not less than $\frac{3}{16}$th thick." The soil-pipes are kept well within the building, the water-closet apparatus being, as I have said, away from, and not next to, the outer walls. The syphon intercepting the drain from sewer is fixed within the cellar, and the drains generally, in fact, are inside and not outside the building, so as to be clear of frost. The water-pipes are of lead, all so arranged that they may be run dry, also to baffle that demon "Jack Frost," and laid on wood-strips or in wood-troughs. And here occurs another very practical passage:—"The plumber is not to cut any timbers; that will be done by the carpenter, and he shall not cut any to weaken them." Would that we could enforce that clause on both plumbers and gasfitters. Joints (lead to iron) are made with brass ferrules soldered to lead and caulked to iron as before described. The whole of the drainage has to be done according to municipal plumbing regulations, which are very strict. They often require that all soil-drains, as well as the vertical pipes, shall be of heavy cast-iron, and in all cases that the soil-pipes shall be carried through the roof full size and left open at top, and that an air inlet shall be provided on the house side of the intercepting syphon. Also that all sanitary fixtures shall have a trap as close to them as possible, each of which must have a back-air inlet to prevent syphonage. Brass-piping is sometimes used for hot-water connections, but galvanised wrought-iron is much more common and seems to be equally satisfactory.

As to the cost of these frame houses, one of the buildings illustrated is shown to have cost 2,935 dols. or 587*l*. This is a small house. A friend of mine writes me that he is just about building a ten-roomed house, which he says will cost from 700*l*. to 850*l*., and he puts the life of this as at least fifty years. A very small house illustrated and described in a local paper is said to cost only 1,500 dols. or 300*l*. In conclusion, may I say that I will answer, as far as I can, any questions which may be put to me; and I will vary the somewhat dry matter of this paper by quoting the dedication of a book of designs of houses of this class. Prose is evidently too feeble to properly commend the subject, so the book is inscribed:—

> To those who happy homes have always known,
> To those who plan and work such homes to own;
> To all who building homes would bless mankind,
> To all who in their homes a refuge find;
> To youth, whom wedded life will soon employ,
> To children dear, each day their parents' joy;
> To all who favour honour, truth, and love,
> To all whose virtues promise homes above.

Mr. Owen Fleming proposed a vote of thanks to Mr. Brodie for his paper. He did not hold the view that wood-surfaces stained and varnished were as effective and pleasing as Mr. Brodie considered them. In regard of the drawings exhibited some of the elevations were examples, he thought, of what was to be avoided. Others had been treated more satisfactorily. Others showed the architect had aimed at producing a simple effect for his building by long unbroken roof-lines and wall-surfaces. The buildings so treated were more effective than those covered with stuck-on features.

Mr. Horace Townsend seconded the vote. He said he had practised as an architect in America for over twelve years. He protested against criticising American architecture as fussy. Fussiness was no characteristic of American buildings, though it might, perhaps, have occurred in some of the buildings illustrated in the American papers. Some of the best architects would not let their buildings be illustrated. Their fault, in his opinion, was rather a straining after an artificial simplicity, an affectation that was as objectionable as fussiness. He instanced the old colonial buildings of simple character as having served as the model to the best American architects for designing comfortable houses. Among the features peculiar to America was the use of tinned iron for roofs, a cheap material and a lasting one if cared for and painted. Another excellent feature was the use of a hardwood sill to carry the door. Another feature was the absence of sculleries. In place of them a sink was placed in the kitchen. The sinks were deep and prevented any splashing over. For washing purposes several tubs from 18 to 24 inches deep were let into the floor fitted with grated outlets and supplied with hot and cold water. In concluding his remarks Mr. Townsend said American architects were quite able to take care of themselves and that they were in some respects ahead of architects in England.

Mr. F. T. W. Goldsmith said what struck him particularly in American architecture was the clever planning, all being arranged to save labour and to secure the convenience of the inmates. He much preferred the open fire to any system of heating by hot-water pipes. In addition, with hot-water heating there was the risk of an influx of cold air from outside.

Mr. Farrow said he preferred the open-fire system to that of conducted heat. The effect of stained woodwork, he said, might be seen at Professor Herkomer's colony at Bushey. Wood houses, no doubt, were cheap and easily built, but one drawback was the risk of fire.

The President then put the vote, which was further supported by Messrs. W. H. White, J. W. Penfold, J. A. Shaw and E. Woodthorpe, to the meeting, and it was carried by acclamation.

Mr. Brodie, in replying, said the wood used for joinery was so beautifully marked that it would be a shame to paint it. The entrance of cold air was guarded against by the provision of double doors and double window-sashes, lobbies, &c. In regard of risk from fire, wooden houses were mostly isolated. There were no fireplaces and the floors were fireproof, and thus they were not very inflammable.

LINES OF FRONTAGE AND CORNER HOUSES.

An appeal was heard this week in the Queen's Bench Division which relates to the exercise of the power for regulating lines of frontage in new neighbourhoods where there is no "street" formed or any definite visible line of frontage. It was a case stated under section 3 of the Act of 1888 (51 & 52 Vict. c. 52) to amend the Public Health Act, 1875, with respect to bringing forward houses or buildings in streets, the section being in these terms:—"Section 156 of the Public Health Act of 1875 is (save as mentioned) hereby repealed, and in lieu thereof it is hereby enacted that it shall not be lawful in any urban district, without the written consent of the urban authority, to erect or bring forward any house or building in any street, or any part of such house or building beyond the front main wall of the house or building on either side thereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building on either side of the same." The question had arisen, How, if a house is a corner house and is in a new neighbourhood in which no street has been formed, is this enactment to be applied? The case occurred at Clacton-on-Sea on the coast of Essex within the rural sanitary district of Tendring. The charge was that one Warren unlawfully, and without the consent in writing of the sanitary authority, did bring forward a certain house, forming part of a street called Castle Road, beyond the front main wall of the house on the west side thereof. But the house was at the corner of Castle Road and Old Road, and having its main entrance in Old Road. The first buildings erected in Castle Road were eleven cottages, still standing and occupied, the actual buildings and the entrance to each standing 8 feet back from the road, that space belonging to the owners of the cottages and used by the occupiers as gardens, and fenced off from the road, and so forming no part of the footpath or road. Between the last of the cottages and Warren's is a space of 64 feet, not built upon, but marked out and intended for building on. Warren, the defendant, had used a space of about 36 feet in depth of his "return" frontage in Castle Road for the purpose of forming a yard, back premises and garden to his house, the house in question. Thence commences the so-called "return wall" of the house in Castle Road, the subject-matter of dispute in this case, which wall is built close up to the footpath in Castle Road for a length of about 42 feet. The Castle Road in question is a *cul de sac*, and the land beyond the cottages is open pasture. The portion of Castle Road opposite to the house of Warren and to the extreme end is not built upon and is open land. It was admitted that the house in question was situate at the corner of two roads, Old Road and Castle Road, the principal entrance being in Old Road and having a so-called "return frontage" in Castle Road. It was proved that Warren was owner of the whole area of the ground on which the house stands, and that the local authority had not expressly fixed any definite building line in Castle Road, but they had approved of the plans for the eleven cottages, and so, it was said, had impliedly adopted a building line, beyond which a new building on either side thereof could not be brought forward, and the question was whether that was so. The magistrates convicted the defendant, who appealed. He contended that the house in question was in Old Road and not in Castle Road, and that the frontage in Castle Road was only what is known as a "return frontage," and therefore not amenable to the building line in Castle Road; and that, assuming that the house was in Castle Road, there was no house or building on either side of it beyond the front main wall of which on either side the defendant had erected or brought forward any house or building, and that the erection of the eleven cottages was not a "fixing" of the building line by the rural authority. The magistrates were of opinion, however, that the house was both in Castle Road and Old Road, and that it was amenable to the building line fixed in Castle Road, and was a continuation of a straight line formed by the front wall of

the cottages, which constituted houses or buildings on either side of the house, and that therefore Warren had brought forward a house and building beyond the front main wall of the house or building on one side thereof. The question was whether these findings were correct in point of law.

For the defendant (the appellant) it was contended that the house was in Old Road and that the cottages formed no "line of building" beyond which it could not be brought.

On behalf of the rural sanitary authority it was contended that the conviction was right. The house was in Castle Road or in Castle Road and Old Road, and the cottages formed the "building line" beyond which the house could not be brought. The question was important, as this was the only enactment which gave the local authorities any power to keep new buildings within any line of frontage. [Mr. Justice Mathew: That view might entail great hardships upon individuals.] Possibly, but Parliament must be taken to have contemplated that.

The Court came to the conclusion that the conviction must be upheld.

Mr. Justice Mathew, in giving judgment, said it appeared there was a row of cottages at a certain distance, and the complaint was that the house in question was brought forward beyond the line of those cottages, which, it was said, formed a building line, and the magistrates had come to that conclusion. That interpretation, no doubt, led to some startling conclusions, for this consequence would follow—that the owner of the cottages would have a right to pull them down and bring forward the line of building. But though that was a startling result, could the language of the Act be got over? There was a protection afforded by the requiring the consent of the local authority, and also by the judicial power of the magistrates, who, however, in this case had decided against the defendant. It had been ably argued by Mr. Grain that the cottages formed no line of building, but the magistrates had found that they did form such a line, and that the house was in Castle Road and amenable to that line. The Court could not hold as matter of law that they were wrong in their view of the facts. They had found that the cottages were on one side of the house in question, and that finding must be taken. There was a decision in Raventhorpe *v.* Hincliffe (24 Q.B.D.) to that effect. The conviction, therefore, must stand.

Mr. Justice A. L. Smith was of the same opinion, and pointed out that the present enactment clearly applied to new buildings. It had been held no doubt in the case cited that the frontage taken must be "in some degree of proximity to the building in question." But that was a matter of fact for the determination of the magistrates, and in this case they had determined that the frontage formed by the line of the cottages was in sufficient proximity, and, whatever he might think of their decision and however much he might regret it and regret the hardship it might cause to Mr. Warren the Court must adopt it.

Conviction therefore upheld and appeal dismissed.

THE PROPOSED ART GALLERIES, GLASGOW.

THE opening meeting of the architectural section of the Glasgow Philosophical Society was presided over by Mr. James Thomson. In his address, he began by referring to the extension of the municipality, and to the chances of the solution of the cross-river question. It had been said that the history of industrial Glasgow was written in its bridges; but he thought it was known best by its well-laid-out streets and substantial buildings. One subject uppermost in their minds at the present moment was the proposed erection of an art gallery and museum. The discussion on the latter subject had brought up sharply the fact that our city had been far behind in providing places of recreation for the people and a home for the art school. They all knew the struggle for existence the Glasgow School of Design had had for many years, although it had distinguished itself by gaining a high position among the schools of art in Great Britain. It should be the interest of the people of Glasgow to see that the school of art was not only perpetuated but cared for by such enlargement and endowment as was necessary for the encouragement of students in all the branches of art, as well as of our painters, who had made a name for themselves. The site which had been placed by the Corporation at the disposal of the Association for the erection of the new gallery was in many respects a most admirable one. No doubt it was far distant from the business part of the city, and very much out of the way of residents in the eastern and south-eastern districts. But this objection was rapidly in process of being overcome. As he did not intend to send in a competitive design, he thought he might offer some suggestions as to the position of the building. The first difficulty which occurred to him was that the surroundings of the site shown on the block plan were in many respects unsuitable. The whole southern frontage of the new building would be hidden from view by several four-storey tenements of shops and dwelling-houses of the ordinary kind. Then at the centre of the site the main thoroughfare took an angular direction. He thought the promoters should carefully consider the propriety of changing the site. Dumbarton Road had become a great thoroughfare, and it would be more so every year. Any important building to be erected in that neighbourhood should be made to face the best thoroughfare. By placing it in the position indicated the building would not only have a frontage towards Dumbarton Road, but it would have a southern aspect. This need not interfere with the other elevations, as they could be treated in relief. As to the question how this change of site could be accomplished, he suggested the removal of the buildings on the triangular piece of ground to the west of Radnor Street. No matter what the expense might be for this part of the scheme it ought to be carried out. By this alteration they would secure for the building a good background, and the general features might be made to harmonise with the surroundings. In concluding, Mr. Thomson said if the promoters tried to carry out the present idea of having galleries only for pictures and music, and making the art school a secondary affair altogether, they might depend upon it it would end in failure. On the other hand if they resolved to have a well-equipped art school, it would be sure to prove a success. On the motion of Mr. Campbell Douglas a vote of thanks was passed to Mr. Thomson for his address.

ARCHÆOLOGICAL DISCOVERIES ON THE GREAT ST. BERNARD.

DURING the last two summers, says a correspondent of the *Scotsman*, Professor von Duhn, Professor of Archæology in the University of Heidelberg, in conjunction with some Italian scholars, has been conducting excavations on the Pass of the Great St. Bernard. From the experience gained in other Alpine passes, archæologists had long since suspected that a careful search would also reveal remnants of ancient settlements on this the most important of the Alpine passes, and in 1890 the assistance of the Italian Government enabled the excavations to be begun.

The exact track of the old Roman road across the narrow plain which covers the top of the mountain having been ascertained, a ditch was dug from the northern end of the plain towards the east, and after a few weeks' careful excavation, the ruins of a Temple of Jupiter were laid bare. Similar temples have been found on almost all the other Alpine passes, for it was customary for the Roman traveller, in the fresh and bracing air of these Alpine regions, to adore the God of the Skies, thanking him for his kindly protection on the journey, and presenting him with small offerings. These offerings consisted mostly of small votive tablets and coins, sometimes even of statues, images and other valuable gifts. Many coins were found in and around the temple, but it is remarkable that all belonged to the Imperial period, scarcely any Republican coins having been found on the ground so far as excavated, a fact which has some significance in regard to the date of the origin of this settlement. It points to the conclusion that, like all the other Alpine roads, the Great St. Bernard Pass was not used as a commercial road between the south and the north of Europe in the time of the Republic.

Of course the lowest Alpine roads were known to merchants in very early times, but they were used only for the local trade between the valley of the Po and the South of Germany. The Greek and Roman merchants were afraid of the towering chain of these snow-clad mountains, with their wild and barbarous tribes, and had found out a much easier way to the north, going either from Massillia (Marseille) up the Rhone Valley to the interior of Gaul and Southern Germany, or starting from the shores of the Black Sea, whence a very old commercial road led them to the coasts of the Baltic and the German Ocean. This also accounts for the curious fact that the harbour of Genoa and all the ports of the Adriatic, Venice, Trieste, Brindisi, &c., which played such a prominent part in the Middle Ages as transport ports for the Oriental traffic, either did not exist or were little known in those ancient times.

It was not until the days of the Roman Emperors, when the government of the northern provinces necessitated a closer connection with the mother-country, that the Roman merchant followed in the steps of the Roman soldier across the Alpine roads which were then being constructed, and which even now excite the admiration and astonishment of the travellers. Of all these passes the great St. Bernard, deep and inaccessible for carriages as it is, soon became the most important, being the gate for all the troops which were going to or from the northern provinces—Gaul, Britain and Germany—a fact which renders the results of these excavations of so much moment to archæological science.

On the other side of the road, opposite the Temple of Jupiter, stands a small hill with steep and precipitous sides, the excavation of which was begun this summer. In spite of the most careful investigation, no remains of a building were dis-

covered on the top, and nothing but two small holes in the shelf of rock showed the activity of human hands. But in all the clefts of the rock Gallic coins were discovered, and it puzzled the antiquaries at first to account for this phenomenon. But this had evidently been the site of an old Celtic sanctuary, and the coins thus disinterred had the same significance as those found in the Temple of Jupiter. They were offerings presented to the deity. The entire absence of ruins is another proof of the well-known fact that the Celts, like the old Germans, preferred to adore their gods in the open air, and without a building or an offering-cup they simply dropped the coins into the crevices of the rock.

From this hillock the ground slopes eastward towards a small pond which gathers the waters of the surrounding heights into the basin. Professor von Duhn had this pond drained by means of a dam, as it seemed not improbable that some valuable relics might have been carried by the water into the basin, and the result fully justified the expenditure of labour. Almost the first cut with the spade revealed a neat little bronze statue of Jupiter, which, though not a first-class work of art, yet affords evidence of considerable technical skill, and had been very probably taken from one of the north Italian brass foundries. Soon afterwards a quaint little brass horse appeared, wearing a saddle of panther's skin. Several other images and precious articles were then dug out, but no ruins of a building nor coins were found, which points to the conclusion that the pond must already have existed in Roman times.

Further excavations in the middle of the plain, west of the road, laid bare two rooms of a large building, the full examination of which has been postponed till next year. It seems clear, however, that the whole plain must have been covered with buildings, as the very extraordinary position of the Temple of Jupiter suggests. The back wall of the temple is built so close up against the cliff that part of the rock has been cut away to get sufficient room for the temple. Had the rest of the plain been empty at the time when the sanctuary was built, it is more than probable that it would have been put in the centre of the plain, and not banished into the most northern corner.

A further discovery of the highest importance was made by Dr. Schumacher, a German scholar, who was present at the investigations this summer. After breaking through the Mediæval Roman and Celtic strata, they had everywhere struck a layer of yellow clay, which apparently had settled down from the waters of the neighbouring mountains. As the formation of this layer must have required a good deal of time, it was inferred that the clay stratum marked the bottom of the ruins, and that it was no use to dig deeper. Dr. Schumacher, however, was led to pierce the clay layer at several points, and a stratum of charred remains came to light. No doubt we have to do here with the ruins of a settlement preceding that of the Celts, and as the clay layer is of considerable thickness, it is apparent that, after the destruction of this settlement, the Pass must have remained unused for some length of time. These remains may even date back to the Etruscan period, but this and many other points can only be settled by further excavations.

AIR ANALYSIS IN MANCHESTER.

THE Town Gardening Committee of the Field Naturalists' Society have received the subjoined interim report from the Air Analysis Sub-Committee.

In prosecution of the work already commenced, records of the character and composition of the air are now being carried on, taken at six stations, of which four are situated in Manchester and two in Salford. For the carrying out of the necessary operations at the stations we are indebted to the enterprise and co-operation of a number of persons who have interested themselves in the question, whilst the testing and final determinations are made at Owens College. The amounts of sulphurous acid and organic matter have been observed regularly during the past three months, and, although there has been as yet no period of serious or long-continued fog, a very marked increase has taken place, both in sulphurous acid and organic matter, especially during the past month. Speaking generally, the district of Ancoats and the centre of the city show the greatest amount of pollution. In addition to this work, samples of rain are from time to time collected in various districts and analysed. A further expansion of the work consists in the measurement of the intensity of the light in various parts of the city and suburbs. The amount of light is measured for each day by means of a sensitive solution, and with the valuable assistance of a competent observer at each of the thirteen stations now in operation it is possible to compare the quantity of light (not sunlight only) at the different stations. It has been established that not only the life and health of plants, but also that of animals is largely dependent on light, and we therefore attach great importance to these observations. From the results already obtained it appears that—1. Taking the amount of light (chiefly actinic light) received at Didsbury as 100, we find the average amount for this period of the year is in York Place, Oxford Road, about 80, whilst in Embden Street, Hulme, it is only 65, and in the centre of the city and at the meteorological station in Oldham Road it falls to 50 or 55. The following records, extracted from the observation-book, showing the returns for a few typical days and representative stations, will indicate the character of the observations made :—

	Didsbury.	York Place.	Hulme.	Oldham Road.	London Road.	Sunshine.
Sept. 12, Bright and sunny all day .	60	45	35	34	11	8·5
Sept. 16, Dull all day . . .	30	22	14	17	11	nil
Sept. 20, Very dark all day . .	8	4	2	3	11	nil
Oct. 8, Morning sunny, afternoon dull	42	35	30	24·5	27·5	5·7
Oct. 11, Gloomy till ten, then dull .	20	12·5	12	9	10	nil
Oct. 15, Dull, with heavy clouds .	14	8	6	5	7	nil
Oct. 24, Foggy nearly all day . .	15	2	4	2	3	nil

2. In the summer months the difference between town and country is not so large, but it becomes more and more pronounced as the winter months are reached. 3. Fog cuts off the actinic light almost completely, the record in the country (free from fog) being for the same day 10 to 20 times that in town. 4. The general falling-off of light as the season advances is also most striking, the amount in October, taking similar days, being little more than one-third that measured for August. In connection with this subject we may further mention that the observations on the clearness of the atmosphere have been carried out by Mr. Roos at the Town Hall since the commencement of February, and it is proposed that they should be continued so as to embrace the period of a whole year.

A grant of 50*l.* has been received by the committee from the Royal Society out of the Government fund towards defraying the expense of carrying on its work. The committee have become incorporated with the Scientific Committee of the Royal Horticultural Society, who are conducting similar inquiries in London. These inquiries are taking place under the supervision of the Manchester section.

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

THE NUREMBERG VIRGIN.

ARCHÆOLOGY would be incomplete if it did not take notice of the relics which suggest old modes of dealing with offences. Hardly a century has elapsed since it was said that property in England was hung round with gibbets; but abroad, and in a past age, not only property, but position was encompassed by things that were more terrible. In Nuremberg artists and poets abounded, and evidently there was no lack of imagination among its inhabitants. They turned it to account in devising instruments of torture which were unparalleled at the time, and unhappily the parts of the buildings where the punishment was inflicted were no less ingeniously planned. Few men have had the courage or the opportunity to explore all the dungeons of Nuremberg, and therefore the following account of them by Mr. R. L. Pearsall is as unique as it is fascinating :—

Everything involved in mystery carries with it a certain degree of interest, especially when connected with the history of the past; and there are few things more deeply so involved, and more calculated to show the worthlessness of criminal tribunals under irresponsible authority than the singular judicial enormity commemorated in the following pages.

In England we have been barbarous enough, cruel enough, and bad enough during the early part of our history; but, thanks to the publicity of our judicial proceedings, those who fell under the hands of the executioner perished before the eyes of the world, in a mode prescribed by the law, and obliged to be followed by its officers. This was not the case in other countries. Wherever there was a despotic monarch, or an irresponsible corporation endowed with an unlimited criminal jurisdiction, men were accused, imprisoned and never more heard of. Their probable fate could only be guessed from circumstances, or some unguarded expression from the lips of such as were likely to be aware of it, but their possible fate was not so much a secret. "Let fear come to all" has been a common maxim amongst penal legislators; and in order that fear might come to all under the governments of ancient Continental Europe, they did not hesitate to insinuate darkly the means which they had of proving and punishing crime whenever a man might be accused of it. Notwithstanding this, it was seldom or never the case that men knew what torture or death might be in store for them, if they rendered themselves liable to the suspicions of their magistrates.

"Passer par les oubliettes" was a well-known phrase in

France, and yet few were able to define its meaning accurately. Every one, however, understood that where a man was considered by the tribunals to be guilty of certain crimes, he was doomed to pass, as it were, into oblivion by descending, through trap doors called oubliettes, into the nether regions of his prison, from which he never returned.

"The Kiss of the Virgin" (or Jungfernkuss) was an equally well-known phrase in Germany, and its import was almost as little understood. A general impression, however, reigned amongst the multitude that in certain towers and prisons there was a terrible engine, which not only destroyed life, but also annihilated the body of the person sacrificed; and this, from being constructed in the form of a young girl, was called "The Virgin."

During a residence in Germany, some years ago, chance threw me in the way of hearing much of this engine, without being able clearly to understand what it was, excepting that it exercised the functions of executioner, and exterminated its victims by hugging them in arms furnished with iron blades. Thus they were soon deprived of life. It was said to have existed in many towns and castles and even convents; but more particularly in those secret tribunals which were so numerous in Germany during the Middle Ages, and which are frequently given the credit of having first employed its services. The castle of Königstein, near Frankfort, is said to have possessed one of these instruments of destruction, and a tower in the town hall of Mayence, situated near the butchery, is pointed out as having been the seat of another. I examined both these buildings in hope of finding some vestige which might give me an idea of the form of the machine and mode of its operation, but in vain. I examined other buildings in the Rhine-land, where it was said to have existed, and with as little success, until at last I began to think that I must have been listening to a fable. Many things served to support this idea. In the first place, I could obtain no references to chronicles or documents in which its existence was vouched for; and whenever I asked where I was likely to discover any traces of it, I was almost always referred to the castles of the robber-chivalry of Germany, a class of people who were generally too poor to purchase a machine so expensive as this must have been, and whose criminal justice or vengeance, call it which you will, was likely to have been administered in a much more simple and unmysterious manner. Again, the accounts which I received both of its form and movements were often inconsistent. Some represented it to be an image of the Virgin Mary, which the culprit was told to kiss, and which, on being touched by him, was set in motion by inward machinery, which caused the figure to fall down and crush him. Others said that its arms expanded and clasped him to a breast out of which poniards protruded. Others again represented it merely as an emblem of justice, placed above a trap-door, on which the culprit trod as he advanced to pay her his homage, and which, being left unbolted, sank underneath his weight, and precipitated him into an abyss. The tradition relative to the machine contained in the tower at Mayence represented it to be a sort of hollow wheel, furnished in the inside with knives, which, on being made to turn round rapidly, cut to pieces anything that might be in the inside. This last was a punishment reserved for persons of gentle blood convicted of high treason against the Elector, but persons of inferior birth were simply beheaded and thrown to the dogs.

It is true that one could not wonder at a total silence respecting it in the books of criminal jurisprudence of the empire, for they related to punishments which justice openly acknowledged, while this machine was always represented to be the peculiar and appropriate minister of a secret tribunal, which, from its very nature, could not be governed by any public system of law; but the difficulty of obtaining evidence respecting it, and the contradictory and consequently unsatisfactory nature of the little that I did for some time obtain, made me begin to treat the stories which I had heard as the result of popular error. Added to this, I found almost all the members of the modern school of philosophy prepared to treat the thing as an old woman's tale; and one of them (to whom I was recommended as a man of great historical erudition, who had achieved his education at Paris and was said to enjoy the intimacy and esteem of the most distinguished philosophers there and elsewhere) told me that the whole affair was a mere monkish lie; that every possible instrument of death and torture was to be found in the Bastile; that when the people cleared it out at the Revolution they found no Virgin; and that therefore it was fair to conclude that the thing had never existed but in the imagination of monks and romancers. I remember asking him whether any monk had really mentioned it in a written document. He replied in the affirmative, but stated that, as the monks wrote nothing but lies, he never suffered their stories to dwell on his mind sufficiently to enable him to refer to them a second time. I have stated thus much, at the risk of being tedious, merely to show with what facility we are often led to attribute to mistake and falsehood that which is nevertheless well founded in fact.

Discouraged as I was by the result of my inquiries, I could not altogether hold the thing to be utterly without basis. A grain of truth is often to be found in the most stupid superstitions, even in the most malignant calumnies; and, being loath to treat as mere idle rumour that which had been heard of by every German, and was believed by the great majority of the people, I was tempted to take a middle course, between belief and unbelief, and to conclude that the Virgin must have been the plank or German guillotine, and I mention this circumstance because I have strong ground for believing that both instruments are often confounded in ancient traditions.

The conclusion which I had arrived at was, however, disturbed by a passage which I accidentally met with in a book entitled "Materialien zur Nürnbergischen Geschichte herausgegeben von D. I. C. Siebenkees," (Nürnberg, 1792). The passage in question is represented to have been extracted from a chronicle (which the author has not indicated), and may be thus rendered in English:—"In the year of our Lord 1533 the Iron Virgin was constructed for the punishment of evil-doers within the wall of the Froschthurm (or Frogs' Tower) opposite the place called Die Sieben Zeiler (that is to say, the Seven Ropers); so at least it was publicly given out to justify the thing. Therein was an iron statue 7 feet high, which stretched abroad both its arms in the face of the criminal, and death by this machine was said to send the poor sinner to the fishes. For so soon as the executioner moved the step on which it stood it hewed, with broad hand swords, the criminal into little pieces, which were swallowed by fishes in hidden waters. Such secret tribunals," continues the author by way of comment on the foregoing extract, "existed formerly in many countries. I do not, however, know whether any traces yet remain of the one here described, and I have never read that any use was ever made of it; perhaps the whole affair may be nothing more than a legend."

In May 1832 curiosity led me to Nuremberg, for I had a long time been desirous of visiting a city so celebrated for its antiquities. I was addressed to a person there, said to be distinguished amongst the most enlightened of his fellow-citizens, and who gave me this answer to my inquiries relative to the Virgin. "I have heard of such a thing, but doubt whether it ever existed here. Popular taste in every age has hunted after the marvellous; and here, as in other countries, there have not been wanting foresters to start game for it. If such a machine ever existed in Nuremberg, it must have been at the town hall, where there are yet to be seen the prisons which were formerly made use of in our city: but I doubt whether you will find it there. Such a thing is much more likely to be found in some of the castles in the neighbourhood."

I went accordingly to the town hall, and although I found no Virgin, I found other things which perfectly satisfied me that the old patrician citizens of Nuremberg had no right to ascribe to themselves feelings of humanity superior to those of the old robber-chivalry, who I have generally observed to be a sort of scapegoat amongst the Germans of the present day, and to be accused of almost every vice and violence which distinguished the age in which they lived. Far be it from me to think the ancient magistrates of Nuremberg worse than those of any other city; but we shall see in the sequel with what charity and moderation the high privileges of the Imperial Corporations were exercised. On asking to see the old dungeons of the town hall, I was taken to a place there called the "Lock," or hole, and a horrid hole it was. After a descent of about fifteen or sixteen narrow and rapid stairs, I found myself in a passage which led into a subterranean corridor. Here, on the left hand of the entrance, was a machine very similar to our stocks, which in Germany is commonly called a fiddle. It is a fiddle, however, which must have produced most horrid music; for it was there that those persons who had the misfortune to fall under the suspicion of the old city government received their first notions of its paternal administration of justice, by being invited to confess the crimes laid to their charge, through the silent but persuasive eloquence of thumb-screws and thorn-collars. I was told, indeed, that the accused was merely obliged to wait here till he was introduced to the torture-chamber; but there was something in the form of the bench where he sat which told a different story. I refer to two round holes on which the culprits were obliged to sit, and which plainly showed that the purposes for which they were placed there were expected to derange the animal economy of their bodies, and that convenience and cleanliness rendered such apertures necessary.

On each side of the corridor were prisons, little more than 6 feet square, completely dark and cased with oak; such material affording more security than a stone wall, in consequence of the difficulty of removing planks without noise being greater than that of disturbing bricks and mortar. But any apprehension of escape must have been uncalled for, because the culprits appeared to have been usually chained to the oaken benches which served them for beds. In most of the dungeons was a heavy square stone, about a foot high, the middle of which was hollowed out into the shape of a funnel. This seemed

at first to be intended as a receptacle for fire, but my conductor told me it was intended to serve the purposes of nature. The mind recoils with horror and disgust at the bare idea of a man being subjected to such confinement in such a place and in such an atmosphere. Either the patricians must have had no fellow feeling for those they governed, or else close air and foul smells had formerly not the same effect on our health and nerves as they now have. A little further on there was a torture-chamber, yet containing, in an imperfect state, the stretching machine or perpendicular rack, and in a vault still further on, and which was also occasionally used as a torture-chamber, there were two stone weights, one of fifty pounds and the other of a hundred, which used to be attached to the ankles of the persons who were put to this variety of the question. "Some years back," said my conductor, "a complete torture-apparatus, boots, collars, thumb-screws and all other appurtenances were to be seen here, but they have since been removed and sold for old iron."

Near the entrance of the vault in which I found the stone weights was a stone door. "That," said my guide (who was an old man and had been from his youth upwards the guardian of these regions), "leads to the subterranean passages which were formerly the place of refuge of the patricians in time of tumult or other danger. Each of them had a secret door leading from the cellar of his house into these passages, by means of which he could escape and remain there till any danger which threatened him had passed away. The chief of every patrician family was bound by oath to keep secret the position and existence of such door, and to wall it up if ever misfortune or necessity should oblige him to part with his house to any one who was not of his own order. There are a great many of these passages, and some of them are extremely long and have never been thoroughly explored. It is said that one of them goes under the wall and ditch of our city, and has a secret outlet at some place in the surrounding country where there was formerly a wood."

My curiosity was piqued to see something of these passages, and, having procured fresh lights, we selected one of them and entered. It was narrow and well rivetted with brick. After walking four or five hundred yards we came to a place where the ceiling had been repaired and covered with plaster, on which the workmen had marked the initials of their names while the plaster was wet and added a date of 1592. About fifty yards further on were two reservoirs, made on either side of the wall, for the purpose of holding water in which fish might be kept alive for the maintenance of those who had taken refuge here. The passage afterwards went about a hundred yards further on until it was stopped in front by a solid rock. Up to this point it was nearly straight, horizontal, perfectly dry and in good repair, but on arriving at the rock it turned round, at right angles, and had only one side rivetted, the rock forming the other side. Here it became lower and very irregular in width, and, after pursuing it for about forty or fifty paces further, we were obliged to stop in consequence of the mud which had been caused by the land-water draining through the rock, and which, the further we went, got deeper and deeper and extremely inconvenient to us. We returned therefore towards the daylight, and although in retracing our steps I observed passages shooting off in different directions I did not attempt to explore any of them, for my guide not only confessed his inability to tell me where they led, but assured me that there was no one in the city who knew more on that subject than himself.

The Nuremberg Virgin.

But the Virgin, for I had neither forgotten nor abandoned her. After what I had seen there was no reason to believe that the humanity of the ancient magistrates of Nuremberg would have been particularly abstemious in employing her, however completely disconnected they may have been with the predatory gentry of the surrounding country. The Virgin was nowhere to be found in the vaults of the town hall, and, according to my guide, she had never been there. He said, however, that he had frequently heard that such a machine had been formerly employed, and that he recollected that the women, when he was a boy, used to still their children by saying to them, "I'll give thee to the Virgin." I asked him whether he thought it was in the Froschthurm, but he answered me positively in the negative, and said that he did not believe there was any place near the Sieben Zeiler where it could possibly be deposited. "But," added he, "if you wish to know anything particular about such a matter you had better go to Dr. Mayer, who is the keeper of the archives; he can tell you more about such matters than any one here." I went to him accordingly.

Dr. Mayer told me that the passage from the chronicle

quoted by Siebenkees was no fable, that the machine had formerly stood in a vault near to the Sieben Zeiler, and that he himself had seen part of the machinery which belonged to it, although the figure itself had disappeared. "The figure," said he, "stood at the brink of a trap-door, and when the individual who had suffered by its embraces was released from them, he fell downwards through it on a sort of cradle of swords, placed in a vault underneath, and which were arranged so as to cut his body into pieces, which dropped into running water over which the machine stood." He could not tell me the precise manner in which this machine operated, but said that he understood it to have been thus: two wooden cylinders were placed parallel to each other, so as to extend right across the inferior vault; into the front of each of these cylinders were screwed a great many iron blades, which projected in the face of each other, and crossed each other like scissor-blades; and into the rear of the same cylinders were screwed an equal number of curved bars of iron. The cylinders, being thus armed, were put in equilibrio by means of weights and by placing the ends of the bars on strong beams, so that, when anything heavy fell from above on the blades, they were put in motion, and made to perform a cutting movement. I need not say that in this manner the body of a man must have been soon minced to pieces.

Desirous of seeing the spot where the Virgin stood, I procured permission to visit it from the city architect, who sent me the keys by a man named Kiefer. This man had been a long time in the employment of the magistrates, and he accompanied Dr. Mayer and myself to the spot in question. He was a stranger to Dr. Mayer, but he had himself, many years back, been in the vaults whither we were proceeding, and he gave me an account of what he had seen there, which corroborated perfectly that which I had previously heard from Dr. Mayer; and he added that, having descended into the undermost vault, he found the two beams yet remaining, and that there were holes in them into which the blades, with which they were formerly furnished, had been evidently screwed. He found no stream of water there, although the place was extremely wet and damp; and on one side of the vault, which was drier than the other, there was a sort of grave in which were many human skulls and bones. I asked him whether he had ever known anyone who had seen the machine in a perfect state. He answered me in the affirmative, and told me that, in his youth, he had known an old man named Kaiferlin who had seen it so, and that he had heard from this person that there was formerly a stream of water which flowed through the lower vault. He stated also that this Kaiferlin told him (and I beg the reader's attention to this fact) that two or three days before the entry of the French into Nuremberg, the Virgin and all the instruments of torture formerly kept in the place where she was were taken away by night in a cart, and that neither she nor they had ever been heard of since.

(*To be continued.*)

CHURCH BUILDING AND RESTORATION.

Sudborough.—Works of restoration have been carried out at All Saints' Church, under the direction of Mr. J. C. Traylen, of Stamford, diocesan surveyor. The work carried out has been the entire reroofing in oak of the nave, the south transept and south aisle; the reslating and underpinning of the north transept; the rebuilding of the south-east angle of south transept, and the replacement of one of the four pillars of the nave. The tower has also been reroofed, the battlements raised, the pinnacles (of late date) renewed and the walls repaired. The body of the church has been refloored with wood-blocks and made level with the stonework of the nave and aisles and new oak seats placed in the nave. The church is lighted with lamps from the design of the architect and supplied by Messrs. Ellgood Bros., of Leicester. The contractors for the work were Messrs. E. Roberts & Son, of Weedon.

Dublin.—The foundation-stone of the proposed new façade in Halston Street of St. Michan's Catholic church, North Anne Street, has been laid. The new façade will be in accordance with a handsome design in Gothic architecture by Mr. George C. Ashlin, and the other work in connection with the design will, it is estimated, cost about 3,200*l.* The old parochial house has been removed, and the old church will be enlarged by 30 feet. On the Halston Street side it will afford additional sitting accommodation for 200 people. The façade will comprise a chancel 62 feet wide, an embattled tower 86 feet high, with a turret reaching a height of 110 feet. Alderman Toole has taken the work in hand. The walls will be of ashlar, with the masonry in picked Finglas limestone. The dressings, window-tracery, mullions and door-jambs will be in chiselled Kilkenny limestone. There will be two entrances from Halston Street to the sanctuary. The chancel will be lighted by a perpendicular Gothic window of six bays, with transoms and elaborate tracery. The window of the chapel, tower and bell-chamber will be of two bays with tracery.

Bladon.—The church of St. Martin has just been reopened after renovation and enlargement. The architect was Sir Arthur Blomfield, A.R.A., whose designs have been carefully carried out by Mr. Alfred Groves, of Milton-under-Wychwood. In place of the former plain, if not ugly, structure, there is now a beautiful church.

Selattyn.—The foundation-stone of a north aisle to be added to the ancient parish church has been laid. The aisle will be divided from the nave by an arcade of four bays. The roof will be covered with red Ruabon tiles. The stonework will consist of local stone, with red Shelvock stone dressings. The work is being carried out from designs by Mr. Hodgson Fowler, of Durham, by Mr. R. Yates, of Shifnal, the clerk of works being Mr. T. A. Bolton.

GENERAL.

Mr. H. S. Marks's picture of *A Select Committee*, exhibited at the last Royal Academy Exhibition, has been purchased by the Liverpool Corporation for the permanent collection of the Walker Art Gallery.

The Prince Regent of Bavaria has confirmed the nominations of MM. Bouguereau and Oscar Roty, the French painters, as honorary members of the Münich Academy of Art.

An Exhibition of Water-Colour Drawings by Turner, lent by the Trustees of the National Gallery, will be held in the Ruskin Museum, Sheffield, during next month.

The New English Art Club will open the Winter Exhibition on Saturday, the 28th inst.

A Mosaic, attributed to Orcagna, has lately been placed in the Italian Court of the South Kensington Museum. The subject is the Birth of the Virgin, the panel being from the right-hand lateral doorway of Orvieto Cathedral.

A Brass Pulpit, designed by Sir Arthur Blomfield, A.R.A., has been placed in Burghclere Church as a memorial of the late Earl of Carnarvon.

The Dundee Fine Art Exhibition will be opened on Saturday by the Marquis of Lothian.

A Stained-glass Window in memory of the late Charles Carmichael, architect, has been unveiled in the east parish church, Aberdeen.

Mr. P. H. Rathbone on Tuesday gave a lecture in the Rotunda Lecture Hall at Liverpool on "Art as a Necessity of Civilised National Life." Before concluding, he alluded to the architecture of St. George's Hall, the value of the edifice to the town, and how that value would be increased if the hall were completed.

The Candidates for the chair in the Académie des Beaux-Arts, rendered vacant by the death of Elie Delaunay, are MM. Edouard Détaille, Jules Lefebvre, Joseph Blanc, Aimé Morot and Luc-Olivier Merson.

The Important Architectural Competition for the new National Bank, Pretoria, South Africa, has been recently decided, and the plans sent in by the firm of Messrs. Frank Emley & Frank Scott, architects, Pretoria, have been placed first.

The American Institute of Architects have adopted a silver button bearing the letters A. I. A. as a badge of membership.

The Edinburgh Architectural Association held the opening meeting on Thursday, when Mr. John Kinross, president, delivered his inaugural address.

The Restoration of Llangwyfan Church is proposed to be carried out under the direction of Messrs. Arthur Baker & Hughes, architects, of Bangor. The building is at present roofless, but the walls generally are in good condition.

The Surveyors' Institution meet on Monday, the 23rd inst., when Mr. J. R. Adams will read a paper on the "Title to Land, its Registration and Transfer."

Lord Burton has offered to the Corporation of Burton-on-Trent a block of buildings, comprising St. Paul's Institute and a club, for municipal buildings. The block is the finest in the borough, and was built by the late Mr. Bass, at a cost of between 30,000*l.* and 40,000*l.* The offer has been unanimously accepted. Views of the buildings have appeared in *The Architect*.

An Appeal is made by the committee for funds to erect a memorial of Lieutenant Walter R. Pollock Hamilton, V.C., and those who fell with him at Cabul in 1879. The group by Mr. C. B. Birch, A.R.A., exhibited at the Royal Academy in 1880, now lent to the Museum of Science and Art, Dublin, representing the young officer, with his sword in the right hand and his revolver in the left, striding over the body of a prostrate Afghan, is considered by the committee to be such a fine work of art, a remarkable likeness and excellent rendering of the tragic murder of the English Embassy at Cabul, that it has been decided to commission the sculptor to carry out the work in bronze and have it erected in Dublin. The cost is estimated at 2,000 guineas.

The Architect.

THE WEEK.

IT would be advantageous if local authorities in England would attend to a judgment delivered in Edinburgh whenever they send out notices demanding that works of pavement should be executed in front of houses. The case in question related to a corner plot in Edinburgh. The owner was required by the Corporation to pave the streets on both sides. He contended that the frontage of his property was on one side only, and he should not be considered as having any responsibility on the other side. He also maintained that the notice was not sufficiently specific, and that the time allowed for the works was inadequate. The Court of Session rejected the former plea, and held that he was owner as regards both streets. With respect to the notice the Court said that the magistrates had acted upon the theory that all they had to do was to serve notices, which amounted to nothing more than a reminder to the proprietor of the terms of a section of an Act of Parliament. The notice told him that the street must be properly levelled, made up, constructed, paved and completed, but as to the manner in which the proprietor was to set to work the notice was absolutely silent. They had to consider, having regard to the alternative provisions for obtaining that the streets should be paved or causewayed, whether that was adequate compliance with the requisition or notice. It was to be observed that the statute contemplated that the proprietor was personally to be apprised of what the town called upon him to do at his own hands, and then failing his setting to work and meeting their requirements, they might do it themselves. His lordship took it that, according to the statutory provision, a proprietor was entitled first of all to learn from the magistrates what they required him specifically to do, and then he was to consider whether he could himself conveniently do that at his own hand; or whether he was not to do it, and let the second alternative of the section come into play, under which the magistrates would do it at his expense. Therefore, he thought the magistrates were bound to give, not a minute detail of the work to be done, but a sufficient indication, so that the proprietor might have the advantage of this alternative. He was clearly of opinion that these notices were bad, and that the Court ought on that ground to sustain the appeal.

THE roll of the Royal Hibernian Academy has been reduced by the deaths of three prominent members. The work of the Hon. LEWIS WINGFIELD was mainly known in England. Mr. JAMES FARRELL belonged to a family of sculptors who for many years have produced excellent portrait statutes and figures of saints, which are to be found in many Irish churches. Mr. COLLES WATKINS was the foremost of the Irish landscapists. There could be no question of his ability, and in England he would have gained fame and profit. But there was a fascination in the wild landscapes of Ireland which he could not resist, and since GEORGE PETRIE passed away he alone may be said to have caught the character of the scenes. The sadness, which is their chief characteristic, was heightened by him in many a representation of the country as it appeared in autumn. He was, in fact, a victim to his art, for during the recent gales he was chilled in one of the wildest parts of Kerry which he selected for this year's work, and suffered in a cabin far from medical aid. Mr. WATKINS was about sixty years of age, and for two-thirds of his lifetime his works were the main attractions of the exhibition of the Hibernian Academy.

THE polemic aspects of Mr. CALDERON'S Academy picture, *St. Elizabeth of Hungary*, seem to be endless. It might be said that the work has a political significance, for it formed the principal topic in the address which the Marquis of LOTHIAN, the Secretary for Scotland, delivered at the opening of the Dundee Art Exhibition on Saturday last. His lordship said that in speaking of that picture he might refer to it almost as a typical picture of what should and what should not be done in the way of pictorial art. To his mind—he had no doubt many of them had seen it and knew it—it was a most beautiful representation of the most perfect act of self-abnegation drawn or imagined by a painter. There was nothing in it to excite any feeling except that of reverence; it was beautifully painted; it was a work of art in every sense of the word, but it also had a defect. That was the good side of the picture; but it had another side, and this side he thought ninety-nine people out of every hundred would agree with him that the historical aspect of that picture was not true, and that the artist had been mistaken. That was one thing which he thought art should not give way to, however great the temptation might be to give way to such a feeling; and the other mistake was that it had certainly given rise, justifiably or unjustifiably, to feelings of regret among a large number of our Roman Catholic fellow-subjects in this country. While he looked upon it as a typical picture—a picture which had in itself and in its essence everything that was beautiful and noble—it had these two defects, the one that it was not true, and the other that it had given justifiable offence. But his lordship did not point out how a painter was to anticipate that his painting would give offence. We hope the Marquis of LOTHIAN does not adopt that principle as a rule of conduct, for if it be necessary to avoid giving offence the only escape open to an honest man is through suicide.

THE committee having charge of the grounds and buildings of the Chicago Exhibition announce that the preliminary estimates of the cost of the work are entirely inadequate to such an undertaking as the people of the United States expect to be produced under national auspices. The classification comprises exhibits on an enormous scale in departments that have heretofore either been ignored or lightly treated in great exhibitions, or made the subject of special exhibition at great expense. It is anticipated that in 1893 all branches of human industry will be included on a complete and comprehensive scale. This requires that each department should have for its installation a building and grounds such as has been previously considered unnecessary or impossible. The area embodied in the grounds will be nearly three times that of the greatest exhibition heretofore held. The separate departments of agriculture, electricity, mines and mining, horticulture and transportation especially, will each be developed on an unprecedented scale. The scope of the exhibition has grown with the progress of the works, and consequently a much larger expenditure must be anticipated. For the completion of the buildings, machinery, decoration, administration and maintenance, a sum of over twelve millions of dollars will have to be provided, organisation will cost about three and a half millions, and police, watchmen, &c., will cost one and a half millions. There are other means of outlay, and the exact sum to be expended in order to have the exhibition ready is put down as 17,825,453 dols. Unless the money is provided there must be an abandonment of some of the contemplated features.

THE old tower in Saragossa is doomed. It was erected four centuries ago, but it is still, as on its first day, the Torre Nueva. As an example of Spanish brickwork the tower is interesting enough, but to its inhabitants its importance consists in its rivalry to the Pisan structure. The Torre Nueva cannot, however, be treated as a builder's freak. If there is a departure of 9 feet from a perpendicular line it is owing to the sinking of the foundations. Cases of settlement are generally chronic, and there can be no doubt of the symptoms which are to be observed in the tower. It menaces the people who are so proud of its renown. Although it was restored thirty years since, the ground could not be made firm, and owing to the subsidences the tower was never in a worse state than it is now. The commissioners who have charge of the ancient buildings in Aragon have met and considered the reports of the architects, which state that it is no longer feasible to make the tower secure, and that the safety of the public makes demolition inevitable. But the commissioners have affection for the tower, and instead of approving of the operation they have implored the advice of the Academy of St. Ferdinand, in Madrid. But a Spanish savant needs a long period of time for deliberation, and unless an accident should occur, the tower may be visible for many months or years. The faith of the custodians in its stability continues unchanged, for they allow people to ascend to the upper platform.

THE CONVENTION OF AMERICAN ARCHITECTS.

THE Convention of the Architects of the United States, or rather of members of the American Institute, which was held during the last days of October, in Boston, was not remarkable in its proceedings, but as countries and men who have no wonderful histories are generally the happiest, the results of the twenty-fifth convention may be satisfactory to all who attended it. The president for the year was Mr. R. M. HUNT, of New York, an architect who has gained the confidence of his countrymen, and from his studies in Paris he is entitled to be considered as a representative of architecture in general. If it were not for the rule which allows only two years' occupancy of the chair, it would be well to utilise his services as long as possible. The first recommendation of Mr. HUNT related to the chapters. There has been much "high-falutin'" talk about the Institute as a sort of sublimated body that could lead an independent existence and yet perform wonders. In fact, from what has been said occasionally, it might be imagined that there was a sort of imperial condescension in accepting aid from the chapters. Mr. HUNT is too honest and clearsighted a gentleman to sanction such delusions, and he told the Convention that the life of the Institute was dependent on the vigour of the chapters—without their help little, if anything, could be accomplished. He therefore suggested that candidates should not be eligible for election to the Institute unless they were members of a chapter. Mr. HUNT also advised the exercise of aggressiveness occasionally by the chapters, and to be "ever ready to expose any scheme which, if carried out, would prove detrimental to the public good." Experience, however, shows that in America, as in Europe, the motives of architects are suspected on such occasions, and if they are eager to gain an end, it is more prudent to remain in the background. In their art the architects can assert themselves, and it is satisfactory to find from a judge so competent as Mr. HUNT saying that marked progress in design and construction is everywhere to be observed. In dealing with competitions the citizens are becoming more earnest about securing fair play, but as yet the discreditable practice of disregarding limited competitions has not died out, for uninvited architects send in designs; and the President was not too severe when he said that such action is injudicious and undignified, and tends to lower the profession. It is not surprising that when examples of sharp practice occur, architects in America who respect honour should long for the conditions of practice in Europe, which are imagined to be according to a righteous code. But in Europe there are also professional men who are never happier than when they deprive other architects of anticipated commissions, and who believe that competitions are to be gained mainly by trickery. The American architects have, as Mr. HUNT pointed out, more opportunities for practice and far more freedom in design than is allowable in Europe, and it cannot therefore be said they are without compensating advantages for the low commercialism that is degrading the profession. With all its drawbacks, the President was warranted in saying that "for centuries no fairer field has been offered for the display of architectural talent" than America.

As was to be expected from his association with the enterprise, Mr. HUNT devoted a part of his address to the Chicago Exhibition. The Advisory Board recommended, in preference to competition, a direct selection of architects for the principal buildings, but it was laid down that the gentlemen selected were to meet in conference and agree upon a general scheme of procedure. It is to be hoped that the arrangements will not be taken as precedents, for they do not correspond with ordinary practice, and the architects were restricted to office-work. According to Mr. HUNT, each architect was merely "required to furnish a general design, one set of full and complete general working drawings, and full details of all work of an artistic character connected therewith, together with such descriptions and instructions as might be necessary to elucidate fully his views as to construction and treatment, and everything relating to the construction and stability of the work was delegated to the Bureau of Construction." If the accounts which American newspapers publish are to be trusted, the Bureau's manner of construction is rather vagarious, and the materials already are exercising independence in various ways. But about those freaks Mr. HUNT was silent. He was not afraid to say that buildings of excessive height are detrimental to public health because they shut out the light and air and are injurious to the surrounding property.

The annual report of the directors described the position of the Institute (which is held in common with all architectural societies) by saying "the Institute can only recommend, cannot force upon its individual members or their clients its ideas of what constitutes good professional practice." One of the recommendations given was that there should be a written contract between an architect and his client setting forth the extent and limits of their responsibilities. With respect to competitions, which everywhere seem to create grievances, the directors begged the members to do all in their power, by precept and example, to discourage the practice of submitting sketches gratuitously or for inadequate remuneration. They were also advised to avoid all competitions of which the terms were indefinite and the awards were not satisfactorily guaranteed. Unfortunately, the American people are as indifferent as the English about the recommendations and proceedings of architectural societies. One proof is seen in the discontinuance of the committees on national buildings and architectural practice, "because of the deplorable, but quite apparent, want of interest of the public and our profession in these matters of such great importance to both." Competitions will therefore be likely to be conducted as irregularly as heretofore.

There are many other committees of the Institute that might without any apparent loss be also discontinued. The members do not appear to be acquainted with the English way of having "much ado about nothing," or it may be the American architects are not disposed to devise useless work to display their activity. At any rate, on such subjects as education, professional ethics, clerks of works, uniform contracts, conservation of public buildings, the American architects must contrive to prosper without further enlightenment. The President said, "Our committees have not been very active during the past year," but no architect at the Convention was able to state that even an office-boy suffered in consequence of the cessation of meddling during the year.

The scorn of trade and business which prevailed among the "best society" in England in the days before limited liability levelled distinctions has, like other cast-offs, found its way across the Atlantic. It will hardly be credited that the most important resolve of the Convention was the following:—"All architects who shall have been actively engaged in the honourable practice of their profession for ten years or more, and shall then have retired from active practice, *and who shall not have engaged in any business or trade*, may retain the rights and obligations of fellowship." It is not easy to understand why a society of architects should care about men who no longer practise, or why the latter should be eager to assume the obligations of fellowship which, of course, means punctual payment of subscriptions. An architect who becomes director of a trading company must pass under the ban of the resolution, as well as all who take shares. Architects who design for manufacturers will also be excommunicated, and, to be logical, the punishment should fall on those who design manufactories. Yet the members of the Institute who are so ready to show contempt of their families are pained because the inhabitants of a nation that lives by trade and business do not esteem them. Such affectation of superiority would be absurd in a girls' boarding-school, and it is pitiful to find grown men are not ashamed of taking part in an attempt to go beyond the restrictions of the caste system. But what is to be expected from those who imagine that a receipt for a subscription to the Institute is a "passport to good society"?

It might be supposed that the members who can employ the time of the meetings with childish discussions, for everybody seems to be disposed to exhibit a forgetfulness of good sense, are without important subjects which require serious consideration. But that is not the case. One of those subjects relates to the designing of Governmental buildings. In America the supervising architect is respon-

sible for more buildings than all the surveyors of the English Office of Works. The work is so onerous that of late years it is beyond the powers of any individual, and the holder of the office at the present time has tried to have some of the buildings made the subject of a competition. But in Congress there is no desire for a change, and there is opposition from underlings, who somehow possess influence. One architect who has tried to bring about a reform said:—"We found opposition from the many hangers-on of that office, and this kitchen back-door influence is very strong in Washington." The only way to insure a change is to operate on the individual Congressman, and all the members of the Institute have undertaken the mission. But the votes the Institute can command in any district are so few they are not worth considering as a political factor, and the Congressmen respect people in proportion to their influence. Having assumed that a trader or a man of business is unworthy of mixing with the members of a profession that is without legal status, the American architects must expect that efforts will not be made to increase their commissions by the representatives of trade. They have assumed superiority and must abide the consequences.

Many other instances of unwise action can be found in the history of the Institute. The result has not been fatal to art. Architecture has advanced without any aid from the Institute as an organisation, and as that fact is patent, why should Congress or any other authority in the States be moved by the talking, voting, dining and sight-seeing of conventions?

LEEDS ARCHITECTURAL SOCIETY.

ON Monday evening the sixteenth session of the Leeds and Yorkshire Architectural Society was opened with an address by Mr. W. H. Thorp, F.R.I.B.A., who had been re-elected president, at the Law Institute, Albion Place, Leeds. He remarked, the *Leeds Mercury* says, that they had completed the first year of their alliance with the Royal Institute of British Architects, and had thereby, to his mind at least, materially strengthened their position, not only as regarded themselves as a society, but they had also further justified their being in the eyes of the public. Times had been fairly prosperous, and there were few, if any, of their practising members who had not been favoured with commissions of a more or less important nature, the results of which would doubtless add to the architectural beauty of the town and county with which they were so closely associated. On other occasions he had so often dwelt upon the advantages to be derived from a study of good examples of architectural work, in the cultivation of taste and the preparation of a basis upon which to rear a superstructure of architectural knowledge and the principles of design, that it was hardly necessary for him to further enlarge upon them. If any proof were required of the desirability of this course of study, it was only necessary to think for a moment of the more brilliant members of the profession now engaged upon the design of the best examples of contemporary art, who had all, without exception, been devoted and enthusiastic followers of this branch of interesting work. Hand in hand with the artistic side of the architect's calling, the scientific claimed its due share of attention, and must by no means be neglected in favour of its more fascinating sister. He was glad to know that many of their students largely availed themselves of the classes for the study of science bearing upon the constructional part of their work that were held at the School of Art, the Yorkshire College, and other centres of technical education, and were thus acquiring valuable knowledge, which, in addition to the excellent mental training which they afford, would prove of infinite value in solving the problems which are met with continually in ordinary office work. The President then proceeded to consider the question which had created a large amount of discussion and warmly-contested argument during the past year, namely, "Architecture—an Art or a Profession?" He thought the impartial critic could not fail to admit that architecture had a twofold aspect, and to exalt the one at the expense of the other was to inflict injury on both. Noticing next the International Congress of Hygiene and Demography held in the metropolis in the month of August, at which he and Mr. W. Carby Hall, the secretary, attended as delegates, Mr. Thorp gave a brief report of the transactions of the congress from an architectural point of view. At one of the sittings of the Architectural Section, he remarked, an animated discussion took place on the merits—or rather, he should say, the demerits—of "back-to-back" houses, and great surprise was expressed that in an important town like Leeds such dwellings should be permitted. It was hardly necessary to mention that the opinion of the meeting was in direct opposition to the further erection of dwellings of this type, and a resolution to that effect was carried by a large majority. Whilst upon the subject of hygiene, and remembering that sanitation had been so much to the fore of late, he would mention that the Yorkshire College had succeeded in establishing a lectureship of "Sanitary Science," and Mr. Spink, civil engineer, of Manchester, had been appointed to that post. They would recollect, a year ago or thereabouts, in considering the question of architectural education, the council of the college were approached with the request that they should provide instruction in sanitary science, and also arrange for efficient scientific teaching as to the use of iron and steel in building structures. As regards the former subject, doubtless a similar request was made by other societies interested in the subject, so that they could hardly claim the honour of taking the lead in that beneficial movement, but at all events they had had an important share in it, and had shown their interest in the practical shape of a grant of ten guineas from the funds of the society in aid of that new venture. It might be he would be accused of blowing the society's trumpet in calling attention to that fact, and if that be the case the consequence must rest upon his shoulders; but he did so with the express desire that the public should be made aware that the architects of Leeds were by no means indifferent to the importance of the question, and that they would give all the encouragement they could to the furtherance of a knowledge of the principles of sanitary science and the laws of health. They would probably remember that a year ago, on the occasion of his last presidential address, he took the opportunity of making a few remarks as to his views upon the published design for the Leeds new Post Office, and in doing so was not able to speak altogether in its favour. It was not his wish in any way to reflect upon the ability of the architect to the Department, who was probably hampered by considerations of expense in his architectural treatment of the building, and thereby had been unable to do justice to the fine opportunity placed within his reach; on the other hand, knowing the inhabitants of the town, after exercising their patience for many years, were expecting a beautiful edifice to take the place of the Old Cloth Hall—a building of no architectural style and renowned for its ugliness—he felt justified in questioning whether the design if carried out as an example of architecture would take its due place amongst the finest buildings of the town, and be worthy of the splendid site upon which it was to be erected. The sentiments then expressed appeared to be in accordance with the general feeling in the town. The question was taken up by the Borough Council and the Leeds Chamber of Commerce, and their desires, together with those of the society, for a reconsideration of the design were forwarded to the Department in London. He alluded to the deputation which waited upon the late Postmaster-General with reference to the subject, and to the revised design which was afterwards forwarded to the Leeds Corporation for approval, remarking that upon inspecting the drawings they found that although a good deal of similarity existed between the old and the revised proposals, a material improvement had been effected, and a more dignified and monumental character imparted to the building. One or two of its features still gave rise to comments not entirely of a favourable nature. These were noted, and suggestions were made for their improvement. Reviewing the circumstances of the case, he thought they had reason to be satisfied with the action taken by that society and the other bodies with whom it had been associated in the movement; and, should the new Post Office not quite come up to the ideal of their expectations, they would feel it had not been from any lack of effort on their part to improve the architecture of the town. The square opened out by the demolition of the Old Coloured Cloth Hall had now been cleared, and when the Quebec property was removed the finest improvement that Leeds had seen for many years would be an accomplished fact. Bounded on its eastern side by the picturesque group of Gothic buildings formed by the Royal Exchange and Mill Hill Chapel and Schools, on the south by the classical frontage of the Yorkshire Banking Company's Bank, and on the west by the new Post Office, the square should not be without architectural attractions. It now only remained for the Midland Railway Company to improve the approach to their station, and for the old Court-house on the north either to be purged from its excrescences or to give place to a more modern erection to complete the surroundings of this fine open space. But there was another square to which he wished to draw their attention, that bore the name of their most gracious Sovereign Lady, Queen Victoria. The square itself he was not going to find fault with, although he was no admirer of its cast-iron fountain, and he could wish the statue of Wellington was balanced on the western side by a similar monument to some other well-known celebrity. Nor was it Cuthbert Broderick's masterpiece, which dominated its northern side, which called for any but favourable criticism on his part; for notwithstanding the fact that it was thirty-three years since the Town Hall was opened by the Queen, it was still, without exception, the finest building which

Leeds possessed. But what could be said in favour of its neighbours on the south and west sides of the square, and could it for a moment be asserted that they were calculated to produce feelings of admiration on the part of the spectators? It would perhaps be unwise of him to single out any particular building as more worthy of condemnation than the others, but it would be a pleasure to see the College of Music rejoicing under a more attractive exterior and the outer shell of the Oxford Place Chapel transfigured into "a thing of beauty and a joy for ever." Were it determined to raze some of these offending structures to the ground and in their place erect some buildings worthier of the position, he did not think the Thoresby Society would waste much time on unavailing lamentations or the Society for the Protection of Ancient Buildings organise a crusade in their defence.

After remarks by Mr. Hart (Wakefield), Mr. G. B. Bulmer moved a vote of thanks to the President for his address. Referring to the new Post Office, he remarked that it was a great thing for their society to be able to say that it had been invited to take part in the matter, and that the representations which it had the pleasure of making before the Postmaster-General had been effectual in giving them a distinct and substantial improvement in the character of the design for the Post Office.

Mr. E. J. Dodgshun, in seconding the resolution, said the President had alluded to Victoria Square and to some buildings which he would like to see replaced.

Mr. W. Watson (Wakefield), in supporting, thanked the members of the Association for electing him a member of the Council.

ARCHITECTURE—A PROFESSION OR AN ART?

THE following letters have appeared in the *Times* in succession to Mr. Norman Shaw's already published, and to one by Mr. Woodward:—

Mr. W. White, F.S.A.

I for one am not disposed to quarrel with Mr. Norman Shaw for his high view of art, but I think he unfairly depreciates the endeavour of the Royal Institute of British Architects to enable all its future members to exercise their "art" successfully, and without bringing it into discredit by want of that further branch of culture needful to enable them properly to fulfil their duties to the public as constructors and scientists. The Institute does not profess to manufacture artists, or to cultivate, or to test, art by its examinations, but merely to insure the acquirement of all those elements of construction and arrangement without which the architect, whether true artist or not, must fail to satisfy the requirements of a civilised community. Amongst the elements which constitute the "artist" must be enumerated perception, memory, genius, sentiment, poetry and imagination. These qualities must be innate, though to some extent capable of expansion or repression by education. Without them the architect cannot properly be termed an "artist." But in addition to all these the architect needs a great deal more. He must be conversant with the higher forms of geometry and science generally. Added to genius he must have a large capacity for ingenuity, a fund of general information, and a considerable amount of what Vitruvius calls "Ratiocination." Without a full complement of these things perhaps a man may not be entitled to the name of architect. But the higher cultivation of them, through the efforts of the Institute, so far as they are capable of being imparted or tested, ought not to be set down as derogatory to the one body in England which aims at a higher standard of education than has for centuries been considered necessary to the architect. If the Royal Academy be content to teach the art of architecture *minus* certain essential elements necessary for its appreciation or practice, without which the art of architecture is practically a nonentity, let not the Institute's endeavour to teach these elements be set down as propagating mere professionalism, or for the cultivation of a business capacity; the absence of which, indeed, is no very great merit even in the sublime artist. When a man has obtained his diploma the public will soon discover whether he have or not enough of the artist in him to carry out their commissions. And doubtless there are some who might maliciously suggest it to be an ungracious act to attempt to saddle "t'other boy" with misleading the public, when the Institute aims at supplying an essential need in the education of an architect, which the Academy itself fails to attempt or even to promote.

Mr. T. G. Jackson.

Mr. Woodward, by way of reply to Mr. Norman Shaw's letter in your issue of the 11th, dresses up once more for public warning the lay figure of the "art architect," which has so often amused his brethren of the Royal Institute of British Architects. He represents him as a man who leaves his construction to the engineer and his business to the surveyor and the commission-agent, keeping the artistic part only for himself. The original of Mr. Woodward's dummy, however, never existed save in the imagination of himself and his friends. Mr. Norman Shaw and those who think with him certainly maintain that the pursuit of architecture has nothing in common with the business of the surveyor and commission-agent. Mr. Woodward thinks it has. We contend that if a man occupied himself with land-jobbing, negotiating ground-leases, floating building speculations, conducting arbitrations and deciding questions of light and air—matters which have as much to do with architecture as orange-planting in Florida—the dregs of his time which remain will never suffice to make him a tolerable architect. Mr. Woodward and the Royal Institute of British Architects think differently. And as to construction, it is quite true we maintain that mere skill in construction which is enough for the engineer will not be enough for the architect; but we do so not because we undervalue construction, but because we hold that architectural construction must be not only scientific but something more—that is to say, artistic. In our opinion good construction is a necessary condition of good architecture—*cela va sans dire*. Experience proves that the best architects are masters of construction; and though Mr. Woodward may not be what he calls an "art architect," but poses as "the practical man," he must forgive my doubting whether he is qualified to give a lesson in construction to Mr. Norman Shaw.

Mr. Woodward.

Two or three years ago Mr. T. G. Jackson gave a lecture to the members of the Architectural Association and preached the same pernicious doctrine which Mr. Norman Shaw again formulates, giving encouragement to the student of architecture to neglect the constructive and scientific parts of his professional education and confine himself more to what Mr. Jackson is pleased to term the "art" portion of his studies. I expressed at 9 Conduit Street on that occasion the same sentiments as those by which I am still moved, the danger to young men (many of them would be only too willing to get rid of the laborious part of their studies) being quite apparent. With reference to Mr. Jackson's letter in the *Times* of the 17th, may I remark that I never suggested that I was "qualified to give a lesson in construction to Mr. Norman Shaw"? But permit me to add that I have no inclination to go to either of them for lessons in construction or in any other branch of an architect's business. I yield to none in a sincere veneration and regard for art in its highest form, in music, painting, sculpture and architecture; but I cannot stand quietly by and see men riding off on the cant of art, kicking up as they go mud at that Institute which is doing its best to make the architect a master of his business in all its branches. Mr. Jackson accuses me of dressing up a "lay figure" and bringing forward a "dummy." I urged that the architect was in the habit of handing over, at the cost of his client, a great part of his functions to the "specialist." Now, will Mr. Jackson carefully watch my "lay figure" and see whether it moves or shows signs of vitality? Is he or is he not aware that the following important parts of an architect's business are frequently executed by the "specialist?" Is it true that:—

1. The whole of the drainage and sanitary works of the building are designed, drawn and specified by the sanitary plumber?

2. The whole of the constructional ironwork parts of the building are drawn calculated and specified by the building engineer?

3. The whole of the internal decorative wood and plasterwork is designed in detail and specified by certain decorative firms?

4. The whole of the painted decorative work is designed by the art decorator?

5. That, in order to produce these designs and specifications, the "specialist" is bound to employ a staff of clever and artistic draughtsmen, and that the cost of those men is added to the price of the work upon which the architect receives his 5 per cent., and which the client supposes that the architect himself has designed and specified?

Well, what is the serious outcome of all this, apart from the deceit practised upon the client? I say that the architect who so conducts his business goes upon the building utterly ignorant of what he should be thoroughly well up in, and would have been had he paid some attention to the work himself; he knows nothing about the "specification," he has lost touch completely with the building, and he is left bare in the hands of others, free to admire his own beautiful cut-brick ornament and his artistic terra-cotta panels. I do not think that a Wren, a Barry, a Smirke, a Pennethorne, or a Street thought as Mr. Jackson thinks; I rather believe that in their own offices, and not in the shops and offices of others, were the drawings made and the specifications written embracing the whole structure from foundation to finish. With all due deference to Mr. Norman Shaw and to Mr. Jackson—for both of whom I entertain feelings of personal regard—I prefer to stand by the definition of an architect as laid down by our immediate past president, Mr. Alfred Waterhouse, R.A., and endorsed by our present presi-

dent, Mr. Macvicar Anderson, viz. "an artist, a man of science and a man of business." I have more confidence in such a man as an architect than in the emotional, maudlin designer of original ugliness, household furniture, paperhangings and table-covers.

Mr. W. H. Seth-Smith.

It is clear that either the Royal Institute of British Architects, with its now well-established system of compulsory examinations for its own membership, is altogether on the wrong road, or that Mr. Norman Shaw and his friends, who memorialised the Institute against this system, are mistaken in their view that architecture is an art "on precisely the same footing as painting and sculpture." Those with whom I have the honour of being associated in the promotion of the movement for the legal examination of all persons calling themselves architects agree with the Institute, but desire to see the examinations made compulsory in future upon the entire profession, and conducted by a paid staff of examiners; and we further desire that the R.I.B.A., as the senior and leading professional body, should draft and introduce such a measure to Parliament. Now for our reasons for agreeing with the examination policy of the Institute. Mr. Norman Shaw is correct in stating that at the present time there are three branches of professional work performed by men calling themselves architects, and we perfectly agree with him in holding that the artistic qualification is essential to a proper claim to that title, but hold that the constructional side is inseparable from the artistic, and we are convinced that a well-balanced examination in both the science and the art of architecture will have the very, and very desirable, effect aimed at by Mr. Shaw, namely, of preventing men who are exclusively utilitarian constructors, or men of business, from using the title of architect. The tests imposed by the Royal Academy prove that it is possible and expedient to examine men in matters of taste, and I for one would not advocate any system of examination in architecture which excluded the test of the existence of a sufficient degree of designing power (and skill in representing ideas) to insure the public against such costly disappointments as are now only too terribly common.

As regards artistic specialism, we believe that it is impracticable to separate these three branches of practice, except in the case of a very limited number of men in the metropolis and large provincial centres, just as in medical science the vast majority of men are compelled to be general practitioners. In all such matters we have to consider the question, not in the light of its bearing upon a small class of men, but for the general good; and when a man has qualified by passing the general examination he can become a specialist either in art or in science. It is to be feared that the architect is, generally speaking, called in not so much to guide in matters of taste as to secure good planning, construction and sanitation, and it is in the exercise of his skill in these foundations of good architecture that he finds his opportunity for designing beautiful things, whereas the tendency of Mr. Norman Shaw's arguments is to reduce the architect to a mere decorator employed by the engineer or builder. It is a lamentable fact also that art has contributed next to nothing to the vast advantages which engineering construction has conferred upon the public, and the reputation of science has suffered proportionately among men of Mr. Norman Shaw's type. But, supposing that engineers had studied architectural art, and architects had imbibed something more of the bold inventive spirit of the engineer, our Empire would not be disfigured, as it is everywhere to-day, with grossly utilitarian erections on the one hand, and with ornamental plagiarisms, caricatures and deceptions on the other. We believe that such a union would have done more for architectural art than anything else could have done. The professor of architecture at the Royal Academy is perfectly right in saying that for the last 300 years architects have been groping in the dark, and that it is only in combination with constructional science that we can expect living and lasting progress in our art.

Mr. J. M. Brydon.

There can be little doubt that Mr. Norman Shaw and Mr. Jackson are in the right in their contention that architecture is an art, but where they seem to labour under a mistake is in supposing that the Institute is opposed to them in this conclusion. The Institute is not now proposing, and never has proposed, any restriction on any man becoming an architect; in point of fact it has steadily opposed, hitherto with success, all the efforts that have yet been made to induce Parliament to legislate on the subject. It has been insinuated that its action in this respect has been taken with the object of promoting some analogous scheme of its own. Nothing can be further from the truth, and it is as well this should be made known as widely as possible. An endeavour has been made—wisely or not may be a matter of opinion—to raise the standard of architectural education, but—and this should be made perfectly clear—the Institute grants no diplomas of architecture whatever. What has been done is simply this, to impose an examination for all candidates for associateship in its ranks. The wisdom of this is again a matter of opinion, but the examination qualifies for nothing at all save entrance to the Institute as an Associate, and carries with it no diploma of any kind. The student who passes it does not necessarily become a member of the Institute. Many do not; their names are simply printed in the list of those who pass, and afterwards, if they wish to join, they must be put up for election in the usual way. Now, there is a great and wide difference between a private society imposing conditions on those who seek admission to its ranks and the same society dictating terms to all who may prefer to work outside of it. Surely that must be obvious to everyone, and has nothing to do with the question whether architecture is a profession or an art.

I am quite aware that there is a proposal to extend the system of examinations to those who wish to become Fellows of the Institute, as well as to the Associates, but that in the meantime is only a proposal, and this is not the place to discuss it. In spite also of the special pleading in its favour in the President's opening address, it is nevertheless a proposal on which the "authorities" of the Institute are so hopelessly divided that there is little chance of anything of the kind being carried out for years to come, if at all, and even if it were it would only apply to men who may desire to join the Institute and could place no restrictions whatever on any one outside of it. But further, if Mr. Norman Shaw and Mr. Jackson and their friends outside the Institute who think all such examinations detrimental to the true interests of architecture as a fine art would, instead of writing acrimonious letters, come in and help their friends, and they are many, inside the Institute who agree with them in the main, the examinations they so strongly object to would be relegated to the Greek Kalends, registration cease from troubling and "professionalism" be set at rest. Can they not for once forget the claims of party, forget the little differences which must always exist among men even of the same calling and make one great united effort for the commonweal? Mr. Norman Shaw, Mr. Jackson and half a dozen other men one might mention could influence the whole policy of the Institute and give it an impetus which would be felt throughout the length and breadth of the land. It is no manner of use inveighing against the Institute; we must take facts as we find them, and the Institute is a great fact, existing for much more important ends than examining its would-be Associates. It is not perfect any more than the Royal Academy, especially to architects, is perfect, but it can be made better by a broad, liberal-minded policy, the very opposite of the narrow ways of examinations. Its future is not alone in the hands of those within, but also of those without. Mr. Shaw and his brilliant friends as representing the latter can do much—no men more—to help forward all progress that makes for the advancement of the art they love. May I appeal to them to come and help us? The result will proclaim their strength, as it will be their reward.

THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held on Tuesday, when Mr. G. A. T. Middleton read a paper on "The Society's Excursion into Belgium," in August last. As ample reports of the visit were published during its progress, there is no necessity to give a copy of the paper. Mr. Middleton, in conclusion, said the tour had been a success in every way, largely due to exceptional facilities given everywhere, and particularly by His Majesty the King of the Belgians; while it was felt that an important step in advance had been taken in thus securing the meeting of the architects of England and those of another country, a step which cannot but be to the interest of architects and architecture generally, securing to each country the advantage of the research and skill of the architects of the other. Of little less value, too, is the close intercourse engendered during such a tour between the architects of different parts of England, tending to a widening of sympathies and the unification of practice, while to all who took part in it the excursion must have left behind a feeling of pleasure only—a pleasant summer holiday, spent in pleasant company, and with a definite object in view such as gives the greatest zest to pleasure, apt to pall if sought for its own sake alone.

TESSERÆ.

An Ancient Thames Embankment.

IN the early part of March 1824, the clearing the bed of the river was commenced previous to the driving of the piles for the coffer-dams for the new London Bridge. This object was accomplished by means of dredging. In the course of the operation a number of miscellaneous articles were dragged up consisting of coins of the Roman, Saxon and early English era, ancient seals, a crucifix, brooches, gold rings (all of the

Middle Age), ancient daggers and swords, brass and iron keys, amulets, and a few implements of domestic use supposed to have been lost from the dwellings which formerly stood upon the ancient bridge. On the north-eastern side of the new bridge, now occupied by the stairs on the surface of the bed of the river, which consisted apparently of burnt ruins, were found between thirty and forty gold half-sovereigns and angels of the seventh and eighth Henries, and in the line of the river near the site of the chapel-starling was found a leaden seal or bulla, inscribed "P. P. Urbanus VI.," the reverse exhibiting the heads of St. Peter and St. Paul. In clearing away the crypt of the Prior of Lewes Inn in Southwark to form the new line of roadway another bulla was discovered in good preservation inscribed "P. P. Clemens VI." Many Roman coins were met with and a great variety of others of the Lower Empire. Saxon and English coins were found in great abundance. There was besides a great variety of jettons or counters of brass and other base metal, and many private tokens of tradesmen resident in the neighbourhood. The ancient embankment of the Thames showed itself on the northern side of the river. The exterior embankment next the stream was constructed vertically, and built with Kentish rag and Purbeck stone in courses and in a manner similar to the piers of the late ancient original bridge. It was backed by quantities of chalk and madrepore, the latter probably brought as ballast in vessels. Within this embankment for nearly 100 feet several small jetties forming docks and quays appeared, which were doubtless at some time landing and discharging places. Proceeding northwards the ground was found to be a mass of marsh extending from the river's edge about 300 feet onwards, evidently from its having once formed part of the bed of the Thames. It shelved up towards Thames Street, and was excavated from 10 to 20 feet deep at that part to find a safe foundation for laying the south abutment of the land-arch built across Thames Street. Here the first timber embankment was discovered, and was found about 10 feet below the surface of the ground. It was traced to the depth of more than 20 feet, and was formed of large solid trees of oak and chestnut about 2 feet square roughly hewn, having strong timber waleings spiked to the piles, the whole being of great strength and massive. The timber composing this embankment was perfectly sound. The second embankment was discovered about 60 feet beyond the north side of the Thames towards the site of Crooked Lane, and was of a completely different character from the one just described. It was composed of elm piles from 8 to 10 feet long closely driven together, and being further in shore than the former and of a totally different description, must have been constructed at some other period. It was in clearing away these old embankments and in going to an additional depth for the construction of the great sewer which runs through the centre of the new northern approach to the river, that a large quantity of fine red Roman ware was discovered at the average depth of about 18 feet below the surface, both plain and ornamented, together with fragments of Roman amphoræ, vases, tazzas, crucibles, lamps, bottles of glass, and one small pavement of red tesseræ. This last was found on the site of Crooked Lane about 10 feet below the surface of the street. A similar pavement was discovered on the south side of the river, near which were found Roman coins in good preservation. In the excavations crossing the line of Great Eastcheap an evidently Roman construction presented itself, which from its form and contiguity to Watling Street led to the conclusion that this must have been part of the celebrated Roman road. It consisted of two walls 7 feet 6 inches high, tapering a little upwards, built in rough courses of Kentish rag stone, and separated by two layers of Roman tiles, the latter two courses breaking joints and binding throughout the wall. The average dimensions of these tiles were 16⅔ inches by 11½ inches, and about 2 inches thick. These walls supported a raised bank or road about 16 feet wide, and stood upon a stratum of loam. Below this, to the depth of 20 feet, was found the hard native gravel which forms the rise of the land here; under this was the same species of blue or London clay which constitutes the bed of the river at this spot.

Roofing of York Cathedral.

York Minster affords a curious negative proof of the advantages and disadvantages of the stone vault. The latest architects of York, to whom we are indebted for the grandest interior in this kingdom, could not confine themselves to the usual limits of English cathedrals, and at the same time could not afford the immense additional expense of exceeding those limits in a safe legitimate way. They substituted a fabric of timber in imitation of a stone vault, which by its lightness admitted of greater width and a more elegant style of architecture, and by running up into the valley of the roof obtained an unprecedented height. In consequence of this, the choir of that minster, exclusive of the aisles, is about 20 feet higher and 6 or 7 feet wider than the average of that part of English cathedrals. People who have recently stood gazing with awe and wonder up that glorious vista are sure to feel disappointment when they enter the sister pile of Lincoln, or any other cathedral. They feel a want of space and height. The architect of York succeeded entirely as far as grandeur of effect is concerned. However, this was obtained at a great sacrifice. The timber imitation of vaulting, so far from being, like stone, any additional security against fire, increases the danger, by bringing near one another two complex frames of wood, two piles of fuel. When the incendiary Martin set fire to the choir, had the vault above been of stone, the organ and all the lofty stall-work would have blazed away like faggots in a baker's oven, and the fire would soon have spent its fury without doing any further mischief to the edifice itself but what a few buckets of whitewash would have set right. As it was, the first wreath of flame that reached to the wooden arch above spread like lightning through the roof, and made the destruction of the whole choir inevitable. Again, at a later time, the burning timber inside one of the west towers fell down to the floor, and would there have burnt out but for the inflammable nature of the vaulting over the nave. It is true that extraordinary precaution and watching may provide against such a misfortune (and certainly such a roof requires that they should never be intermitted), yet the fate of York Minster puts that style of roof quite out of question for the future. It also shows that any double frame of woodwork, such as that universally in use for the last century, containing an inner ceiling of lath and plaster, is more liable to such catastrophes than the single framework of an open roof.

Palimpsest Brasses.

The attention of every one who has been interested in researches into the sepulchral antiquities, either of the Classical or the Mediæval period, must have been called to observe the wanton recklessness with which the memorials of one generation have been displaced to make way for those of a succeeding age, and the materials appropriated to the purposes of the occasion. Numerous are the instances that might be cited where sepulchral brasses have thus been sacrilegiously perverted from their original purpose; indeed, among the limited number of memorials of this kind of which, by their having been detached from the monumental slab, the reverse can be seen, the number of those which are found to be engraved on both sides is proportionally so large, that it might be assumed that the greater part of our sepulchral brasses would be found, were it possible to ascertain the fact, made up of fragments of prior memorials of the dead. In cases of this kind the term Palimpsest Brass seems to be not an inappropriate designation. In the chancel at Hedgerley there is a sepulchral brass which represents Margaret Bulstrode, the wife of a gentleman of the family of that name formerly possessed of estates in several parts of the county. The inscription under her feet records October 1, 1540, as the date of her demise; her costume is the ordinary dress of the time of Henry VIII. Beneath are seen a numerous little family of ten sons and three daughters, and above the bearing of Bulstrode, quarterly with two other coats, impaling a single bearing, which would serve to identify the individual. The plate on which the inscription had been graven having become detached from the sepulchral slab, it was found that the reverse presented a memorial of a period two centuries anterior to the date of the secondary application; and fortunately, the piece of brass having required an addition of some inches in length, in order to receive the later inscription, the earlier has been preserved without mutilation. It consists of the following distich:—

Totyngton Thomas Edmundi qui fuit Abbas
Hic jacet, esto pia sibi ductrix virgo Maria.

This simple record, and the pious aspiration whereby it is accompanied, appear to have formed the entire memorial of the deceased Abbot of St. Edmund's Bury. There is no apparent reason for supposing that the plate had been reduced in size; but it must be remarked that the character seems to be of a time later than the demise of Abbot Totyngton, and the brevity of the memorial may have been owing to the circumstance of its having been affixed some years after his death, merely to mark the spot where his remains rested. Thomas de Totyngton succeeded John de Norwold in 1301; he had previously been sub-prior of St. Edmund's Bury, and he presided over that powerful and wealthy establishment during ten years. It was on November 4, 1539, that John Reve, the last Abbot of St. Edmund's Bury, surrendered his charge. From the reports of the Commissioners, gold and silver ornaments were appropriated to the amount of 5,000 marks. The discovery at Hedgerley is a fearful testimony as to the rapidity with which the work of spoliation proceeded, for the brass of Abbot Totyngton, which formed part of the spoils, was again turned to account for a memorial in the succeeding year. It is needless to mention numerous examples that are to be found of sepulchral brasses which, like that at Hedgerley, have been employed for a secondary purpose. In some instances, the design that is found on the reverse may have been rejected on account of some defect of design or workmanship. A curious example of this kind occurs at St. Margaret's, Rochester, where the representa-

tion of a vicar of the church, who died in 1465, is found on both sides of the plate, the only difference being slight variations in the ecclesiastical costume, the first having evidently presented some impropriety in that respect, for which it was cancelled, and the figure given in due form on the other side. A similar example is afforded by the brass of an ecclesiastic at Burwell, Cambridgeshire. Palimpsest brasses are also found at Berkhampstead, at Cuxton, Kent, and St. Peter's in the East, Oxford, an account of which was communicated by Dr. Ingram to the *Gentleman's Magazine*, 1841. There are likewise two at Isleworth, one of which exhibits on the reverse Flemish words, engraved in a peculiar character used in sepulchral memorials in the Netherlands. As brass plate was exclusively procured from the Continent until works were established for its manufacture in England in the seventeenth century, it may be readily understood how this portion of a memorial, which had either been cancelled by the engraver or suffered desecration, should have reached this country. At Bromham, in Bedfordshire, are fine brasses representing Thomas Wideville, who died about the year 1435, and his two wives, in the costume proper to the times of Henry VI. These, by an extraordinary reappropriation, have been employed a hundred years later to supply a memorial for the descendant, in the fourth generation, of the sister of the individual for whom they had been originally designed, namely, for Sir John Dyve, who died in 1535, his mother, and his wife. This curious monument has been engraved for Lyson's "Bedfordshire."

Limitations of Glass Painting.

All productions of art are properly subject to two restrictions—the nature of their materials and the nature of the human eye. In glass painting we have to do with an art which is especially connected with those of architecture and of picture: with the former as an adjunct and ornament; with the latter as a sister art of colour and design. The nature of glass itself differs from anything else that those arts have to do with. Both these arts are based on definite principles and bound by definite limitations. Let a picture be black as night or fresh as morning, severe or sketchy, it will be good only if it have not transgressed the laws of chiaroscuro, of transparent and opaque colours, of colour in relation to light and shade, and of texture in relation to proximity or distance, and of linear and atmospheric perspective. Those involve principles that are inviolable, and beyond those limitations no good work ever was or ever can be produced. They are the natural laws of the materials in relation to the eye. The other art, architecture, whether Classic, Gothic, modern, or aught else, has equally its laws and limits. It cannot without ruin transgress the powers of its own materials, nor can it, without offence, violate that science of numbers (the very soul of art, including that of music) which we call proportion. Is, then, glass painting to be free of all control—the only art let loose in the vanity of unmitigated fancy? A complaint commonly made by glass painters is that, if their art be tied by old restrictions, they have no opportunity of raising it. They demand freedom for "high art." But, on a closer questioning, it is found that few of such complainants have studied general art principles at all extensively; and that, in the detail, knowledge and drawing of the figure, upon the perfect acquaintance with which "high art" entirely depends, both their education and practice are still more at fault. The complaint, therefore, resolves itself into little else than impatience of the conditions of the art they profess. If only they would recognise the dignity of their own beautiful art, and work within the sphere of "glass" without wandering into that of canvas, and exert their powers in perfect truth of form and in that use of colour which distinguishes a window painter's glass from a picture painter's palette, we should then happily arrive at an art as "high" as the artist can produce, and one made perfect by being perfectly consistent with itself.

Poppy-Heads.

In the contract for Beauchamp Chapel, Warwick (Ap. Gloss.) A.D. 1450, we find mention of "a pair of desks of timber, *poppies*, seats, sils, &c." It is not improbable that the term in this instance is meant to include the entire seat-end; but it is more reasonable to attribute this to a loose use of the term proper to the surmounting ornament than to any idea so far-fetched and so uncountenanced by Mediæval usage as that of the resemblance to the poop of a ship. Again, in Hearne's Glastonbury, "for the makyng off the dextis (*i.e.* of the desks) in the liberary (of Christ Church, Oxford) . . . after the maner and forme as they be in Magdalen College (*i.e.* we presume in the chapel), except the *popie-heedes* off (of) the seites." This notice is interesting, as it seems to imply that the "popie-heede" was looked upon as an ornament proper to a church seat only, and not to be used in the more secular "liberary." The form of the word does not, in this its current Mediæval form, differ materially from its modern one: "poppie," "popie," and "poppy" are all one. Neither does it seem to approximate more to the French *poupée* or Latin *pupa*, But when we find that *poppæa* was one of the forms which "pupa" had assumed in the Latin of the Middle Ages, we cannot doubt that this, and no other, is the true original of "poppie." Yet we must not hastily draw the conclusion that it was from its resemblance to a "puppet" or doll that the name was given to it. For, in fact, the poppy-head is very seldom, though it is sometimes, in the form of a human figure; an instance occurs in St. Andrew, Chesterton, Cambridgeshire. And if "poppy" meant merely a small statue, there is no conceivable reason why all figures in niches, &c., as well as on the ends of seats, should not have been so called; but of this there is no trace whatever. It is to a secondary sense of this class of words, then, and that a very curious one, that we must have recourse in order to understand how the ornament we are considering came to derive its name from this source. *Pupa* (and its Mediæval form, *poppæa*) is explained in the ordinary dictionaries as "statuncula *vestibus amicta*" (v. Facciol., Du Cange); in fact, it was rather "clouts," rudely formed into some resemblance to a human figure, than an image so carved. Hence the term came to be used for any small bundle similarly tied up. *Poupée* is explained in Roquefort's Mediæval Dictionary as "botte"—a word still in use in French, to express "a rag tied round a cut finger"; and accordingly Roquefort further defines *poupée* as "faisceau de lin, ou de chanvre." It was especially used of a bundle or handful of the last-mentioned substance (Fr. *chanvre*; Mediæval, *canbe*; Lat. *cannabis*; Engl. *hemp*). This is frequently mentioned as a feudal payment: "quatuor *paupadæ* (or *manadæ*, handfuls; or *cerri*, curls) de canbe." It is clear, then, that this class of words (pupa, poppæa, paupada, poupée, poppie, popie) would be very likely to be applied to anything which presented the appearance of being tied together in the middle, and thence curling over above and perhaps below also. Now this is on the whole a fair description of poppy-heads of all sorts, and an exact description of some. And the supposition we thus arrive at is simply this, that a small "puppet-like" bundle of this kind being familiarly called "a poppie" in the Middle Ages, the workmen gave this name to the bunch surmounting the ends of seats in churches. And, on this supposition, it clearly appears not only why figures in niches, &c., were never called "poppies," but also (which is at first sight more unaccountable) why the name was never extended to the bunches of foliage surmounting crocketed canopies, &c. For these, as being merely produced, as it were, of necessity by the conjunction of the two or more topmost crockets, have not that distinct independent existence which is the characteristic of the "poppy," and which suggested the name, by its resemblance to an isolated bundle or handful of anything.

Sacristies.

The details in the sacristy may be of a less ecclesiastical character than those admitted into the church itself. It may be questioned whether this license is to be extended to more dignified churches. There cannot be an objection to a fireplace and a chimney in a sacristy; let them be boldly and undisguisedly treated. Still a too secular style has been sometimes admitted. Aumbryes and a piscina are wanted in a sacristy. It would seem that there is little authority for an external door to a sacristy. An example remains, and that an eastern one, at St. Mary, Bitton, Gloucestershire; a late and anomalous example, the sacristy standing, moreover, in the middle of the north side of the chancel. There is much convenience in having a separate door now. It ought not, however, to open on the east side. External doors were not commonanciently, perhaps for the greater security of the sacred vessels and ornaments which were kept in the sacristy, perhaps because they would go far to make a priest's door useless. The latter need not be dispensed with if a separate door to the sacristy be allowed. Respecting large or town churches the rules are not so stringent. In these the sacristies may be in any convenient situation, of course nearer the altar than otherwise. Thus, at St. Mary Redcliffe they are on the north side, and have an upper storey of rooms fitted for residence; in the abbey church of St. Mary, Tewkesbury, they are beautifully-vaulted apartments to the south. In such churches the sacristy ought to glow with colour and ornaments no less than the more sacred parts of the building. The sacristies at S. Miniato, Florence, and Sta Maria Gloriosa de' Frari, Venice—the first south of the south chancel aisle, the latter south of the south transept—are remarkable examples. St. Anastasia, Verona, has a noble sacristy, north of the north transept. The Duomo at Milan has sacristies north and south, an arrangement adopted, not unhappily, in St. Paul's, London. At Cologne they lie to the north, and the detached sacristies at St. Peter's, Rome, lie also to the north of the north transept. On the whole the north, for dignified churches also, is the better side. The vestries of the churches in London built after the great fire, which provoke many a sneer from superficial observers for their supposed comfort, are rather to be regarded as instances wherein the architects have mastered the true idea of what they were building, placing it where most convenient, fitting it for its various uses and making it a not unworthy appendage to their costly churches.

NOTES AND COMMENTS.

It is remarkable how often the Irish people when they get a chance will repudiate the right of a man to do what he likes with his own property. As becomes Celts, they have a lurking belief that property is not an institution for individuals. A case that will amaze English surveyors and others was decided a few days ago in Dublin, which exemplifies the national but narrow way of looking at things. The Dublin Corporation were authorised to construct a market, and the owners of three houses that were required in order to obtain a site declined to come to terms with the Corporation, and it was necessary to go through the usual routine for such cases, and have the value determined by arbitration. The sum awarded was 516*l.* The owner was dissatisfied, and his case was brought before a judge and jury. At the trial it was stated that the value of the houses was enhanced by an expenditure of 187*l.* upon them when it was known that they were likely to be required by the Corporation. The opposition of the owner to the purchase would, however, appear to show that he contemplated the possibility of retaining his property, which would become valuable from its proximity to the market. The judge left it to the jury to determine whether the expenditure was inspired by a desire to make a larger claim. The jury, as became Irish ratepayers, decided in the affirmative, and the award was consequently reduced to 316*l.* The unlucky owner brought his case to a higher Court, when, fortunately for him, it was held that the judge was wrong in leaving to the jury the question whether the 187*l.* expended in repairs was or was not a *bonâ-fide* expenditure, that an owner dealing with his own property had a right to expend any money he liked up to the time of the appointment of the arbitrator. Their lordships directed that the sum of 187*l.* should be added to the 316*l.*, the amount of the award found by the jury. It will be seen that the owner receives only 503*l.* It is needless to say the decision of the Irish Queen's Bench Division corresponds with English views, for every day people are endeavouring to make the most of their property and there is no law to prohibit their foresight.

The last meeting of the Manchester Architectural Association was held on the 17th inst., as it has been amalgamated with the Manchester Society of Architects, that sadly needed some young and earnest members. It is announced that the library, bookcase, minute and letter books of the Association are made over to the Society, but it is to be hoped that with the new members something more will be transferred, otherwise there is not much hope for architecture in Manchester. As the Society had lost its importance, it is no wonder some members of the Association were dissatisfied with the arrangements. But the Association committee were eager to have only one Society, and they succeeded in "making arrangements that the work of the Association should be as efficiently carried out by the new Society as by the Association, and that every member of the Association should have the opportunity of joining the new Society." It is to be earnestly desired that under the new conditions the Society of Architects will gain respect in Manchester. The treatment by the Corporation of the petition from the members about the church-tower on a late occasion reveals the state of local opinion upon the Society, and it was therefore time to bring about a change. That has been done, and with wise management the reformed Society will no doubt be able to render some service to the profession.

The direction of civil buildings and national palaces is attached in France to the Ministry of Public Instruction and Fine Arts, along with the historic monuments, theatres, archives and museums. It is now intended to transfer the civil buildings and palaces to the Minister of Public Works. There will be a reorganisation of the service. At present, in addition to the bureaux of direction, there is a council that is constituted by eight architects, four of them being inspectors-general, who are permanent members, and the remainder being *architectes en chef* who have charge of buildings. Henceforth the inspectors-general, who will be selected from the *architectes en chef*, will receive 6,000 frs. a year, but each of them is to retire when he reaches his seventieth year. Each will have charge of a division of the service, and united they will form a consulting committee. By special permission, an inspector-general may complete any work entrusted to him before his election, but he is to receive no more new commissions for national works unless he wins them in public competitions. The *architectes en chef* will be selected by the minister from the class below—that is, the inspectors—and their fees will be 4 per cent. on works of conservation and 3 per cent. on new works. Seventy years will place them also on the retired list. The inspectors are to be drawn from Prix de Rome men, or from sub-inspectors, and the latter class can be recruited by competition. The "contrôleurs" and "vérificateurs" will also be selected by competition. It will be seen that by the scheme it is sought to combine two principles; one is the right of winners of the Prix de Rome to office, the second is public competition. It remains to be seen whether both will have equal weight in the selection of officials.

It has been found necessary to close the library of the Edinburgh Architectural Association. This step could not be avoided, for it appears the books are disappearing. The committee cannot persuade themselves that there are thieves among the members, and therefore it is assumed that the books are retained through carelessness or forgetfulness. As the volumes are inscribed on several pages with the title of the Association their commercial value cannot be much, and when removed it could hardly be with the expectation of selling them. But some men are strong in acquisitiveness and exercise it without hope of gain, and it is not amazing to learn that a short time ago two volumes bearing the stamp of the Association were found in an auction-room among the books of a deceased member and were only withdrawn from sale and restored on being claimed by the secretary of the Association. Probably the deceased member was the son of an Edinburgh hotel or shop-keeper, in which case his propensity can be easily understood. About twenty-five volumes have disappeared, and as some of them can at any time be bought for a shilling or two the removal of them would be inexplicable unless we believe the old northern principle survives, "that they should take who have the power and they should keep who can."

Hitherto the State manufactory of porcelain at Sèvres has been controlled by an artist, or a chemist, or a potter. Generally the chemists were selected, for there is continually expectation of gaining some improvement in colours or in the preparation of the materials by the aid of science. As for art, there is always a superabundance of men who are able to represent it, although the authorities may not believe in their capacity for direction. The scheme, which may now be said to be settled, revolutionises the old arrangements. There will be no official presiding over the establishment as a whole. The directors of design, chemistry and administration will be independent, and it is anticipated there will be no difficulty about their co-operation. M. Vogt will be the chemist and chief potter, and from his experience there is no doubt his appointment will be approved in the manufactory. It is likely that M. Joseph Chéret, who served as substitute during the illness of the late Carrier-Belleuse, will be the director for art. M. Baumgard is to be entrusted with the administration of the establishment.

It appears that in one of the principal London club-houses the cockroach nuisance has enormously increased in the kitchens and other hot places in the building since the wires for the electric light were carried across the kitchens. The cockroaches eat their way into the wooden casing, and live at ease in the grooves along which the wires are laid. The ordinary warfare which is carried on in all great kitchens against cockroaches and other insect plagues has no effect when the enemies are protected by casings. They increase and multiply in security, sally out at night in their thousands, and colonise other parts of the kitchen. It has been found that the only remedy is to take down the wooden casing where it is carried over stoves or hot-plates, or in any position where the heat is great, and replace it with lead or compo tubes to carry the wires. The ends of the tube should, of course, be well stopped with some tar compound. The tube ought also to be carried on strong brackets several inches clear of the wall and ceiling, so as not to afford any cover for insects.

ALTAR AND REREDOS IN ENGLISH CHURCH, FLORENCE.

THE works shown in the illustration are recent additions to the English Church dedicated to St. Mark, in the Via Maggio, Florence. The altar is of marble and is surmounted by a reredos of carved and gilded woodwork, with three paintings in the style of the old Florentine altar-pieces of the Cinquecento. The paintings are in egg tempera, with a great deal of gilded ornament in relief. The form of the altar-piece was determined by the existence of a stained-glass window which could not be blocked up. The available space was consequently very limited. Signor Venzi, of Florence, executed the wood-carving and gilding, and the whole work was carried out from the designs of Mr. George Jeffery and under his direction.

NO. 440.—HOUSE OF LA REINE BERTHE, CHARTRES. [H. WILSON.]

FREE PUBLIC LIBRARY, BRECHIN.

THE illustration is a reproduction from the design submitted under the motto "Fleur de Lys" in the late competition by Mr. McLellan Fairley, of Edinburgh, and which was adopted and is about to be carried out. The principal front faces Southesk Street, and a side entrance from St. Ninian's Square gives access to the house. The rooms are arranged on the axial system, consequently no space is lost in passages or corridors, and the whole can be supervised by the attendant at the borrowers' counter. The hall, which is approached by the principal entrance, is 18 feet by 9 feet; the news-room and reading-room is 40 feet by 22 feet; the reference and magazine-room is 22 feet by 18 feet; the lending library is 25 feet by 18 feet, and the librarian's and committee-room 18 feet by 14 feet 6 inches.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the opening meeting of the current session of the Edinburgh Association Mr. James Bruce gave notice of motion for next meeting as follows:—"That this Association, as taking a deep interest in the careful preservation of the ancient buildings of Scotland, particularly of those in or near Edinburgh, has observed with great satisfaction that the Marquis of Lothian has recently been personally present at an examination of the present condition of the Royal Palace of Linlithgow, which has been in a roofless state since the fire of 1746; that the Association feels that the buildings of the Palace are at present in a critical state, and expresses a hope that, without delay, such steps will be taken by Government as will prevent the further internal decay of the Palace through exposure to the weather, and remove the imminent risk of part of the masonry falling and thereby causing serious destruction to the remainder of the fabric." In his inaugural address, Mr. John Kinross, the president, stated that at present there was a membership in the Association of about three hundred, and a balance at credit of ordinary account of 75*l*. He explained in detail the steps taken by a committee appointed in the beginning of the year towards furthering a scheme of education in applied art by the establishment of a school of design. The committee, it appeared, issued a circular on the subject and invited subscriptions with the view of raising 2,000*l*., so as to defray the cost of classes for a period of five years from the outset, the subjects of study proposed including architecture, decoration, sculpture, wood-carving, metal-work, &c. A very gratifying response had been made to the appeal, donations and subscriptions representing 1,385*l*. having been received by the end of April last. Assurances had also been received that the scheme was favourably entertained by the Board of Manufactures, and that it had the hearty approval of the Secretary for Scotland, while the necessary accommodation had been set apart for the Association and the classes in the rooms formerly occupied by the Museum of Antiquities in the Royal Institution. The Association might, therefore, congratulate itself on seeing a new career of usefulness opening up, and also on having a home worthy of the objects to which its members were devoted. Professor Baldwin Brown, in moving a vote of thanks to the President for his address, proposed that the Association had heard with great pleasure of the progress made in regard to the proposed School of Design, and viewed with the heartiest approval the proceedings already taken. He remarked that he should like to see, as part of the system of the proposed School of Design, arrangements made for a certain amount of practical work, sufficient to bring the student into touch with the genius of the materials. Mr. H. F. Kerr seconded the motion, which was adopted.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE third lecture of the session was given by Mr. Archibald Macpherson, vice-president of the Edinburgh Architectural Association, his subject being "The Scottish Mansions." The president, Mr. William J. Anderson, occupied the chair. The paper was an historical sketch of the development of the dwelling-house from the keep or fortress. The period from which this movement dates, as observable in the specimens extant, cannot be put much earlier than the beginning of the fifteenth century. Timber structures were more common than is sometimes supposed, but these we know of only by meagre description. A number of illustrations of typical examples were shown, if noticeable for the vigour of architectural treatment not less for the primitive arrangements that must have made comfort next to impossible. What the exact social conditions of these early times were it is not quite easy to determine, as historians differ—some painting a picture of people rude and barbarous in the extreme. Various authorities were quoted by Mr. Macpherson, whose opinion serves to modify this view, but hardly explains satisfactorily how a nation, not over wealthy, not far behind other European countries in its appreciation of art and learning, should yet have remained so long content with its poor and inconvenient dwellings.

ST. PETER'S ABBEY, GLOUCESTER.

A LECTURE was given in the chapter-house to the Gloucester Cathedral Society by Mr. W. H. St. John Hope, F.S.A., secretary of the Society of Antiquaries, entitled "Notes on the Buildings of St. Peter's Abbey, Gloucester."

The Very Rev. the Dean, who presided, in introducing the lecturer (according to the *Gloucester Chronicle*) said most of them had been brought up with the idea that the great minsters of old were nothing but hives of drones; but, after considering the question, they had come to see that the monks occupied a special and peculiar position, and that in these minsters everything that was noble and pure in literature, art and religion was concentrated; that, figuratively speaking, during long ages of war and rapine they floated on the storm-waves safe and inviolate among all the elements of destruction around them. He had come to know, as many of them had, that in those great houses of prayer and praise and thought and study everything that thinking, praying men deemed valuable and precious was preserved. He hardly dared to think what the world would have been during the eleventh, twelfth, thirteenth, fourteenth and fifteenth centuries without those great homes. They must look upon them as occupying the position of schools, hospitals and refuges for the poor and sick and sinful on the one hand, and as homes of learning on the other. It was of great importance to the thinker, the earnest religious man, the artist and the architect to know something of the buildings composing these great houses and of their use. He had therefore thought that one lecture at least of the course to be given for the society should be on the buildings of their great abbey of St. Peter, which Mr. Freeman had pronounced almost unique. They had asked one of the foremost men, Mr. St. John Hope, to tell them what a great Benedictine house they had.

Mr. St. John Hope first explained the drawings he exhibited, which showed the ground plan of the cathedral and the old buildings surrounding it which formerly existed, whose foundations had been traced, and also similar drawings of the great Benedictine houses of Canterbury, Durham and Westminster. Following Professor Willis's plan, he had first gone into details given in old documents, and then he had examined the remains of the buildings themselves. Rites, an ancient scribe of Durham, had left on record a large number of details appertaining to the buildings attached to Durham Cathedral, and the uses made of them, and these particulars were valuable, because they equally applied to similar buildings elsewhere. The lecturer, in reading his elaborate paper, traced the successive changes made in Gloucester Cathedral from its foundation in 681, and the numerous buildings surrounding it. He pointed out on the drawings the position of these, and entered into a variety of details concerning them. He described the chapter-house and cloisters in some detail, especially referring to the north cloister, which was appropriated to novices, and the beautiful lavatory it contained, which was so well preserved, and to the marks which were still visible on the walls of games which had been indulged in. The stonework outside this was,

in his opinion, connected with the waterworks; but this and much connected with the water supply to the various other buildings must remain at present undecided, as a good deal had yet to be made out. There seemed to have been two supplies, one for drinking and washing distributed by pipes to where it was wanted, and the other for turning a mill. Among the rooms he described was "the king's chamber," so called from its sumptuousness, and the bakehouse, brewhouse, casual wards for pilgrims, &c. Many of these buildings were of early thirteenth-century date, and though much of them was destroyed that which remained showed good work. Lengthy as were the details given by the lecturer, he remarked in conclusion that there were several others he ought to have gone into, but he felt that his "Notes" had already grown to a most dreadful length, and so he would say so more about them.

The Dean said he was sure they hardly knew how to express their gratitude to Mr. St. John Hope for his able and exhaustive paper, which suggested two or three things to him. First, as to the life of the monks, he noticed that he only used the word "comfort" once. He (the Dean) wanted the audience to see what a stern life theirs was. After they had been fifty years leading those hard lives, then they had quarters which afforded them some comfort. Amongst the "blessings" which England received from the abolition of these monasteries (he did not by any means wish it to be inferred that they ought to have been retained, because after the invention of the printing-press their great work was done) was that which had developed into the Union Poor-house and our Poor Law administration, which he believed was one of the greatest curses with which the country was afflicted. Another thing which struck him was the wanton destruction of our forefathers. The Abbots' Camera, built in the fourteenth century, was literally swept away—what a blessing it was that they didn't touch the Deanery. And yet there were persons alive who could have told them much about the remains if they had been left. This must not interfere with the vote of thanks he proposed to Mr. St. John Hope.

ANTIQUARIAN DISCOVERIES NEAR ALEXANDRIA.

THE Cairo correspondent of the *Times* writes as follows :—In the *Times* of October 12 appeared a brief telegraphic announcement of the late interesting antiquarian discoveries at Abukir, distant 13½ miles by rail eastward from Alexandria. Excavations are being continued under the direction of Daninos Pasha, a *savant* well qualified for the work, to whom is due the merit of the discoveries; and, if Government will supply the funds necessary to enable him to continue his researches, there are abundant indications that valuable "finds" will be made in a locality hitherto almost neglected by archæologists, and presenting much that is interesting, especially to students of the Græco-Roman period.

At four to six feet below the surface the diggers found three statues in rose granite, ten feet high, lying faces downwards, amongst the ruins of a temple, of which part of the outer wall with lower portions of columns and several square yards of flooring have been laid bare. The statues had been originally erected at or within the temple, and one of them is lying in front of its pedestal, which is about three feet high. They represent in a group, according to the hieroglyphic inscription, Rameses II. (the Greek Sesostris) and his Queen Hentmara seated. The third statue is of Rameses II. in an upright posture, wearing a pleated tunic, bracelets, military crown, and a girdle bearing the inscription, "Beloved of Seth." At his left side he holds a sceptre, surmounted by the head of his son Menephtah (the Pharaoh of the Exodus), whose cartouch is inscribed on the sceptre. On the plinth at his back, which is of equal height with the statue, is chiselled a bas-relief of Queen Hentmara in profile, wearing a pleated tunic and the Royal tress. The inscription above her head is "Daughter of the King—beloved of her father—Royal spouse—great favourite Hentmara." On the back of the plinth is carved the Royal banner of Rameses II., with all his known titles and appellations. The execution of the three statues is in the plain, vigorous style of the 12th Dynasty. The feet of Rameses, which had been broken off in one piece with a clean fracture, were found at a few yards distance. The two heads of the group have also been broken off, and are being searched for.

It is surmised that the temple and statues were overthrown after the edict of Theodosius, A.D. 380, abolishing the Egyptian religion, but nothing has yet been discovered to identify the temple with any of those known to have existed during the Egyptian or Græco-Roman periods. Dr. Neroutsos Bey's interpretation of the inscription is—Hentmara, daughter of the King, beloved of her father (*i.e.* the preceding king, Osiris Menephtah, who was father of both Rameses and Hentmara), Royal spouse (of Rameses II.), the (referring also to Rameses) great favourite of Seth.

The Pharaohs, following the example of Osiris, King of the Gods, and his sister Isis, had the prerogative of espousing their own sisters, and this custom, consecrated by both the civil and religious law, was followed in several instances by the Ptolemies.

Dr. Neroutsos, who is a well-known Egyptologist, has lately published a work, entitled "L'Ancienne Alexandrie," embodying his researches, made during a long residence, and he is perhaps the greatest living authority upon the topography of the ancient city and neighbourhood of Alexandria. Referring to the locality in which the above-mentioned antiquities were found, and which abounds with remains of old buildings, he recommends that explorers should seek to identify—

1. The small Egyptian town Menouth, with its temple to Isis, and subterranean burial-places. Such a place has just been discovered by Daninos Pasha, in the solid rock, entered by a vertical shaft 40 feet deep, and a sloping staircase of 45 steps, terminating at the bottom of the shaft, where a series of galleries commence, extending in length to 170 feet.

2. The Græco-Roman village Zephyrion, where stood a temple to Artemis Sotera and numerous country villas.

3. The headland Zephyrion, on the highest point of which was a temple to Venus Arsinoe, Protectress of Mariners.

4. The Byzantine monastery of St. Cyr, corrupted to Abba Kyr, whence the name of the present town of Abukir.

The monastery and neighbouring buildings were destroyed by an earthquake, followed by a tidal wave, soon after the capture of Alexandria by the Arabs. More than a dozen sphinxes and ruins of massive buildings, submerged by that catastrophe and subsequently, are now plainly visible in the shallow waters of the bay.

CITY CHURCHES.

A COMMISSION will be issued shortly, says the *City Press*, to consider and report upon the expediency of a union of St. Dunstan-in-the-East and Allhallows, Barking; but we doubt if the Commissioners will be bold enough to recommend the removal of either of these churches. The former is a magnificent pile, unequalled in its own particular style. The latter was founded by St. Erkenwald, Bishop of London, in 675, and is of the greatest interest from an architectural as well as antiquarian point of view. It is one of the few churches connected with the City which dates back in its structure to very ancient times. In it the pointed arch and clustered pillars of early Gothic have hardly yet superseded the massive column and round arches of the Norman period. The church is tolerably equally divided between the two. To recommend destruction here would be nothing short of vandalism. St George, Botolph Lane, is marked for removal—the sooner the better, for it is neither useful nor ornamental. St. Olave, Old Jewry, and St. Mary Magdalen, Knightrider Street, will soon be known by name only. St. Mildred, Bread Street, and Allhallows the Great, Thames Street, with St. Michael, Wood Street, are amongst those "marked for removal," although no positive steps have yet been taken in the matter. With regard to St. Mildred, the parishioners pronounced so strongly against a report which suggested the removal of their church, that the matter is in abeyance for a time. The following churches are now closed :—Allhallows, Upper Thames Street; St. George, Botolph Lane; St. Margaret, Lothbury (for repairs); St. Martin, Ludgate Hill; St. Mary-at-Hill, and St. Mary Magdalen, Old Fish Street. St. Mary-at-Hill is from a sanitary point of view very bad; and some think that St. Mary Woolnoth, though only reopened on All Saints Day last, will require to be again closed.

GLASGOW ARCHÆOLOGICAL SOCIETY.

THE thirty-fifth annual meeting of the Glasgow Archæological Society was held last week. Mr. John Honeyman president of the society, occupied the chair.

The annual report narrated the work done during the past session, and stated that the number of members was now 319. The Council proposed to continue the Saturday afternoon excursions with a varied programme. Mr. Honeyman, who had for more than three years filled the office of president, now resigned office, and the Council recommended the election of Prof. Ferguson, LL.D., as president for the next term of three years; and the re-election of Mr. Donald and Dr. Murray and the election of the Most Rev. Archbishop Eyre, D.D., as vice-presidents. The Council also recommended the re-election of Dr. Mackinlay, Prof. Veitch, Dr. Macdonald and Prof. Lindsay, and the election of Mr. Honeyman and Mr. George Neilson, to fill the vacancies in the Council; the re-election of Mr. J. Dalrymple Duncan and Mr. W. G. Black as hon. secretaries, and of Mr. Marwick as hon. treasurer.

This report having been adopted,

Mr. Honeyman delivered his retiring address as president,

in the course of which he said that the progress which the society had made of late years had been very remarkable. He believed that the increase in its membership had been unprecedented.

Professor Ferguson then took the chair and delivered his introductory address as president. After dealing with the scope and methods of archæological research, he said that in Glasgow they were rather lacking in facilities for the comparison of antiquities. Museum facilities there were almost none. He did not say that they wanted a museum of local antiquities in Glasgow, but he felt quite safe in saying that such a museum would be extremely popular. Glasgow could never expect to make collections like those in London and Paris. The waves of history had not washed round it as they had round these great centres of life and civilisation. But Glasgow was surely old enough and as yet unmodernised enough to yield something illustrative of its past history. He was not sure that a multiplication and competition of museums was desirable. While it was of first importance that an object should find a safe resting place somewhere, it was also of importance that it should be placed alongside objects of similar character for mutual illustration. It was only by minute comparison of seemingly trivial points that one got ultimately at the truth and meaning of things to begin with, and then from that to more comprehensive views. A local museum could serve for the annals, topography, and the antiquities of a town or district more efficiently than a central museum, unless it were of the very largest dimensions. In Glasgow there were certain local antiquities, those relating to the rise and development of the place itself, maps, pictures, histories, plans, models, and a dozen different things which were of special interest to Glasgow inhabitants, but of comparatively little interest to the inhabitants of other places. To Glasgow itself one would come naturally to study its past history and antiquities rather than, say, to the British Museum or the Bodleian Library. But where would we find what we wanted? Mostly in private hands. There was no public place in the city, the property of the city, cared for and fostered by the city, where its growth and past history could be seen and followed. This seemed a suitable time for something being done, when the city had now assumed such important dimensions, when it was likely to be provided with accommodation for artistic and museum purposes commensurate with its size. But the historical side of the growth of the place was very apt to be forgotten, and that was to many persons quite as attractive as its natural history. It was to be hoped that in the new buildings a suitable portion would be allocated for a Glasgow collection. There was abundance of material—much of it very likely was lost just for want of a suitable place for keeping. Doubtless many presents would flow into it, just as into the Glasgow department of the Mitchell Library books had gone to be preserved which otherwise might have been destroyed or lost or wandered away from the place where they were first produced. There was no lack of local enthusiasm for Glasgow and its history and antiquities, and it could be very safely left in the hands of those who of recent years had written its history, edited some of its characteristic works, preserved by photographs and otherwise the remains of old houses of historic and family interest, and who had told the story of its streets and squares and public buildings. But we wanted, after all, a place where Glasgow relics could be preserved.

A vote of thanks was passed to Professor Ferguson for his address.

TECHNICAL EDUCATION.

A CIRCULAR has been issued by the Science and Art Department of the Committee of Council on Education containing some new regulations with reference to the grants for successes at science examinations held annually in April and May. The means recently placed at the disposal of local authorities under the Local Taxation (Customs and Excise) Act and the Technical Instruction Act for providing or aiding instruction, seem to render it unnecessary for the Science and Art Department to continue to give direct aid for very elementary instruction in science, which can now be more effectually organised and maintained locally. It is suggested, therefore, that the payments for imparting this instruction should, to some extent at least, not be made on the results of individual examinations, and that local authorities, with their knowledge of local needs and requirements, are in a position to make capitation grants or payments for general efficiency in a manner which a central authority, whose rules must be the same for all parts of the country, cannot adopt. It has therefore been decided that after the next May examinations the payment of 1*l.* now made for the second class in the elementary stage of each science subject shall cease. An elementary paper will continue to be set in each subject, but the results will be recorded simply as "pass" or "fail," the standard for passing being about the same as that now required for a first class—*i.e.* about 60 per cent. of the marks obtainable. With the view, however, to encourage more advanced instruction, which in the opinion of the Department does not seem to be adequately provided for at present, the payments for the advanced stage and for honours will be considerably increased. The payments on results will then be 2*l.* for a pass in the elementary stage, 5*l.* and 2*l.* 10*s.* for a first or second class respectively in the advanced stage, and 8*l.* or 4*l.* for a first or second class respectively in honours in each subject of science, and in each sub-division of theoretical mechanics, or of sound, light and heat. The exceptions are practical chemistry and mathematics, in which the grants run about 1*l.* higher in each stage. To discourage the presentation of large numbers of wholly unqualified candidates, a deduction will be made from the grant to each school on account of papers worked which do not obtain 25 per cent. of the marks. There is a proviso that if they so desire it the committee of a science school in a place in Great Britain with less than five thousand inhabitants which does not receive aid from the local authority, or of any science school in Ireland, will be allowed to continue until further notice on the present system. The effect of these regulations, it is expected, will be to largely revolutionise the arrangements under which science classes and schools are conducted, to generally raise the standards of tuition, and to force the hands of those local authorities which have not adopted the Technical Instruction Act.

ART EXHIBITION IN MELBOURNE.

IN February next an exhibition of works by contemporary British artists will be opened in Melbourne, under the direction of the Royal Anglo-Australian Society of Artists. It will include about three hundred oil and water-colour paintings, many of them by artists of eminence. Sir Frederick Leighton has lent his three black-and-white studies in drapery—*Demeter*, *Persephone* and *Solitude*—and among the other pictures will be Mr. Marcus Stone's *The First Love-Letter*, Mr. M'Whirter's *Edinburgh*, Mr. Frith's *Poverty and Wealth*, Mr. Jacomb Hood's *Daughter of Jairus*, Mr. Collier's *Lilith* and *Incantation*, and Mr. Schmalz's *Faithful unto Death*. Among other artists represented will be Mr. Alma-Tadema, Mr. E. Waterlow, Mr. J. W. Waterhouse, Mr. Solomons, Mr. Frank Dillon and Mr. Fahey. There will also be a German room, containing about sixty pictures by representative German artists.

ARCHITECTS' CERTIFICATES.

ON Monday the case Elmes *v.* Burgh Market Company came again before Mr. Justice Vaughan Williams. It had been heard at Nottingham, when his lordship described it as follows in the course of his judgment:—This is an action brought by a contractor for the balance of money alleged to be due to him for works executed by him for the defendants. The first defence raised is that, under the contract, a certificate from the surveyor appointed under the contract is a condition precedent to the plaintiff's right of action, and that no such certificate has been obtained. The plaintiff relies upon a certificate dated November 22, 1890, which is in the following terms:—"Works at Burgh Market, Spilsby, November 22, 1890.—J. W. Thimbleby, Esq. I, the undersigned, do certify that Thomas Elmes is entitled to receive the sum of 127*l.* in payment of final instalment of contract after maintenance of the above-named works. 127*l.*—(Signed) J. B. Butcher, architect." Two objections are taken by the defendants to this certificate—first, it is said that it is not such a certificate as is required by the contract that the whole of the works were in a complete and satisfactory state; and, secondly, it is said that the person who gave the certificate was not at the time of giving it surveyor within the meaning of the contract. I am inclined to think that the first objection is on the authority of Morgan *v.* Birnie (6 Bingham, 672) a good objection; for the document of November 22 seems to me to be a mere statement of account, and not the required certificate. I further think it doubtful whether the person giving the certificate continued to be the surveyor for the purpose of certifying after his discharge, which occurred before November 22, although there are some grounds for saying that "surveyor" means the person who in fact was the surveyor when the work was executed. But neither of these points is of much importance, because the plaintiff also relies on the oral certificate of Mr. Butcher given to the chairman of the defendant company and to the directors; and I find that this certificate was, in fact, given; and, in my opinion, it was the giving of this oral certificate which really led to the dismissal of Mr. Butcher from his post of surveyor. I also hold that the certificate required by the third clause of the contract is not a certificate in writing; and I find that the plaintiff did in fact complete the whole of the works to the satisfaction of the surveyor, and that such works were in a complete and satisfactory

state to his satisfaction at the end of the period of maintenance. Under these circumstances, I give judgment for the plaintiff for the amount claimed, with costs."

It appears that clause 2 of the contract provided :—"The works shall be completed in all respects and cleared of all implements and tackle, &c., within three months from date hereof to the satisfaction of the (said) surveyor, to be testified by a certificate under his hand." And clause 3 provided :—"The contractor shall receive payment for his contract at the rate of 80*l.* per centum for the works completed on the surveyor's certificate of completion, and the balance at the end of the term of maintenance, less deductions that may be made in accordance with the terms of the contract, and on the surveyor certifying that the whole of the works are in a complete and satisfactory state." The "maintenance" clause, contained in the specification, stated that "the contractor shall maintain the whole of the works in a complete state of repair for a period of three calendar months from the full completion of the works, to be testified by a certificate from the surveyor." It was contended at the trial by the defendants' counsel that no proper certificate had been given by the surveyor to satisfy the terms of the contract.

After the delivery of the judgment at Nottingham the defendants' counsel applied that the consideration of the case might be further reserved in order to enable the defendants to call certain witnesses, whose evidence had not been taken at the trial, to contradict the statement of the surveyor that he had given a verbal certificate of the satisfactory condition of the works to the secretary of the defendant company. The case was accordingly further adjourned to London, and that evidence was given, but the judge confirmed his prior judgment, saying that he saw no reason to alter it.

THE DUNDEE INSTITUTE.

A CONVERSAZIONE under the auspices of the Institute of Architecture, Science and Art took place last week. Mr. Charles Ower, the president, in opening the proceedings, said he had to affirm to the members, associates and friends the continued prosperity of their Institute. It was still advancing, the membership was increasing, and he was glad that the work it was doing was being more appreciated as its aims were becoming better known. While they were anxious to stand well with the public, they were not neglecting the professional side of their work. The library was flourishing. The prizes were well competed. The course of lectures was both interesting and instructive, and it was hoped that the electrical ones, which came next in order, would be of real practical value to the community. Mr. Ower proceeded to refer to the meetings, lectures, excursions and social gatherings of the Institute, and said these would be worse than wasted if they produced in the members no love for the beautiful and true, no feeling that they would like to do, or at least be the means of others doing, good artistic work. Artistic study without the desire to produce or promote art works was dead, and he desired to inculcate the theorem that the fine arts were in all and for all. He wished to take the fine arts in the widest sense, and he defined them as the arts which ministered to the sentiment of taste through the medium of the beautiful in form, colour, rhythm, or harmony—the arts, in fact, of architecture, sculpture, painting, poetry, and music. The office of these arts was to harmonise and refine, to purify enjoyment, and when duly appreciated to connect the perception of physical beauty with moral excellence, and it would be his object to show that in order to satisfy the wants of their higher nature it was necessary to know and feel something of those fine arts, which were merely different forms of expression of a certain feeling for the beautiful, which they might call the art sense; and just as they spoke of the senses of touch, taste, sight, hearing and smell, he maintained that there was another sense, the sense of the fitness of things and ideas. This he called the art sense. It would be found that all the expressions of this art sense produced in them similar sensations, and that the language they used in attempting to communicate to others what they felt when they were moved by any of the forms of expression of the art sense applied all through. He held that the person who did not have pleasure in the use of the art sense had something wanting in his nature, something which had been withheld from him, something which he had lost from disuse or from long continuance in degrading pursuits, and the loss of which made him a little less than man and yet not brute. The art sense was useless to the brutes that perish, and to the class of persons in whom it was wanting. But a developed body with an uncultivated mind was worse than useless, for "'tis the mind that makes the body rich;" and as the sun showed through the darkest cloud, so did the cultivated mind at last emerge triumphant. Everything that fed the mind contributed directly to their material prosperity. Cultivation of the art sense, like godliness, was profitable for many things, both in this life and that which was to come. To sum up, no man could be said to be happy in the highest sense without mental culture. The study of the fine arts was now a necessity for mental culture, therefore no man could be happy in the best sense without knowing something of the fine arts and cultivating the art sense. They desired to be happy, therefore they studied the great means to that end. For that the Institute was made and for that they were there.

THE CHURCHES OF SHREWSBURY.*

IT has, I believe, been customary in the last few years that the member of this society who is appointed by his Fellows to preside at the annual meeting should address those present on the objects of the society generally or should read a paper of some matter of interest, whether in archæology or natural history. It is a good custom, but, as time passes on, and our field of inquiry becomes narrowed, the chairman of the day will find an increasing difficulty in presenting new matter of interest and in treading on untrodden ground. The matter I suggest to you to-day is one in which in right of my office I may be supposed to feel an interest. That office has to deal with the existing buildings and estates of the Church, and thus, in the small acquaintance I possess with the study of archæology, I naturally turn first to the ecclesiastical buildings and estates of ancient times. But this is a very wide field, so I limit myself to-day to some inquiry into the old foundations of churches in Shrewsbury, and particularly the parish churches which still survive. How did they arise? and in what order were they founded? In dealing with these questions, I am well aware that I shall have very little of direct or documentary evidence on which I may rely or lay in evidence before you. I must proceed almost wholly by circumstantial evidence or even mere conjecture. The conclusions I shall venture to express will be matter of inference rather than history, submitted not for your information but for your criticism. They will be open to all sorts of objection, and will provoke discussion. I expect this, and what is more, I desire it. If my conjectures succeed in provoking discussion, the discussion will provoke inquiry, and inquiry will lead us some way, even in the dark, towards the truth.

Which, then, is the church of oldest foundation in Shrewsbury? If the answer when given be not very profitable, yet the inquiry is very interesting to some of us. For I remember, on occasion of Bishop Selwyn's first visit as diocesan to Shrewsbury, he asked (with reference to some action he was about to take), Which is your mother church? He was thinking doubtless of other places far larger now than Shrewsbury, which have grown up since the Norman Conquest from mere villages into populous towns and cities, yet recognising the one mother church which at Domesday sufficed for their inhabitants. He forgot that Shrewsbury was of provincial importance in Anglo-Saxon days, and certainly had more churches than one before the system of parishes was completely organised. Bishop Selwyn had for the moment innocently supposed that St. Mary's was the mother church, and was much amused to find that of the clergy present (it was happily only a clerical meeting) three other claimants came eagerly to the front. Of course, being a practical man, he dropped the question with a smile. But we, in so far as we are archæologists, do not limit ourselves to what are called practical questions, and hold that many things are indirectly useful which are of no immediate utility. So I ask the question once more :—Which is the church, of those now existing, which is of oldest foundation in Shrewsbury? There are now ten churches with ecclesiastical parishes assigned to them. In pursuit of an answer to my inquiry, I will deal with them by a process of exhaustion :—

1. We may set aside All Saints Church at once. It was founded in 1871, and does not even represent, as some of the other suburban churches do, any earlier dedication of a church swept away in the sixteenth century. And I may add, by the way, that we rarely find in places where at Domesday several churches existed, any one of them was thus dedicated. The title of All Saints was used chiefly where only one altar was set up, and the honour and interest of the whole roll of the saints was sought.

2. We may next clear out of the way the church of Holy Trinity, founded in 1836. But in this case the dedication does revive that of several altars in the old churches and chapels of the town which were consecrated by this name.

3. St. George's next passes out of the reckoning, consecrated in 1832. Its title, however, revives that not of an altar merely, but of a non-parochial church or chapel with a hospital, or what we should now call almshouses, which stood once within St. George's parish, not far from the Welsh Bridge. This earlier foundation was only of Norman date.

* An address by the Ven. Archdeacon Lloyd, given at the annual meeting of the Shropshire Archæological Society.

4. For St. Giles Church, which I think stands next, there is more to be said. I can well remember when, half a century ago, it was reputed to be the most ancient church in Shrewsbury, and on one occasion, when several scholarly men were present, one of them settled the question by quoting Pennant as having said so. "Pennant's Tour" was a book of great authority in those days, and indeed is still a sound book when Pennant describes things as he saw them; but not when, like myself to-day, he goes on to draw conclusions. But, to do him justice, he does not say this of St. Giles Church. All he says is that when he came to Shrewsbury he was told so. However, we may conclude now that the claim for St. Giles of earliest foundation was an empty one. Not only is St. Giles not mentioned in Domesday (which would not be conclusive, for the roll of then existing churches is not quite complete in Domesday), but, more than that, I believe that St. Egidius or St. Giles, as a patron saint of English churches, only came over with the Conqueror, and that there is no instance of consecration by his name before quite the close of the eleventh century.

5. Next comes St. Michael's Church. I place this as having a better claim to antiquity even than St. Giles, because, though the present building was erected only in 1831, and I was myself present at its consecration, yet it is not only a revival by name of one of the old parish churches of Shrewsbury of at least Anglo-Saxon date, but the parochial area assigned to it corresponds in large measure with the parish attached to that earlier church. The church of St. Michael stood just within the gateway of the castle. Owen and Blakeway's "History of Shrewsbury" is of opinion that it must have been founded by Roger Montgomery when he rebuilt the castle. But when we consider that the garrison within the castle had also a chapel, still existing, in the main building, and that further provision was made in the chapel of St. Nicholas for the garrison outside, and more than this, when we remember the considerable size of the parish attached to this church outside the town, it seems at least probable that the church was of earlier foundation than the Norman castle, but came to be included within its walls when those walls embraced a larger area of fortification. The church of St. Michael seems to have gone much out of repair in the fourteenth century, and soon afterwards its parochial bounds were broken up by a large portion being assigned to St. Julian's Church, some part to Battlefield, some to St. Alkmond's, and some reverting to St. Mary, from whence Owen and Blakeway are of opinion the whole originally came.

6. We come now to the five old parochial churches, the only churches in use in Shrewsbury sixty years ago. Of these the most recent, in the date of its foundation, is that now known as Holy Cross, though originally dedicated to St. Peter. This church, when afterwards connected to the Abbey of SS. Peter and Paul, founded by Roger Montgomery, became the most dignified and wealthy, and excepting only the Cluniac monastery of Wenlock, the largest and most beautiful of all the ecclesiastical structures of Shropshire. But as a church and as a parish church the date of its foundation cannot be carried further back that the middle, perhaps, of the eleventh century. It lay altogether outside the town, and a distinct record of its foundation exists as having taken place by one Siward not long before the Conquest. It is also stated as being at that time the least noticeable and important of the churches in and about the town, while St. Mary's is named at the same time as the most considerable. The tradition that it was the most ancient probably arose from a mistranslation of a Latin account of the foundation of the abbey as having been laid "in a church which was *parochia civitatis*." This some wiseacre rendered the parish of the city, using the definite in place of the indefinite article, a parish of the town, *i.e.* one included within its liberties though extended to its walls. I may add that Owen and Blakeway, though they deal with the parish of Holy Cross first in their history, on account of the dignity of the abbey with which it became connected, are careful to state that it was the youngest of the five parishes of the town.

7. I hesitate not to turn next to the church of St. Alkmond. The date of its foundation must be between the death and canonisation of the Prince it commemorates, and its mention in Domesday. Very little is known about Alkmond, or why and when he became a saint. All that we know is that he was a Northumbrian Prince, and the last of his race, dying or being slain at the beginning of the ninth century. This church is said in the Leiger of Lilleshall Abbey to have been founded by Ethelfleda, Queen or Lady of the Mercians. This might have been the daughter of King Offa, who became wife of Kenwolf, King of Mercia, who died in 819. But this date seems to be too near to the death of Alkmond, and scarcely to allow time for him to become canonised. Or it might have been Ethelfleda, a daughter of King Alfred, who married Duke Elthelred and became ruler of Mercia after her husband's death. This was about 912, or the beginning of the tenth century. King Edgar afterwards, in the middle of this century, appointed to this church a dean and ten, or as Domesday says, twelve canons, and in the same book of Lilleshall is stated to have done so because he was descended from the same noble stock of Northumbrian kings as St. Alkmond. No less than eleven manors were attached to the college as recorded in Domesday. Two of these were soon lost, and the rest were alienated by Richard de Belmeis, in King Stephen's reign, in order to found Lilleshall Abbey. When complaint was made of the poverty in which the parochial cure was thus left on the suppression of the college, the wrong was rectified by the robbery from St. Mary's College of the tithes of Cotonhill, which remain to this day the main endowment of St. Alkmond's Vicarage. We cannot place, I think, the foundation of St. Alkmond's before 820, and more probably not till 920.

8. It is a little difficult to know where to turn next, but I turn to the church of St. Chad. It has for some years past been either asserted or taken for granted that St. Chad's was in some sense the "mother church of Shrewsbury." On two occasions during the last twenty-five years, when some improvements were being carried out in the church and subscriptions sought for their execution, the dignity of this church has been pleaded as being the "metropolitan church," and therefore having a special claim on its neighbours. In no true sense could the word "metropolitan" be applied. Shrewsbury ceased to be a metropolis since it was the capital of Powysland, that is, before St. Chad was born. And if by the term it was intended merely that St. Chad was the mother church of the town, I think it can be clearly shown that it cannot claim such antiquity. And first let me say that the claim is one only made in recent years, and has probably grown up from the fact that it had become fifty years ago the largest and the wealthiest parish; that nearly all the public offices of both town and county were within its limits; that the judges of assize ordinarily attended worship there before the opening of their commission; that the public occasions of worship by the Mayor and Corporation have since the Reform Act been observed there in nine cases out of ten, and that the incumbent of St. Chad's has therefore been the Mayor's chaplain; that the bishops and archdeacons held their visitation there; that the church is capable of holding the largest congregation; and, more than all these circumstances, an impression had prevailed among Salopians after the rebuilding of the church on its new and beautiful site at a great cost that the church was as beautiful in its architectural details, within and without, as it was remarkable for its form. If in the earlier part of this century people came to see Shrewsbury they went first to St. Chad's, and the sexton who had custody of its key held the most profitable office of its kind in Shrewsbury. Among the country people who come only occasionally to the town, I find that this superstition has not wholly died out. That St. Chad's has indeed been since its foundation one of the chief churches of Shrewsbury there can be no doubt, but that it cannot have been the mother church is clear for the following reasons:—St. Chad died in 672. This was about a century before Shrewsbury passed out of the hands of the Welsh princes into those of the Mercian, and we cannot place the foundation of St. Chad's Church earlier than about 780. Well, then, was Shrewsbury at that time a Christian town or not? There can be no doubt, I think, whatever that the town was Christian while the Welsh princes held it, and that the Mercian kings had become Christian before they entered it. There must, therefore, have been churches in it, of which St. Chad's could not have been one. I think that we may fairly maintain, in the new light shed on the British and Anglo-Saxon period, that Christianity, though stamped out by the Saxon invaders over a great part of the island after the close of the Roman occupation, yet never disappeared from Shrewsbury, nor indeed from the greater part of Shropshire. It is quite impossible for me to go fully into the proof of this assertion now, but I do not hesitate to make it. Then look beside at the site of St. Chad's old church. It is said to have been built where the Lys or palace of the Welsh prince stood, and so did not succeed any earlier church. It was moreover outside the town. I suppose that it is now an accepted statement that the old British town was bounded, after the manner of the Britons, by a wall of earth and stone and a ditch, and that these ran from the castle along the west side of the hill to the bottom of Pride Hill, then across to the top of the Wylecop, and then returned to the castle along the east edge of the hill; that the town ditch or bailey ran along High Street; that a pool existed south of it where now lies the market-place, and that no part of St. Chad's parish lay within the town.

What churches had the inhabitants in the British days? I suggest that there were at least three, of which two survive.

9. One of these was in all probability St. Julian's or St. Juliana. I conjecture this partly from its singular dedication. It is a very rare one in England, if indeed any other exists. It is not at all likely to have been introduced by the Anglo-Saxons, who rarely used other than scripture names. Nor if founded after St. Chad is it likely that the dean and canons of the larger and more powerful foundation would have suffered so large a portion of the town, so closely adjoining them, to be severed from their control. St. Juliana was an early saint of Asia Minor, at the very beginning of the fourth century, and though unlikely to have been chosen by the Anglo-Saxons, not

at all unlikely to have been respected by the Britons. We still find in Wales a great number of saints belonging to the list of martyrs in the far East and South, whose names were honoured in the dedication of churches from the earliest introduction of the faith into this island. And besides its dedication pointing, as I think, to British times, there is its position within the old town, and the probability that more than one church existed within it in the British days, and the absence, too, of any tradition as to its foundation, points to, or at least admits, an early period.

10. We have now but one church left, of the history of which, however, very little is known, but concerning which much may be gathered from the circumstances attaching to it—I mean St. Mary's. I think that I have proved with regard to eight of the ten churches that no one of them can possibly have been the earliest, unless we suppose that Christianity in Shrewsbury did not survive the departure of the Romans. St. Julian's, I have said, may possibly, nay probably, have belonged to the British Church, by reason both of its site and its dedication; but both by reason of its dedication and its site it must yield in priority of foundation to St. Mary's. While All Saints and St. Peter, and perhaps St. Andrew, are the commonest of all Anglo-Saxon dedications, St. Mary's is, beyond all doubt, the most common among the Britons. None came near it except St. Michael. Llanvair and Llanfihangel are, I suppose, the most frequent titles at this day in Wales, and Llanyelian is not likely to have been set up until after the title Llanvair had been appropriated. And I have already hinted that St. Michael in the Castle may have been of British nomination, too. By such conjecture we should have three churches founded in the old town before the Anglo-Saxon invasion and the extension of the Mercian kingdom to Offa's Dyke. And when you look at the position of St. Mary's Church, in the very centre of the earlier town, and when parishes came to be defined, occupying in its cure of souls more than half the town area, and with a burial-ground extending at one time from the centre line of Castle Street to the very doors of the houses now occupied by Mr. Rope and Miss Hawkins, that a peculiar jurisdiction had been assigned to it from the days of King Edgar, not extending, as a similar right once did at St. Julian's over its own parochial area only, and soon to be lost, but still existing and extending over six other churches, that, before the Reformation, assemblies of great and even national importance were held within its walls, as in the reigns of Henry III. and Edward I., that besides its own churchyard-cross, the central or high cross of the town stood at the corner of its churchyard, that there is good evidence to show that the very ancient parish of St. Michael in the Castle was formed out of lands once within the limits of St. Mary's—when you look, I say, to all these circumstances pointing in one direction, with nothing to set against them except that the origin of the church is lost in obscurity, a truth which points two ways, you are left, I think, in face of this conclusion, that of all the existing ecclesiastical foundations in Shrewsbury, the earliest must have been St. Mary's.

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

THE NUREMBERG VIRGIN.

(*Concluded from page* 326.)

HAVING obtained this information, we went to the spot pointed out by Dr. Mayer, which was exactly such as is described in the chronicle. In face of the street called the Sieben Zeiler, and not far distant from a building called the Banner Haus (where the civic feasts were anciently given), stood one of the bastions in the town wall. It was what engineers call a full bastion, and the terre plein, instead of having an interior slope, was scarped off perpendicularly and revetted with stone. In this revetment was a small old-fashioned door. Through this we descended by a flight of about forty or fifty steps into the casements of the bastion. I found a sort of recess or chamber formed by the projection of one of the counterforts of the town hall. In this chamber there were joists and rafters and other indications of a planked floor having been formerly there, and, indeed, it is extremely probable that this spot was used as a sort of waiting-room to the vaults in which the Virgin stood, it being almost immediately opposite to the door of the passage which leads to them. Through this passage we entered the chamber where the Virgin received her prey. This chamber was perfectly dark; near the centre of the floor was a square hole, and on the sides of it were the remains of hinges, which showed that it had been formerly covered with a trap-door. In a line with this hole I remarked, on the opposite wall, four holes, the position of which made it evident that some important piece of machinery had once been fixed there. Immediately over the square hole in the floor was a reel fixed into the ceiling, such as might be used either for suspending a lamp or for letting persons down into the vault beneath. This I found to be of much greater size than the upper vault. Having no ladder or other means of descending, all I could do was to let down a strong light at the end of a string, by means of which I was enabled to see its interior. It was arched like the upper chamber, and on the ground of it lay beams and large pieces of wood, showing clearly that a construction of no ordinary dimensions had once existed there, and being such as might very naturally belong to such a machine as had been described to me by Kiefer and Dr. Mayer. The grave also which had been mentioned by the former was to be seen. The woodwork, and everything which lay on the floor of this place, was in a state of great decay, owing to a quantity of water which had accumulated on the floor; and, although no stream runs through it at present, it is not at all impossible but that there might have been one formerly, or that there might then have been a means of letting water flow through the vault for the purpose of washing away the blood or whatever else, without some such means of cleansing, would have created an intolerable putrescency. I ought not to omit to remark that a corner of the upper one of the vaults which I have been describing was occupied by one of those torture benches called fiddles, similar in every respect to the one seen in the subterranean chambers of the town hall.

Having inspected all that was to be seen, we returned homewards. I could not, however, help remarking that if the persons intended to suffer death or torture in this horrid apartment entered it in the same way as ourselves, their so doing would be hardly consistent with the intentions of those who had constructed it; for it was evidently not intended to be an appendage to any system of public justice, but must have been the slaughter-house of some tribunal which executed its decrees in secret. It therefore seemed as if the apartment in question must have been approached through the blocked-up doorway, which must have led thither from some prison or other building of importance; and from what I afterwards heard (from a person whose name I am not at liberty to mention, but whose education, means of information, and respectability would give credit to any testimony) I found that my conjecture was correct.

The person to whom I have last alluded pointed out to me the Banner-house, which I have already stated to be at no great distance from the entrance-door of the vaults which I had been examining. "This Banner-house," said he, "has cellars underneath it, and in one of them there is yet remaining a small door. On passing through it you find yourself in a narrow passage. Go on a few paces and you will find two or three steps; mount these, and you enter a small semicircular room, in which is yet to be seen a stone table with seats. Pass onwards through this chamber, and you will be obliged to descend steps similar to those by which you arrived at it, after which, on proceeding a short distance, you will arrive at a doorway, now walled up, but which formerly led through the casements of the old fortress to the chamber where the Virgin was deposited." Having thus established the fact of the Virgin's existence by hearsay evidence, and confirmed it by the testimony of two intelligent living witnesses, who corroborated each other, I was obliged to rest contented for the time with the progress of my researches, and to trust to chance for enabling me at a future moment to find out the machine itself. Before I left Nuremberg, however, I tried to find out whether there was any well-known instance of a person who had suffered by the Virgin. The reply I received was in the negative; and the absence of such instances was accounted for by the proceedings of the tribunal to which the Virgin belonged having been always secret. But I was told that there was in existence an old Nuremberg ballad, the subject of which was a runaway match between a patrician girl and a plebeian youth, who, as the song goes, was made to perish in the arms of the Virgin by the family of the wife, as an expiation for the offence he had committed in dishonouring it with his lowly alliance. As, however, I could not procure a copy of this ballad when I was on the spot, and as I have never been able to find or hear of it since, and more particularly as the time to which it relates was said to be previous to the fourteenth century, I am inclined to doubt its authenticity, for there is some reason to believe that the Virgin did not exist in Germany before the fifteenth century.

It was not until the year 1834 that I obtained any further information about the machine in question. At that time I made an excursion to Vienna, and passed through Salzburg. In the castle at the latter place I was shown a torture-chamber, where I was assured that a Virgin had formerly stood, and an Austrian sergeant who showed me over the place, an intelligent man, assured me that this engine was at that time deposited in the Imperial Arsenal at Vienna. The torture-chamber at Salzburg was situated in a small square tower. Like the vault at Nuremberg, it had a trap-door in its floor into a still larger chamber underneath, but this had evidently never had any machinery in it like the inferior vault at Nuremberg. Both chambers at Salzburg were sufficiently well lighted, and I am

much inclined to think that the undermost one was merely a room where culprits were obliged to wait until they were hauled up out of it to be examined in the upper one.

At Vienna I did not fail to make inquiries at the Imperial Arsenal concerning the Virgin which was said to have been deposited there, but the persons who had the custody of that building assured me that no such engine was in it, nor to their knowledge in Vienna. Many persons of the better class to whom I spoke on the subject denied that the Virgin had ever existed in Austria; but my *laquais de place* and others of the lower class told me that when they were young it was said to be standing in a tower which hangs over the canal that runs through Vienna into the Danube, and that whenever the water there looked a little red (as was usually the case after a storm) nothing was more common than to hear people say, "So the Virgin has been at her work again."

At length I learnt accidentally in conversation that a specimen of this terrible machine might be seen in a collection of antiquities belonging to a certain Baron Diedrich, and kept in a castle called Feistritz, which he had purchased on the borders of Steirmark, and which he very politely permitted me to visit. A predilection for the relics of past times and a very considerable fortune have given to the proprietor of this castle the disposition and means of assembling there a great quantity of ancient arms and armour, furniture, books and other things of an interesting character, but the history of his becoming possessed of the Virgin is particularly worthy of attention.

"I bought it," said he to me, "of a person who obtained it, with the left hand, during the French Revolution, and had with it great part of the contents of the arsenal of Nuremberg. From him I received it in a cart with several things which had formerly belonged to that arsenal. It came to me rusted and in bad condition, deprived of its machinery, but accompanied by the pedestal on which it now stands."

Now let the reader look at the figures, which represent accurately the Virgin in question, and he will see something very like the costume of Nuremberg in the sixteenth century, which is precisely the epoch when the Virgin is said to have been constructed there. Let him also understand that the Virgin represented by the drawing is just 7 feet high, Nuremberg measure, and is made entirely of iron, and then I think he will agree with me that the Virgin in the possession of M. de Diedrich must be the same machine which stood formerly in the subterranean vault of the before-mentioned city. When I saw it, it was placed on a sort of low wooden pedestal, hollow and square, which, as I have before said, accompanied the machine itself into the hands of its present possessor.

The construction of the figure was simple enough. A skeleton, formed of bars and hoops, was coated over with sheet-iron which was laid on and painted so as to represent a Nuremberg citizen's wife of the sixteenth century, in the mantle then generally worn by that class of persons. From the figure representing the interior of the machine the reader will see that the front of it opened like folding doors, the two halves of the front part of it being connected by hinges with the back part. On the inside of its right breast are thirteen quadrangular poniards. There are eight of these on the inside of the left breast, and two on the inside of the face. These last were clearly intended for the eyes of the victim, who must have therefore gone backwards into it, and have received, in an upright position in his breast and head, the blades to which he was exposed. That this machine had been formerly used cannot be doubted, because there are evident blood-stains yet visible on its breast and on the upper part of its pedestal. How it was worked is not known, for the mechanism which caused it to open and shut is no longer attached to it, but that there was some such mechanism is clear from the holes and sockets which have been cut out on the surface of the pedestal, showing the points where parts of the apparatus intended to work it must have been inserted. It stands at present on castors, and there are two iron springs which its present proprietor has caused to be placed in it, for the purpose of making its sides to open whenever it is moved forward, but this is merely done to startle, by way of pleasantry, those who see it for the first time, and without any idea of explaining the means by which it was anciently made to perform its office.

Perhaps, however, I can throw some little light on this difficulty. In the year 1835 I met at Liège with a very well-educated and accomplished man of letters. He was a Frenchman by birth, and had been attached to the Court of Joseph Bonaparte, when he was promoted by his brother Napoleon to be King of Spain. There my informant told me that he had an opportunity of inspecting the chamber of the Inquisition at Madrid, and that among other instruments with which it was provided he found an image of the Virgin Mary, composed partly of wood and partly of iron. This engine was called "Mater Dolorosa," and with it was administered the last and severest degree of torture. Its ordinary position was that of a woman standing erect, with her arms crossed on her bosom, but there was a contrivance by which she was made to expand her arms, and then the inside surfaces of them were seen to be garnished with a number of small points or stilettes. The person to be tortured was placed opposite to her, breast to breast, and then her arms were brought round his back, and by means of a powerful screwing implement made to grasp him tightly, so as to inflict great pain and to render it impossible that he could fall from her gripe. Whilst she held him thus firmly a trap-door was opened under his feet, so as to cause him to hang in agony over an abyss. In this position he was importuned to confess his guilt, whilst the arms of the machine were slowly and gradually screwed tighter and tighter till life was squeezed out of his body. His corpse was then released, and fell through the trap-door into a sort of *oubliette*. Now I am much inclined to think that the machine in the possession of Baron Diedrich was made to do its inhuman duty somewhat in the same manner as the machine in the Spanish Inquisition—that is to say, its front was probably forced down on the person within by means of some screwing apparatus which is now lost.

Perhaps also the merit of having invented the Virgin is due to the genius of Spain, and it is by no means improbable that it was from thence transplanted into Germany during the reign of Charles V., who was monarch of both countries. According to M. de Pfeffel ("Abrégé de l'Histoire d'Allemagne," p. 414), there were great tumults in Germany during the years 1531 and 1532, and continual quarrels at Nuremberg between the Protestants and Catholics. "In 1532 was published," says he, "the famous Criminal Code of the Empire, which was the most severe and the least observed in Europe." In 1533 (only one year later) the Iron Virgin was, according to the chronicle cited by Siebenkees, constructed at Nuremberg. This latter fact is sufficiently remarkable, for one may see that, not content with having made a penal law more cruel than the spirit of the German people, the Imperial Government of that day quietly permitted the institution of a punishment not authorised by that law, and too remarkable to escape attention. How is this fact to be explained? One is almost tempted to believe that some member of the Supreme Council of Castile had thus addressed himself to the German ministry of his sovereign, "Gentlemen, you have done your work awkwardly: you have attempted to do in public more than your people are prepared to welcome. You may, however, repair your error. Do in secret that which you may find it inconvenient to do openly; and if you wish to know how, go to Venice or come to us, and you will see that, in our secret tribunals, we get on with our business very well, without being subjected to the inconvenience of shocking public sensibility."

As I have not the means of consulting those books and authorities which might fix the time when this machine was first employed in Spain, I cannot do more than offer, as a bare supposition, my idea that it was received from them into Germany; but I was told by Mr. Gèvay, a learned and distinguished Hungarian in the Imperial Library at Vienna, that he had read of this machine in a Spanish romance of the early part of the sixteenth century, which proves that it was known in Spain at the period in question. The author also of a French romance, published at Paris in 1828, and entitled "Cornelia Boroquia," makes mention of it as Spanish, and this attributes it to the same epoch, for she was tortured, if I remember rightly, in the sixteenth century. Add to this, that it is an instrument much more congenial with the genius of the Spanish nation than with that of the Germans. The latter are not naturally cruel, although they may be sufficiently prone to imitate bad example; and if one examines the German instruments of torture of the sixteenth century he will find them extremely rude and simple, whilst those of Spain are not only better wrought, but have an elegance of form and an ingenuity in their contrivance, which could only come from the hands of persons who could follow and study this kind of manufacture with zeal and pleasure, and be ambitious of the peculiar distinction which a successful cultivation of it might produce.*

* See *Architect*, November 20, p. 325.

* The following extract from Hampton's *Polybius* seems to attribute the invention of the Virgin to Nabis, tyrant of Sparta, who died B.C. 192:—"He (Nabis) contrived also a machine, if it may be called by such a name, an image of a woman, magnificently dressed, and formed in a most exact resemblance of his wife. And when his intention was to draw money from any of the citizens, he invited them to his house, and represented to them the great cost of maintaining the worship of the gods, &c. If these arguments prevailed, it was sufficient for his purpose. But if all his solicitations were without effect, then he used to say, 'I want, it seems, the power of persuasion; but Apega, I believe, will persuade you.' Apega was the name of his wife. Upon these words an image of the woman that has been mentioned immediately appeared. Nabis then taking her by the hand raised her from her seat, and folding afterwards his arms round the person whom he had been soliciting, brought him near by degrees to the body of the image, whose breast, arms and hands were stuck full of points of iron, concealed under the clothes; and then pressing the back of the pretended woman with his hands, by means of some secret spring, he fixed the man close to her breast, and soon forced him to promise all he desired. But there were some also who perished in this torture, when they refused to comply with his demands." Vide vol. ii. ed. Lond. 1772, p. 291.

There can be no doubt that many of these engines were formerly to be found in Germany, especially in corporate cities and in the castles of wealthy and powerful princes, and there can be as little doubt that shame, at the idea of having the reputation of even countenancing a thing so barbarous, has induced, in almost every instance, the posterity of their original possessors to hide or destroy or sell them for old iron, so that one may regard the machine now in the possession of Baron Diedrich as a very great rarity. I have, within the last year, been told of the existence of at least half a dozen; but on making inquiries at the places where they were reported to be present, I have invariably received answers in the negative. I remember that an old Austrian artillery man, who, in 1834, was living at the castle of Baron Diedrich, told me that, when he was a young man and garrisoned at Prague (which was fifty-seven years anterior to the time of our conversation), there was a machine of this kind at the Wenzels-Burg, near that city, and that it stood on the first floor of that building, in a long room, which was then used by the Austrian artillery as a laboratory. This man was nearly eighty years old, but was in full possession of his intellect, and he told his story so simply and naturally that I could have no doubt of its correctness. He said that the machine was made differently to that in the castle, for that it had arms, and that the soldiers used to amuse themselves by making them open and shut, until one day they broke the machinery and so crippled it. He described particularly the place where it stood, and said that he and his comrades and everybody else regarded it as a useless piece of old iron. He added that he himself had never seen any others than the Virgin at Prague and that belonging to his master, but that in his youth he had heard of many, which he could not particularise, because at that time it was generally believed that they existed in every town where the corporation possessed a criminal jurisdiction, although they were regarded as relics of antiquity which had long ceased to be employed.

There can be no doubt, however, that this machine no longer exists at Prague. I was there in November 1834 and took much pains to find it out, but in vain. The keeper of the council-house told me that, some years ago, he had in his possession the instruments of torture and execution which formerly were used by the magistracy, and that there was no such machine as the Virgin amongst them. He said, however, that such an engine was reported to have anciently existed in the white tower on the Headchin, where State criminals were formerly executed in secret. But this tower was in ruins, so there was no chance of finding it there, although I understood from a person who descended into the pit of it that, from the number of human bones to be found there, one might fairly conclude that the office of executioner was no sinecure in former times.

I have since heard, on the evidence of a most respectable eye-witness that, some years ago, there was a Virgin in the castle of Ambrass, near Insbruck, which was furnished with arms like that at Prague. I have heard, also on very respectable testimony, that another similar to the former was, some years since, in the royal castle at Berlin; but I have not been able to ascertain whether it now exists there. Another is said to be standing in a perfect state in the castle of Schwerin; but in this case I cannot rely on my authority as in the others. Probably one might find in Spain other specimens of this machine; perhaps some may exist in Italy, for I have heard that at the close of the war of 1814 there was something very like it at Florence. But in Germany the country has been from time to time so pillaged and overturned by war that it is more than difficult at the present day to lay one's hand on an example, the more especially as the municipal governments there like better to conceal than to avow the existence of such a machine.

But, after having seen the engine in the possession of Baron Diedrich, one can no longer doubt that others of its species were employed as appendages to the ancient tribunals, and one is therefore obliged to regard the story of "The Kiss of the Virgin" not as a popular legend but as history. It is for the purpose of putting this fact in evidence that I have written the present narration. In the course of another hundred years all substantial traces of the machine will probably have disappeared, and then there will be no want of persons ready to treat as false a tradition which, nevertheless, throws a sufficiently strong light on the judicial institutions of the past time.

I cannot close these observations without remarking what appears to me to be a very singular circumstance, namely, that although the word "Jungfernkuss" is familiar to every peasant in Germany, one can neither find it in the lexicons of Adelung and Campe, nor in any other book of that sort which I have been able to consult. One is almost tempted to believe that explanation of the word was forbidden by the censors of the press. Be that as it may, there can be no doubt that the machine was employed in many of the European states, and in most, if not in all, of the Imperial cities, and perhaps its existence is the strongest proof that can be adduced of the danger of permitting tribunals of criminal justice to do their duty in any other place than an open court.

CHURCH BUILDING AND RESTORATION.

Wigan.—The fine church of St. John, built about the year 1820, has been embellished by the erection of new altar-rails of marble and alabaster, and the sanctuary has also been enlarged. The work was placed in the hands of Mr. C. Hadfield, architect, of Sheffield, from whose designs the whole has been carried out by Messrs. J. & H. Patteson, sculptors and marble merchants, of Manchester, and Mr. Preston, contractor, of Wigan. The rails are of bold design and follow the architectural lines of the chief features of the church, being straight in front but curved at the sides, and upwards of 52 feet in length. The balustraded portion is composed of light-coloured alabaster of the finest quality relieved by panels of Seravezza marble. The base and broad capping of the balustrade are formed of richly-tinted and veined rouge griotte, while the step and riser on which they stand is dove marble. The flooring and new arrangement of steps which the rails enclose is laid with pitch-pine boards in patterns, wax polished and partially carpeted.

GENERAL.

Mr. W. H. Hunt's picture, *The Triumph of the Innocents*, which has been purchased by the Liverpool Corporation, has now been placed in the permanent collection.

The Berlin Correspondent of the *Standard* announces that Herr Gustav Spangenberg, the painter, whose most famous picture, *The Procession of Death*, is in the Berlin National Gallery, has fallen a victim to the influenza, after an illness of only three days.

The Institute of Painters in Oil-colours have elected Messrs. Edgar Bundy, R.I., Carlton A. Smith, R.I., William Rainey, R.I., St. George Hare, Leslie Thomson and Anderson Hague, R.I., as members.

Ribera's "Descent from the Cross" has been restored to the city of Dijon, from which it was taken to enrich the collection of the École des Beaux-Arts, Paris.

Rev. C. W. Grove has undertaken to place a series of five stained-glass windows in the north aisle of Tewkesbury Abbey, in character with those he has previously placed in the south aisle.

Mr. Charles Dyall has been elected president of the Liverpool Artists' Club, in succession to Mr. P. H. Rathbone.

A Pastoral Staff, designed by Sir A. W. Blomfield, has been presented to the Bishop of London.

Colonel Harding has been appointed chairman of the Leeds Corporation Fine Art Gallery Committee.

Mr. Mortimer, of the firm of Karslake & Mortimer, architects, Westminster, died suddenly while measuring works in Dublin on Monday last.

Messrs. Bruton & Williams, of Cardiff, have been successful in the competition for the cemetery chapel for the Barry and Cadoxton Burial Board.

The Comte de Figueiredo has presented the Fine Arts Academy of Rio Janeiro with a fine collection of modern paintings which are mainly by French artists.

Mr. A. P. Laurie, M.A., will on Monday next deliver his first Cantor Lecture at the Society of Arts, on "The Pigments and Vehicles of the Old Masters."

The Design of Mr. John Jackson, architect, Barry Street, Westgate, Bradford, has been accepted in public competition for the new Baptist Chapel at Heaton.

Dean Argles has offered 500*l.* towards the removal of the organ to the triforium in Peterborough Cathedral and the purchase of a small organ for use during the reconstruction of the great organ. Stalls for the choir have been accepted from the Freemasons of England, the Corporation of Peterborough and Mr. Gates, the chapter-clerk.

Convocation at Oxford has voted a second sum of 25*l.* towards the cost of the antiquarian excavations at Chester, which, as the Provost of Queen's observed, were throwing great light upon the obscure period of the military occupation of Britain in the time of Agricola, and were a matter of great interest to Professor Mommsen.

Crowland Abbey Restoration Works, suspended some time ago for want of funds, are again in active progress. Two of the arches which carry the steeple were in a most dangerous condition; but these are now being made safe, and the bell-chamber, it is hoped, will be sufficiently strengthened as to admit of the fine old peal of bells being rung again at Christmas.

An Inquiry has been held at Buxton as to the application of the Local Board for sanction to borrow 3,283*l.* for works of sewerage, street improvements, surface drainage and water supply, 1,200*l.* for works of gas supply, 485*l.* for public walks and pleasure grounds, 432*l.* for road rollers and water vans, and 350*l.* for construction of a bridge. No objections to the proposed works were submitted.

The Architect.

THE WEEK.

IT takes a long time for English ideas to go through that process in American brains which ends in action. One example may be cited. The Committee of the American Institute of Architects have decided to print all papers that are to be read at an annual convention, and circulate them among the members in order to facilitate discussion. This is supposed to be a happy thought, which has gained much credit for the Committee on account of its utility and novelty. For our part we are glad to hear of the arrangement, for it originated in the course of some advice we proffered to the American Institute nearly five years ago. In an article published in *The Architect* on January 7, 1887, about one of the conventions, it was said, "Papers are essays, and if they contain information it is more likely to be rendered profitable if the student can read them at leisure. If the subjects are of pressing interest it is unwise to have the papers suddenly sprung upon a meeting. They should be distributed beforehand in order that members might be in a position to discuss them. It is not everybody who is a ready speaker, and in consequence the discussions of papers in most societies is generally left to a few members and ceases to have much sincerity." It would have been wiser for the Institute to adopt our plan much earlier, but in that case the Committee could not so easily gain a reputation for originality.

THE contest for the seat in the Académie des Beaux-Arts rendered vacant by the death of ELIE DELAUNAY did not last long, for at the first turn M. JULES LEFEBVRE secured twenty-four votes from the thirty-five members who were present. The other candidates were MM. JOSEPH BLANC, EDOUARD DETAILLE, LUC-OLIVIER MERSON and AIMÉ MOROT. M. LEFEBVRE is one of the successful figure-painters of Paris. His works are admired in other places, for his *Diana* was purchased by a Glasgow merchant, who paid 1,500*l.* to secure it. M. LEFEBVRE comes from Amiens—the city allowed him 40*l.* a year—and was one of the numerous pupils of COGNIET. After a fourth trial he gained the Prix de Rome. Few holders of the prize worked harder. Among the works he produced was a copy of ANDREA DEL SARTO'S *Last Supper* in the refectory of the convent of St. Salvi, Florence, the one work which can be mentioned with DA VINCI'S masterpiece. Since his return to Paris M. LEFEBVRE has gained admiration by his paintings of the nude figure and his portraits. He is head of one of the great ateliers of Paris, where he endeavours to develop the individuality of his students in preference to making them imitators of his own style.

COVENTRY stands in need of a second Lady GODIVA, who, like her predecessor of a thousand winters back, can undergo and overcome, thus building for herself an everlasting name. This time it is not a grim earl, "his beard a foot before him, and his hair a yard behind," who is to be prevailed with, but prosperous landlords and successful manufacturers. The old part of the town is still picturesque, and it is a pleasure to ramble through the streets and lanes, although everything exposed for sale in the ancient shops is terribly modern. But picturesqueness and sanitation do not always go together, and the local medical officer of health, regarding the town from the official point of view, is compelled to draw a picture of Coventry which contrasts strangely with those of painters and photographers. In his last report he says:—"Coventry, like many towns similarly built, contains a large number of dwellings which are so constructed as to prohibit the possibility to the inhabitants of them of living healthy lives. A house cannot be wholesome unless the two great vitalising elements, light and air, are admitted into it, and in Coventry there are no less than 3,106 houses, where this cannot be satisfactorily accomplished, owing to the manner in which the houses are crowded together, the lowness of the ceilings, to the small size of the doors and windows, which are situated on one side of the house only, and also to the fact that many houses are so subdivided internally, in order to increase the sleeping accommodation, that some rooms have neither windows, fireplaces or other mode of ventilation, and at night are like closed boxes." There is no exaggeration in the description which is applicable to many other towns that on the outside are fascinating to all who are wearied with modern structures, which, if well drained and ventilated, are deficient in the witchery of light and shade. What is to be done with houses like those of Coventry is difficult to discover. There can be no doubt that they help to keep the death-rate high. The rents, however, are low, and the inhabitants poor. The manufacture of cycles has created a new Coventry, which a sanitarian would consider to be satisfactory; but the surviving representatives of the trades which have fled to other towns cannot become tenants of bright red-brick houses. When one tenant of the antiquated domiciles passes away, there are unfortunates who are willing to take his place, although the "house" may have no back door or back window. The inhabitants of the new streets do not care to pay for remedying the faults of the old builders; the owners of property will not introduce improvements for which they will receive no return. The case is complicated, and, as we have said, a Lady GODIVA is needed.

IT is to be hoped that the speech delivered this week at Douglas by the Bishop of SODOR and MAN is a forerunner of episcopal co-operation with all who desire to see English churches fitly adorned. His lordship said that there was an illusion abroad that the Church and art, if not antagonistic, were at best mutually indifferent. It would be sad and strange if this were true. The Bishop asked whether one of the characteristics of the human race was not that everywhere pleasure was taken in combinations of form, of colour and of sound, a pleasure which became extended as their perceptions became enlarged? Would it not be strange if religion, which sought to touch men at all points, should have nothing to say in regard to this universal instinct? The true artist was no mere painter to accumulate facts upon canvas or to reproduce in colour what all men could see for themselves. He had to gain the ideal of his subject, and then to present it in an intelligent shape. He had to give the right effect, and then to call out the right feeling. Would it not be sad indeed if for such art the Church had no words of sympathy? He was bold to say that if art had love for its motive, truth for its object, and the discovery of truth in its aspect of beauty for its aim, then such art became not only a handmaiden to the Church, but an ally and an associate. To turn from the ideal to actual history of the past—Was not modern music a creation of the Church? Had not architecture in all its exquisite forms been developed to supply her needs, and had not the gospels and other illuminated works of devotion found their crowning glory in the art of MEMLING and VAN EYCK? Perfect art tended to destroy superstition. He claimed for the Church that in the past she more than all other agencies combined popularised art. But as SHAKESPEARE says, what is done in the present, though less, must o'ertop what was done in the past. There is no denying that art was at one time enabled to offer gifts which were accepted, but when it is found that churches can only be decorated with painting and sculpture in fear and trembling, on account of apprehensions of episcopal opposition, how can the English Church be taken as loving art?

THE *Architectural Review*, of which the first number has appeared, is an interesting and welcome addition to the technical literature of America. It is contended by the promoters "that the art of architecture [should deal primarily with conditions, not with precedents; that those conditions are physical, and should appeal to the eye more than to the memory, and that architecture should be organic and logical before it should be reminiscent; that it is an intellectual more than an emotional art, and finally, being distinctly artificial, and acknowledgely so from the first, it is more than absurd to mask it with realism." The upholding of the principles will afford opportunities for clever writing. One of the features of the first number is an elaborate description, with drawings, of Wenlock Priory, by Mr. H. LANGFORD WARREN. The *Review* is to be published eight times a year. The first number is creditable to all who have taken part in its production.

ARCHITECTURE AND SCULPTURE.

THE ancient philosopher who declared that the triangle was the symbol of beauty because it exemplified multeity in unity, might have taken his ideas from one of the buildings in Alexandria. There he must have seen architecture, sculpture and painting combined to produce a whole that was believed to be perfect. To his mind the absence of one of the arts would be the severance of a quality by which beauty vanished, harmony became discord, and reason lost its power. In buildings, as in other productions, the Greeks delighted in the skill by which different forces were controlled and made to serve one end. Their great epic has more variety than the volumes of a modern miscellany; there is even room in it for a THERSITES. Their best thinkers were charged with plagiarism, and with some reason, for they tried to be encyclopædic. When the temple became an institution in which the citizens were concerned, all arts were made to contribute to its magnificence, but subjected to that instinct for proportion and measure with which the Greeks beyond all men were endowed.

To what extent painting was utilised can only be imagined. The colours used by Greek artists were probably few, but for decorative purposes painting could be supplemented by embroidered stuffs. It is unnecessary to say that sculpture was used, not as an adornment that was extraneous, but as if it were indispensable to have a large part of the masonry wrought into figures. Single figures like those now scattered throughout the world were also likely to be used, at least in Greece, to give effect to the buildings containing them.

With the Romans there was, no doubt, more license in using the arts. Some of the buildings were overcrowded with sculpture, but what could be expected when so many works were brought to the city as spoils? The paintings on the walls, which were as bright as gold and vermilion could make them, must have been painful to the eyes of Greek visitors. But what is clear is, that the Romans, who were not destined by nature to be artists, yet possessed sufficient masculine sense to perceive that their buildings would be more pleasing if painters and sculptors co-operated with architects in completing them. It certainly is remarkable, as an indication of Roman desires, to find the people who were driven into the catacombs, many of them being humble folks, and who were convinced that their lives were most precarious, lost no time in adorning their place of refuge. The very simplicity of the figures, which seem to be the work of amateurs, who could only adapt pagan forms, suggests the prevalence of a belief that the walls of every important chamber were incomplete if they did not display some sort of ornamentation. As evidence of the tendency of the time, the catacombs are no less useful than the retreats of Pompeii, where little but artists' work is to be seen.

In the Byzantine period the painters' work did not fall out of favour with patrons of architecture. Mosaic was only a development of it, used to gain more effect. The old traditions about the necessity of sculpture were respected, and it is related that no less than four hundred and seventy statues were set up at one time in St. Sophia. Need it be said that during the Mediæval times architecture, painting, and sculpture seemed to be different species of one art, rather than three independent arts?

Some apology is needed for inflicting the foregoing scanty review on the reader. It has been given in order to show if possible with more clearness when the change took place. For all who have cared about the history of art must be aware that the old traditions do not support a belief in the superiority of architecture which depends for effect on the work of the mason, without other adornment. That noble buildings can be constructed without aid from subsidiary arts, must be admitted, and cases arise in which a severe treatment is desirable; but the majority of buildings would be better for that aid.

It is not easy to discover how the neglect of painting and sculpture could have originated. During one part of the Renaissance the buildings were designed by painters and sculptors. It might be supposed they would turn their own work to account, but there were causes at work against them. The painters, when they found that, under new conditions of control, it was not necessary to paint on the walls of a church, and that a picture in oils was more acceptable, naturally devoted themselves to the latter class of work. It was easier, and far more satisfactory, to paint in one's own workshop than to toil at frescoes under the criticism of priests or monks, and at their dictation. The stories which are related about the disagreeable encounters between the Pope and MICHEL ANGELO about the Sistine Chapel, between the Dominican prior and DA VINCI, to say nothing of the more legendary treatment of CORREGGIO by the canons of Parma, reveal a change in the relations between painters and one important class of patrons. Fresco pictures were more and more neglected, and in course of time wall-painting may be said to have become one of the lost arts.

There was another reason for the change. The ancient buildings of Rome no longer exhibited the colour in marble, mosaic and painting which at one time characterised them. In consequence, people easily assumed that plain stone in its natural colour was the proper material for a building. So strong was the belief, that many people in RAPHAEL'S time were sceptical about his discovery of fragments from the Baths of Titus which were covered with arabesques. It was supposed that the ancient Romans could not have tolerated so frivolous a treatment of the walls of a public building. This becomes more evident when it is found that the decoration which RAPHAEL and his assistants derived from the fragments, and employed in the loggie of the Vatican, did not find much favour in Rome.

Architectural sculpture in its history during the Renaissance in Italy bore some resemblance to the history of wall-painting. Even when he produced single figures in his own *bottega* a sculptor was at one time willing to sink his own personality out of a desire for fair play to the men who co-operated in other ways in erecting or decorating the building in which his work was placed. DONATELLO did not put his name on his statues of *St. Mark*, *St. Peter* and *St. George*. It was the applause gained by the figures which induced him to sign his *Judith* which was for the senate house. The question which he addressed to one figure, *Marco, perchè non mi parli?* suggests that he regarded it as not entirely his own. The setting up of single figures in public places made sculptors indifferent to all people but themselves, and, with independent commissions, they could hardly be expected to pine for days when they were as units in a crowd. The old ways are suggested by the eagerness of DONATELLO to depart from Padua, where he heard nothing but praises. He feared he would become enervated. But DONATELLO was almost the last of the school. The new race accepted praise as a tribute, and it would be risky for any architect to offer suggestions about one of their works. There are writers who hold that Paganism—that is, naturalism—was fatal to painting in Italy. With more reason it might be said to have put an end to architectural sculpture, for the delight in figures of mythological personages created patronage, and sculptors were drawn away by it from buildings.

The best representative of the architectural sculptors in the sixteenth century was not to be found in Italy but in France, in the person of JEAN GOUJON. Like some of the Italians, he was also an architect, and the Hôtel Carnavalet, which served as a residence for Madame DE SÉVIGNÉ, was, it is said, designed by him. GERMAIN PILON was another sculptor who was a master of decoration.

It is not necessary, however, to follow out the history of sculpture in either France or Italy. The artists who were most fortunate in gaining the favour of the public did not care about employment on buildings, but they helped to create a crowd of men who were not unwilling to execute architectural sculpture. In France the influence of the sculptor's art is to be traced in the humblest classes of decoration, and to it, rather than to painting, the country is indebted for its success in the markets of the world. As was said by Mr. WESTMACOTT, R.A., "the mere fact of the extensive employment of sculpture wherever it can be introduced proves that it is almost a requirement in France, and it is inconceivable that an observant and acute population that has con tantly before it works of art should not be improved by such association." Whatever kind of sculptural decoration may be required by a French architect he can readily find men to undertake it, and his

client is not unwilling to pay for the work as if it were a necessity. Nor is France the only country where the art is in request. In Austria there seems to be a larger demand for architectural sculpture than in France. As for Germany, it may be said that if the figures were removed from many of the new buildings little would be left to attract the eye. The sculpture compensates for the rigidity of the architectural lines—for, from the cast-iron accuracy of all parts of the masonry, it might be supposed that it came from a foundry; so that what SCHILLER says is applicable in a sense he did not anticipate, for the stone might have been melted—"der Marmor schmelzen unter Hammerschlägen." It is not necessary to inquire whether all the architectural sculpture that is visible on the Continent is according to the highest canons of art. The sculptors very often, like their Italian predecessors, are indifferent to general effect, and make their figures too obtrusive. But if architects cannot exercise adequate control over all who aid them they are not fit to exercise their office.

In England, so strong is prejudice, it is difficult to make people understand that sculpture is useful for any purpose except the production of portrait busts and statues that will increase the dismalness of public places in towns. The prohibition of graven images among the old Hebrews still makes good people cautious about sculpture, however innocent. The art fell into disuse when the occupation of the men who worked for churches came to an end under HENRY VIII. It might be supposed that the coming of a great artist like TORREGIANO would bring about a revival of interest in sculpture. For a very brief period his influence was beneficial, but the apprehension of spiritual danger was too strong to make people take delight in figures. The art was again neglected. Whenever sculpture became a necessity—as for monuments or for buildings—the work of native masons was accepted, unless in exceptional cases, when orders were sent over to the Low Countries. The ignorance on the subject is revealed by the writings of Sir HENRY WOTTON. He was desirous to exhibit some of his connoisseurship to CHARLES I.; but while he waxes eloquent over the pictures, he was unable to say anything definite about the statues. The great NEWTON could not understand what men saw to admire in "stone dolls." Many years in consequence passed away before an Englishman appeared who was willing to study the art until he deserved to rank among the sculptors of France and Italy.

When at last sculpture was recognised in England as "a very serious business," for so REYNOLDS described it, there was a belief that to work on buildings was unworthy of any one who could produce figures of gods and goddesses. Architectural sculpture was relegated mainly to foreigners. It was taken for granted that an inferior class of work would serve in buildings, and of course the prices paid were not much beyond the wages of stonecutters. The belief has not entirely passed away. The statuary of the Houses of Parliament was produced at the cheapest rates, and there are people connected with prominent buildings who appear to think that a sort of tombstone carving would be adequate. Too many examples of such imperfect work are visible in the metropolis.

At the present time the worst obstacle to the introduction of sculpture is still that of cost. Architects would often be glad to avail themselves of so efficient a means to increase the interest of their buildings if the financial difficulties could be got over satisfactorily. The majority of English people, when they buy a work of art, at once begin to think about the sum it would reach if put up in an auction-room. Sculpture does not, as a rule, appeal to purchasers in such a place, and in consequence there are often sacrifices. But a piece of sculpture fixed on a building cannot be removed, and it has hence not much market value. We may regret that people who build have not more appreciation of the art, but who is to educate them or convince them of their error? We must take the world as it is, and at the present time an architect who insisted on sculpture in a building would be likely to discover that he was risking the loss of a client. There are, no doubt, many sculptors who are prepared to exercise much self-denial in order to reconquer a province that once belonged to their craft, but the public will not be tempted, and until there is a change in opinion it is impossible to see how architectural sculpture can be advanced.

AN ARCHITECT'S VERSES.*

IT is rather unusual for an architect to express his thoughts in rhyme or other metrical arrangement, and in all the preceding volumes of this journal there is no account of an experiment of the kind. Those who cannot resist the impulse (which is natural to all men) and must use burning words, no matter whether they unite in songs or sermons, and the still larger number who, like Mr. WEGG, in a more subdued yet friendly way, drop into poetry, alike keep the inspired results from all but their most trusted friends. It may be through a fear of the consequences, for as the song says, "Dichter sind Schmeichler," and nobody wishes to be bamboozled into giving commissions. Practical people may also imagine that an architect cannot write sonnets and specifications with equal attention; contractors, too, would be certain to add on a large percentage to tenders if they knew they were to be addressed in blank verse or were to receive heroic epistles. It is, therefore, perhaps prudent to sacrifice reputation for poetry to fees, although of course many architects could with ease ascend to the uppermost height of Parnassus as easily as they mount to roofs. Clients must be served, and as they will have prose without even a figurative expression, the Muse's sons can therefore only give way to the *amabilis insania* in secret, and the Orphic rites have no sympathetic witnesses.

Mr. COTTON, of Birmingham, appears to be curbed by the fear that he may be doing something unprofessional, and when poetising in his volume of lyric and other verses hardly does justice to his talent. He is like a man who has had a chance to design a castle, but prefers to keep to a cottage. His poems are so quiet as to be almost unemotional; one cannot find fault with them, but they do not make the blood run quicker or pleasurably disturb us. The passions which moved poets from the first prattlings of unquiet men who could feel rather than speak are kept at a distance. Mr. COTTON is as safe as if his book were a competitive attempt to be judged by a jury of Miss PINKERTONS. His first verse affords a key to the volume, and he aims at giving the sort of calm he desires to find in an author himself. As he says:—

> How sweet it is, when care invades—
> Or weariness—to seek the shades
> Luxuriously cool, which lie
> Beneath the leafy canopy
> Of some umbrageous elm or beech,
> And there reclining, out of reach
> Of galling sunbeams, soothe the time
> Pursuing some loved poet's rhyme,
> Whose gracious utterance can control
> The perturbations of the soul,
> Awaken hope, and to the heart,
> A pleasurable peace impart.

In so idyllic a spot the rhyme or reason of any "half-mad, half-fed, half-sarkit" poet like BURNS would be out of place, as well as the words of others who wrote out of their hearts' fulness as if they were compelled to be communicative. Mr. COTTON admires BURNS, and writes about him in a manly and reverential spirit; but as architects sometimes have to appear as devotees of a style which is not theirs by choice, so in the present case we find LONGFELLOW is looked up to as an inspiring influence rather than the "rustic bard" who, in his simplicity, imagined that the light which led him astray was "light from heaven." In addressing the American poet Mr. COTTON speaks like a disciple, but one whose love is measured on principle:—

> I love thy rhymes, sweet singer, they awake
> Responsive echoes in this breast of mine,
> For ever, as I hear or read, with thine
> My thoughts in kindred unison combine;
> Yet thought of mine did never yet forsake
> My brain conceived so happily, or take
> Shape eloquent in such wise words as those
> With which thou dost thy sentiments disclose.
> Music doth seem to lend thy poesy
> Her choicest charm; for blending with thy rhymes
> And ancient legends of romantic times,
> Pathos and harmony—in just degree
> Uniting—perfect thy sweet minstrelsy.
> I love those old-world stories thou dost tell
> And love for them begets regard for thee.

* *Song and Sentiment: Lyrical and other Verses.* By John Cotton. London: Simpkin, Marshall & Co. Birmingham: Cornish Brothers.

The master, for so we must consider LONGFELLOW in relation to Mr. COTTON, was never more successful than in dealing in a sort of *belles-lettresish* manner, and according to the rules of a sentimental rhetoric, with old German scenes. Mr. COTTON hesitates about following him there, for very few of the poems relate to Germany. The best is a free translation of SALOMON'S "Fiducit," which relates the fate of the three collegians who loved each other, but were indifferent about the rest of the world. Here it is :—

There lived three genial fellows once,
Friends of a kindred soul,
They dwelt in the same house, and quaffed
The same enlivening bowl.

In festive bouts of gay delight
Their jovial youth was spent,
And nought of mortal misery
Disturbed their blithe content.

At length one comrade passed away,
And soon another died ;
Till, reft of all companionship,
The lone one sadly sighed :

Sighed day by day till night came round,
When they were wont to meet ;
Then filled the flagons as of old,
And placed each friend a seat.

Presiding at the social board,
As though the dead were near,
He sang the old songs o'er, until
His eyes wept many a tear.

One night he cried, "A health ! a pledge !
Why sit ye both so still ?
I drink to you, and stake my life
For friendship and goodwill."

Then clanking cups two ghosts arose ;
Rose solemnly, and said,
"*We take thy pledge*," and at the words,
He fell before them—dead.

It is in a different spirit Mr. COTTON and his friends enjoy or endure life. The "Epistle to a Friend" (a brother architect) represents not only the author's experience, but, we hope, that of many others who find that the love of art is enhanced when it is shared by kindred spirits. We can only find room for the following passage :—

How swiftly flew those intervals away,
Gleaned thus from winter's dilatory day,
When, by thy happy hearth, we turned the page
Of some loved writer, eminently sage ;
Some native poet, perhaps, whose lofty lines
And teeming fancy, charged with high designs
Of noble tendency, our souls set aching
To be in such exalted schemes partaking.
And when, by chance, the conversation turned
Upon our own vocation, how we yearned
For opportunities to teach all time
What constitutes the perfected sublime
In that majestic art—of arts the first—
Grand Architecture, from whose lap are nurst
Transfiguring Sculpture, and her sister mild,
Painting—ideal Imitation's child.

Deserves she not priority of praise
For her solicitude, through lengthened days
Concerning these her kindred, who depend
Upon her care as on a fostering friend ?
Shall either her superior claims condemn,
Whose presence is so vital unto them ?
No ! rather let their just regard be shown
In heightening her attractions with their own ;
United thus, while future ages roll,
They each shall charm the cultivated soul ;
The willing world, surrendering its fields
Shall court those beauties Architecture yields,
And proudly elevate each sheltering dome
That offers Man, and Art, a fitting home.
For Architecture, with creative skill,
Can mould chaotic matter to her will ;
Give it fair form, and make that form conduce
To earth's adornment and to human use.
Kind Nature, too, the lovely and all wise,
From whom our happiest inspirations rise,
Presenting ever an inviting face,
Shall lure fond Painting to depict her grace ;
While Sculpture, in a more material way,
With imitative skill transforms the clay,
And to the yielding marble deftly gives
An aspect that to outward seeming lives.

But what say'st thou, my friend, these fancies seem
As fond, I fear, and idle as a dream ?
For we, unfortunate, denied elsewhere
To raise fair domes, can build but in the air ;
This Age commercial something cheap requires,
And flouts at fine designs and great desires.
Art is so coy and tardy, time so fleet,
We scarce have caught her smile ere we must meet
Lugubrious Death, who, with scant patience waits
Our coming, where she leaves us, at the gates
Of blind Oblivion, perhaps ; whose silent cave
Yawns 'neath that wormy Golgotha, the grave.

It is said by WORDSWORTH that poetry takes its origin from emotion recollected in tranquillity, and the latter may be said to pervade the greater part of Mr. COTTON'S book. We seem to have a survival of that placid, home-loving, contented spirit which was exhibited in the last century, in the verses of the Dr. COTTON whose kindly manner was beneficial as a restorative to the unhappy COWPER. There is no affectation of exceptional power, no attempt to gain sympathy by an exaggeration of the ordinary sorrows of human kind, and no assumption of airs on account of superior powers or virtues. What Mr. COTTON says of the ideal poet expresses no doubt his own aspirations :—

It is his happy vision to convey,
His privilege and glory to impart,
Such animating solace to the heart
As shall its dire forebodings wile away.

The value of the poems is increased by the author's etchings, which form a sort of commentary on the text. It is almost as rare to meet with verses and illustrations from the same hand as poetry from an architect. The volume, therefore, claims notice for more than one reason, and Mr. COTTON has earned the support of his brother architects for proving that construction and fancy can be combined.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary meeting of the Institute of Architects was held on Monday evening, Mr. J. Macvicar Anderson, president, in the chair.

The PRESIDENT stated that all would regret to hear that Mr. Alfred Waterhouse, who had intended to be present, was prevented attending owing to the death of his brother. That gentleman had been ill for some time, and the hope that he would have been spared unfortunately had not been realised. He called on Mr. John Belcher to open the business of the meeting.

Sculpture and Sculptors' Methods in Relation to Architecture.

Mr. John Belcher said his remarks were only intended as an preface to the subject. Architecture and sculpture appealed to similar emotions. Buildings might impress the beholder, but when sculpture and colour were conjoined with architecture stronger emotions were excited. Of the magnificent independence of their art (architecture) he had not the time to speak. He would make some practical suggestions from his own experience and personal observation. The closest connection, it was obvious, existed between architecture and sculpture. That evening they met as students, for their work would gain in value and force when associated with sculpture. How was this association to come about? Their opportunities were so few, that when they did occur they scarcely were prepared to use them. Clients were little in the habit of spending money for the purpose. The initial difficulty was the cost of sculpture. One way of getting over the difficulty would be by associating the sculptor with the architect early in the work. The sculptor would then be able to give expression to the object of the building, and animate it with life and beauty. Clients would then be more likely to value the force and significance of sculpture. If left to the last, the sculpture would most likely be left out altogether. It was often thought that the finest sculpture consisted in the production of effigies, but it had a higher purpose than that of filling niches with statues. In fact, there was a wide range of work open to sculpture. If they could not have quantity let them have quality. In connection with architecture a building should by no means be considered a mere background for sculpture. Sculpture should be subordinated to the architecture. It was not even necessary that the sculpture should be of the highly-finished character of pediment sculpture. A pure and simple outline was what was wanted. High modellings should be avoided, because they created gloom. The aim should be to make the most of light and not to deepen the shadows. Largeness of scale could be obtained by sculpture. It was important that scale should be carefully treated, or, for instance, the building might become smaller to the eye than it really was. Mr. Belcher suggested

various other ways in which sculpture was of value in relation to architecture. They could only succeed by co-operation and recognising but one art.

Mr. W. S. FRITH said the subject for discussion did not, as he understood it, necessitate considering whether sculpture were requisite to architecture at all. The question, however, was sure to arise. There were no want of examples of sculpture in all styles. It was for them to understand the lessons conveyed by them, and to be able to properly benefit by the labours of their predecessors. In the abstract meaning sculpture was the reproduction of any form from nature or life that was capable of being reproduced in the solid. Sculpture, though in the abstract distinct from architecture, was otherwise intimately connected with it. Its co-operation in monumental architecture served to produce harmony at one time and contrast at another as required. In a building the functions of sculpture were to bear out contrasts of light and shade, to illustrate the meaning of the building and to add impressiveness. The sculptor was thus debarred from haphazard design. It would not be enough that the sculptor's ideas were beautiful; they must also be fitting. Sculpture must fulfil its functions within certain definitely-prescribed limits of space, position, elevation, &c., without looking constrained. It must be in accordance with optical laws to produce the right effect on the eye of the observer. The affinity of masonry to architecture and sculpture was too often forgotten. Mr. Frith outlined the treatment of sculpture in relation to architecture for purposes of giving light and shade, scale and decoration. The great difficulty was to judge of the effect while the work was in progress, the building being enclosed by hoardings, and because it was always stipulated that the scaffolding should be removed at the earliest moment, there was no chance allowed to modify the effect. He also cited several examples, and amongst them the Parthenon Frieze. By use of metopes, and by their treatment of form, the Greek sculptors made their figures look properly from below and perfectly conformed to the building without apparent effort on the part of the sculptors. It was an example of the noblest sculpture in the world.

Mr. T. STIRLING LEE expressed gratification at the desire shown to raise sculpture to its proper sphere. He looked forward to the time when such names as figure sculptors and architectural sculptors would no longer exist. What would happen when architects sent to sculptors for work? The first question would probably be that of cost. If the work were worthy of it, architects would find young sculptors ready to meet them, and it would not be a matter of cost that would stop them taking up the work. Mr. Lee mentioned incidentally the name of the late Mr. Sedding. At such a meeting, he said, they could not pass by the memory of one who had done so much to elevate sculpture as an art. The sculptor from study of the design of the building and the purpose of the building would think out his designs and work out his subject in accordance. The generality were well trained, had an artistic nature, and thus had the ability to compose. Whether the sculptor took animal life, or birds or flowers, he would divine their beautiful characteristics and meaning. Or he might select the human figure. The beauty of lines could not quite be understood without a most intimate knowledge or study of the human figure, the highest ideal of art. Without this knowledge facility of execution was wanting. There was a flow of line through the whole figure, and through every limb, forming a continuous rhythm, or balance of parts. After line the most important study was that of light and shade, or effect. It would take too long to touch on the laws of optics, but few knew what those laws were to sculptors. It was shown in the Egyptian art which was so completely mastered by the Greeks. Sculptors who had studied painting as a rule gave the most beautiful effects of light and shade. Mouldings must be very carefully taken account of in regard to light and shade. They furnished the key-note, and in the finished work the effect would be governed by the mouldings. The question of light and shade was a vital one. When the design was sketched out, it was important whenever possible to have it fixed *in situ*. The methods of executing the work and materials were next considered by Mr. Lee, and as to materials, that evening, he said, he would speak of stone. He took the human figure as the subject selected, and said that two scientific laws, those of anatomy and geometry, entered in, and he explained the different results that would ensue as preponderance was given to one or other of these two laws, and described the treatment of lines and folds in drapery.

Mr. GEORGE SIMONDS remarked that, judging from what was said there and elsewhere, there was little doubt that architects and sculptors had come to the conclusion that if we were to have a correct period of art, it must be the result of a combination of the arts. Sculpture, painting and architecture must not be like three horses put into one omnibus, all pulling in different directions, but the three should work together. Architects might build houses, sculptors put up statues, painters paint easel pictures, and send them to the Academy, the world would wag on, and they would get no further, probably deteriorate. It was fortunate that they were now agreed to drop that system. Sculptors would be found ready whenever their services were wanted to meet the awful question of price. It was an awful question. It was difficult for a man to give up much of his time to secure lower remuneration simply for love of his art. Still he believed there were many who were prepared to do so. He agreed as to sculptors not working by artists' drawings, but working into them. The figures in the charming cartoon shown by Mr. Lee were drawn as the painter would draw them, and could not be reproduced by a sculptor in stone. In drapery the work must be harmonised as a whole, and every frivolous line should be omitted. One great advantage a sculptor had in working for architecture over cabinet-work was that it had a definite place, and was seen under certain conditions, and that a certain treatment of light and shade was necessary. A sculptor should thus be able to produce work much finer than work to be exhibited in a gallery.

Mr. STATHAM said he was somewhat of an unbeliever in regard of the theories advanced in the papers read. There was a tendency to speak of the three arts as if none could stand alone. He had always maintained that architecture in harmonious design and beauty was independent of painting and sculpture, and it was putting it unfairly to say that architecture was incomplete without sculpture or painting. He thoroughly agreed that sculpture in reference to buildings required study and a somewhat different treatment, and should be conventionalised, but he would be surprised to find it thought that the sculptor should give up some of his own art. He (Mr. Statham) wished to stand up for pedestal-sculpture. In regard of the Parthenon frieze he was by no means certain they had not bowed down too blindly as to the perfection of the Greeks. He inclined to think the sculpture was not in the right place. He regarded it as a most beautiful work of art partly sacrificed, and that the Greeks regarded it rather as an architectural ornament than as sculpture.

Mr. STEPHEN WEBB expressed the interest with which he had heard the papers.

Mr. WM. WOODWARD congratulated the Institute on having a member who could teach Greeks where to place sculpture. It was still more satisfactory to find that he had not overlooked the Greeks and their art. Architects might help sculptors in introducing sculpture in the houses of the middle classes, as well as in those of the rich. In one house he had provided niches, and had prevailed on his client to have sculpture placed in them. Well-to-do middle-class clients might be induced to go in for sculpture, instead of wasting their money on paintings.

Mr. PINKER said he could say no more than that he endorsed the views expressed in the able papers read.

Mr. WM. YOUNG said that 10,000*l.* had been allowed for sculpture for the Glasgow Municipal Buildings. There were over one hundred figures, and 40,000*l.* would not represent the money-value of the work. He then described the subjects illustrated by the sculpture.

Mr. HARRY BATES also excused himself from addressing the meeting.

Mr. CONRAD DRESSLER said there was much that was wrong about architecture and sculpture, and which ought to be put right. Some means of combining architecture and sculpture had not been spoken of. The education neither of the one nor the other was satisfactory. Old methods—that of apprenticeship—especially among sculptors, had died out. The apprentice system, which had borne great fruit and encouraged tradition, enabled students and pupils to go forward from where their masters stopped. Would it not be best to take young men into their studios, show them how to work, employ them on their work, and then in time, when they had acquired their knowledge both in theory and practice, let them start on their own account? That he believed was better than sending young men to South Kensington or the Ecole des Beaux-Arts, where they learned only the theory.

Mr. BERESFORD PITE proposed a vote of thanks to the readers of the papers. Perhaps, he said, he might take the opportunity to say that it was a matter of considerable regret to find that several sculptors of the greatest eminence had announced that it was their intention never to read papers or take part in discussions. Had they been present they might, he thought, have altered their opinion. He referred to the Wellington monument in St. Paul's Cathedral, the work of an accomplished sculptor and an accomplished architect combined, Alfred Stevens; a work that they could not hope to see excelled in this century. Would they find another Alfred Stevens in the ranks of architects or of sculptors? If sculptors would take up architecture in their sculpture, there would be a chance of seeing another Stevens or Michael Angelo.

Mr. R. PHENÉ SPIERS, F.S.A., alluded to the contrast in the decoration of public buildings in Paris, Berlin and the chief cities abroad and in this country. Abroad it was recognised that art must be paid for, and must be subsidised, if art of high character was to be had. That was not all. In France students

of the three arts studied together and came in contact with each other. They influenced one another. Architecture was not considered to stand alone, but to have the assistance of the sister arts. Thirdly, figure drawing was a great necessity for architects. Mr. Burges never lost an opportunity of advocating the practice. Knowledge of the subtleties of figure-drawing enabled one to draw all other forms. The French students in their examinations had to show they possessed some knowledge of figure-drawing. As a matter of fact, in their architectural designs they never hesitated to indicate the character of figure and sculpture work they would wish to have. The book they studied chiefly was Flaxman's; it was in every atelier. It was not done here. Unless done when they were students they would never do it at all. He concluded by seconding the vote.

Mr. MACLACHLAN said, on his visit to Germany, one lesson he learned was that we were very backward here as regarded combining sculpture with architecture. The humidity of the air here, redolent with soot, was against clients spending money on what would be totally destroyed in a few years.

Mr. POMEROY said that apprenticeship still existed.

Mr. WM. WHITE, F.S.A., referred to the superstitious fears that accompanied the Reformation in regard of sculpture and painting, which would account for some lack of combination between the arts.

The PRESIDENT put the vote to the meeting, and it was carried by acclamation.

The three gentlemen briefly acknowledged the compliment, and the meeting adjourned.

THE FUNCTIONS OF SUPERINTENDENTS OF WORKS.

ON Monday judgment was given in a case which related to the construction of flour mills and granaries at Rio de Janeiro, but which raised the important question as to the functions of an architect, surveyor or engineer appointed under a contract to see that it is duly carried out, and the liability of either of the parties for any errors of his, and especially for errors of a "local" or "resident" engineer.

According to the *Times* report the contract, made in December 1886, provided that "the work should be done" to the reasonable satisfaction of the consulting engineer of the company (called the chief engineer), and to be duly certified by him when completed, and according to plans, &c., approved by him or, with his consent, the company's resident engineer. The works were to be completed before November 30, 1888, and if delayed by the company, then the contractor to be entitled to compensation, and if caused by default of the contractor, then he to pay 250*l.* for every month after the expiration of the time until the works should be complete, so as to be fit to be opened for use. The contractor was to provide for the company 10,000*l.* in cash for its administration expenses during construction, and was to employ an agent or engineer on his behalf at the works in Brazil, who was to make statements to the resident engineer of the quantity of work executed, &c. The chief engineer was on the completion of the works to give his final certificate. A resident engineer was during the continuance of the contract to be employed at the works, to be subordinate to the chief engineer, and it was to be his duty to measure up the works duly executed, and without delay to communicate to the chief engineer, to enable him to give certificates; and should the resident engineer fail to do so, the chief engineer might give a certificate upon the statement of the contractor if satisfied therewith. Then, by clause 26, "If at any time the works were not, in the judgment of the chief engineer or resident engineer, duly executed, that should be intimated to the contractor by the resident engineer, and if for a month the contractor shall neglect to alter and duly execute the works, &c., the chief engineer or his delegate may take the works out of the hands of the contractor and complete the same," &c. By clause 30, "Every difference or dispute between the company and the contractor as to the meaning of the contract (or specification), or in any way arising out of it or relating thereto, from time to time as it arises, including any act or decision of the chief engineer, shall be referred to arbitration in London." Then there was a detailed specification of the works to be executed, which stated that the term "'resident engineer' shall signify any person appointed by the engineer (*i.e.* the chief engineer) to superintend the execution of the works in Brazil." Much importance was attached to clause 19 of the specification:—"If at any time during the progress of the work the engineer or resident engineer shall disapprove of the materials employed, the contractor shall be bound forthwith to remove such objectionable materials from the works and to substitute for them others of an approved quality, and in case any portion of the work executed shall, in the judgment of the engineer or resident engineer, be considered to be defective or not in accordance with the terms of the contract, such portion shall forthwith be removed and the work re-executed in an approved manner." And by clause 20, "The whole of the work to be carried out to the entire satisfaction of the engineer, and any additional work or machinery that may be thought necessary by the engineer not mentioned in this specification, but thought necessary for the efficiency of the milling plant, shall be done," &c. Such was the contract originally entered into, and under which the works were to be completed on November 30, 1888. It was found, however, necessary—the mills being near the sea—to have a small jetty for the purpose of loading and unloading, and this, of course, somewhat increased the work to be done, and in the making of the sea wall of concrete a soil of mud was used by the contractor, of which the resident engineer disapproved, and this led to a reference to the chief engineer, who approved of the mud, and this caused a delay of some months. Nevertheless, the mills were so far completed as to be ready for work in October 1888, and under a provision in the contract the contractor became entitled to the profits of the working of the mills for October and November, and these profits came, it was stated, to about 1,600*l.*, and on November 30, 1888, the mills were handed over to the company, who had ever since been in possession and working the mills, though not, it was said, for some time at a profit, owing to the non-completion of the jetty, &c. These additional works, however, were completed in February 1889, and the works, in the opinion of the arbitrator, should and might, but for the delay which had intervened, have been finally completed, according to the contract, in January 1889, but were not, as he found, in fact so completed on June 30, 1889. In the meantime the revolution in the Argentine Republic had taken place, and the retention fund having been invested at the contractor's request in Argentine securities, the latter had become greatly depreciated, and in other respects the contractor complained that he had been prejudiced by the delay which had taken place. In respect of these matters he made claims to the amount of many thousands of pounds, while, on the other hand, the company claimed penalties, &c., to the amount of 2,000*l.* These claims were, under the contract, referred to arbitration in London, and the arbitrator's sittings took up twenty-eight days, and the arbitrator made an elaborate special award setting forth the facts so as to raise the question of law, the broad question being whether the company was responsible to the contractor for the consequences of the delay caused by the resident engineer. The arbitrator found that there had been seven months' delay, two months of it owing to the contractor's default, the other five months to the "wrongful and unreasonable interference of the resident engineer," and for this he awarded to the contractor 6,600*l.*, and besides an award for the depreciation of the securities above mentioned, he awarded also to the contractor the sum of 1,600*l.* for the profits of the working of the mills in October and November, 1888, and, in short, his award was substantially in favour of the contractor. The company objected to it on various grounds, the main one being that the engineer was in the position of an arbiter appointed by and acting for both parties, and that, as no action could be maintained by either of the parties against him, so, *à fortiori*, neither of them could maintain an action against the other in respect of any error of the engineer, it being admitted that he had acted honestly.

The Court had taken time to consider their judgment, which at last was delivered in favour of the company, upholding the award of the arbitrator so far as in their favour and overruling it so far as it was against them.

Mr. Justice Mathew said:—The contract was in most respects in the ordinary terms, but in one respect it differed from those familiar to us in similar cases, for it provided that the certificate of the chief engineer should not be conclusive, but that if any disputes should arise they should be submitted to an arbitrator. What happened was this. The plans were approved of and the works commenced. In the course of the works the resident engineer objected, in the exercise of the powers confided to him by the contract, to certain materials proposed to be used and certain structures to be erected. On these objections being made by him the works were suspended by the contractor, and the difficulties which had been raised by him were referred to the chief engineer in this country, who overruled the decision of the resident engineer, and after an interval of five weeks, during which the works were suspended, they were resumed. In consequence of this delay the contractor made a claim against the company, and certain disputes and differences arose between the parties. Before the final certificate of the chief engineer was given in the terms of the contract the works had been completed and handed over to the company, and it was arranged that all disputes should be referred to arbitration, and an award was made upon which the present questions have arisen. Now, the chief claim made by the contractor was in respect of the delay occasioned by the interference of the resident engineer, and it was argued before the arbitrator, and subsequently before us, that the company was responsible for the interference of the resident engineer. It

was said he was the agent of the company, and had interfered as their agent, and that so his acts were the acts of the company, and that as it was an implied condition of the contract that the contractor should not be prevented from carrying out the works, the breach of that implied contract entitled him to damages. On the other hand, it was argued for the company that the resident engineer was not in that sense, if in any, the agent of the company, but that in making the objections he acted in good faith, though he was mistaken, and had raised the difficulties which had arisen in the discharge of what he considered to be his duty as resident engineer, and that the company were no more responsible for mistakes made by him than they would have been for mistakes made by the chief engineer. Now, it follows from this that the question discussed before the arbitrator and before us as to the functions of the resident engineer must depend upon the terms of the contract as to that officer. The resident engineer was to be "subordinate" to the chief engineer, and "the engineer" was to mean the chief engineer, and the resident engineer the person appointed by the chief engineer, so that the resident engineer was to be appointed with the sanction of the chief engineer, and became the resident engineer within the contract. These being the provisions of the contract as to the resident engineer, what is the law properly applicable to such a case? Now it was not seriously controverted that if the mistakes in question had been made by the chief engineer the company could not have been held responsible for them. The learned counsel for the company, upon that question, referred to a series of authorities on that subject. In Clarke *v.* Watson it was held that where by the contract the certificate of an architect or engineer is a condition of the employer's liability, the want of that certificate prevented the contractor from recovering, even though it should appear that the refusal of it was not reasonable. So long as the employer has not interfered and the engineer has acted independently, in such a case it is final and binding upon the parties; it is a quasi-judicial act in the discharge of a duty and involves no liability on either party. In Roberts *v.* The Bury Commissioners the Court pointed out very clearly in what cases one of the parties might be responsible for any interference on the part of the engineer or other analogous officer whose conduct is called in question. There is an implied undertaking as to each of the parties that they shall not interfere with him in the discharge of his duties, and so long as that is adhered to on their part neither party is responsible for the mistakes he may have made. Again, in Stephenson *v.* Watson it was laid down that so long as the architect or engineer has discharged his duty without any suggestion of bad faith he cannot be made responsible for errors of judgment by him in the exercise of his functions. Such being undoubtedly the law as to the chief engineer, does it apply to the case of the resident engineer? In my judgment it does. The resident engineer under this contract is in the position of the chief engineer, who is in this country, and can only act by the resident engineer in the actual supervision of the works. It is expressly provided that the resident engineer is to be "subordinate" to the chief engineer, and, therefore, it appears to us that the same principle of law applies to him as to the chief engineer. It was, indeed, contended on the part of the contractor that the resident engineer was really not discharging any such duties as were imposed upon the chief engineer by the contract, and that he was, in fact, agent of the company, and that when he interfered he was not acting as resident engineer, but as agent of the company, and that, therefore, the company were responsible. But there is not a shadow of evidence that the company in any way interfered with the resident engineer, who acted on his own responsibility and on his own judgment as to what was right. No doubt the company were informed of what was done by the chief engineer, but there was no evidence of any ratification by them of any acts professedly done by him on the part of the company such as would make them responsible for his acts. The learned counsel for the contractor relied upon a clause in the contract under which materials were to be consigned to the resident engineer as agent of the company, from which he argued that he was their agent for all purposes, but that did not follow, and the clause is, on the contrary, strictly limited in its scope. It appears to me therefore, on the whole, that neither of the parties can be responsible for mistakes of the resident engineer, and that on the first and principal head of claim on which the arbitrator has awarded 6,600*l.* to the contractor, he has no claim against the company, and therefore that the award must be altered in that respect. The next question raised was as to the contractor's claim in respect of differences in the value of the securities in which the "retention money" was invested. He was to select the securities, and he selected Argentine securities. The works were handed over, as the arbitrator found, in June 1889 completed according to the contract, but the chief engineer had not given his final certificate. At the date of the award (March last), the arbitrator found that the contractor was entitled in June 1889 to have the final certificate of the engineer, but as the securities still remained in the hands of the company, and the value of the securities had fallen seriously in the meantime, the claim of the contractor was that the company should be held responsible for the difference in value. The question is, whether under the terms of the contract the claim is maintainable. Now, the money was to be invested "in such securities as agreed upon between them," at the risk of the contractor, and shall be transferred at the completion of the contract, &c. Now, the final certificate was to be given by the chief engineer, and as it turned out, he was wrong in withholding it. But upon the authorities cited it appears that the company was not responsible for mistakes of the engineer's. It follows that the loss arising from the fall in the value of the securities cannot be cast upon the company. These are the chief questions arising on the claims of the contractor against the company. Then as to claims made by the company against the contractor under the clauses in the contract as to delay by him. There is a clause in the contract that if from any cause (other than the default of the company) the works should not be completed on November 30, 1888, the contractor shall pay 400*l.* a month until the works should be completed. It seems to us that the words of the contract are too clear to be got over, and that therefore the 400*l.* a month for delay not caused by the company must be paid by the contractor. Then, as to the 6 per cent. interest to be paid by the contractor in certain events, which have happened, until the completion of the works, we consider that this claim also is supported and that the interest is recoverable. It was contended by Mr. Bray (who argued the case very ably for the contractor) that by a supplemental contract the company were to be at liberty to take possession of the works, paying to the contractor the profits up to November 30, 1888, or up to the date when the works were completed, &c. But the clause also provides that it shall not affect the provisions of the principal deed as to the completion of the works and the payment of interest until completion. That appears to us clear and decisive of the question, and this disposes of all the questions raised in the case. We come, therefore, to the conclusion that our judgment must be in favour of the company against the contractor. Lord Coleridge agrees with me in the conclusion to which I have come, though for the terms of the judgment I alone am responsible.

The award was sent back to the arbitrator to be altered in accordance with this judgment.

THE CARRAND COLLECTION AT FLORENCE.

RICH as are the collections at Florence, they have lately become richer still, writes a correspondent of the *Times*, through the important bequest of the late M. Louis Carrand, a Frenchman who had lived for many years at Florence and Pisa. Both he and his father were men of great taste and knowledge, and were enthusiastic collectors of the works of Mediæval and Renaissance art at a time when those things were still to be found, and were attainable by persons of moderate fortune.

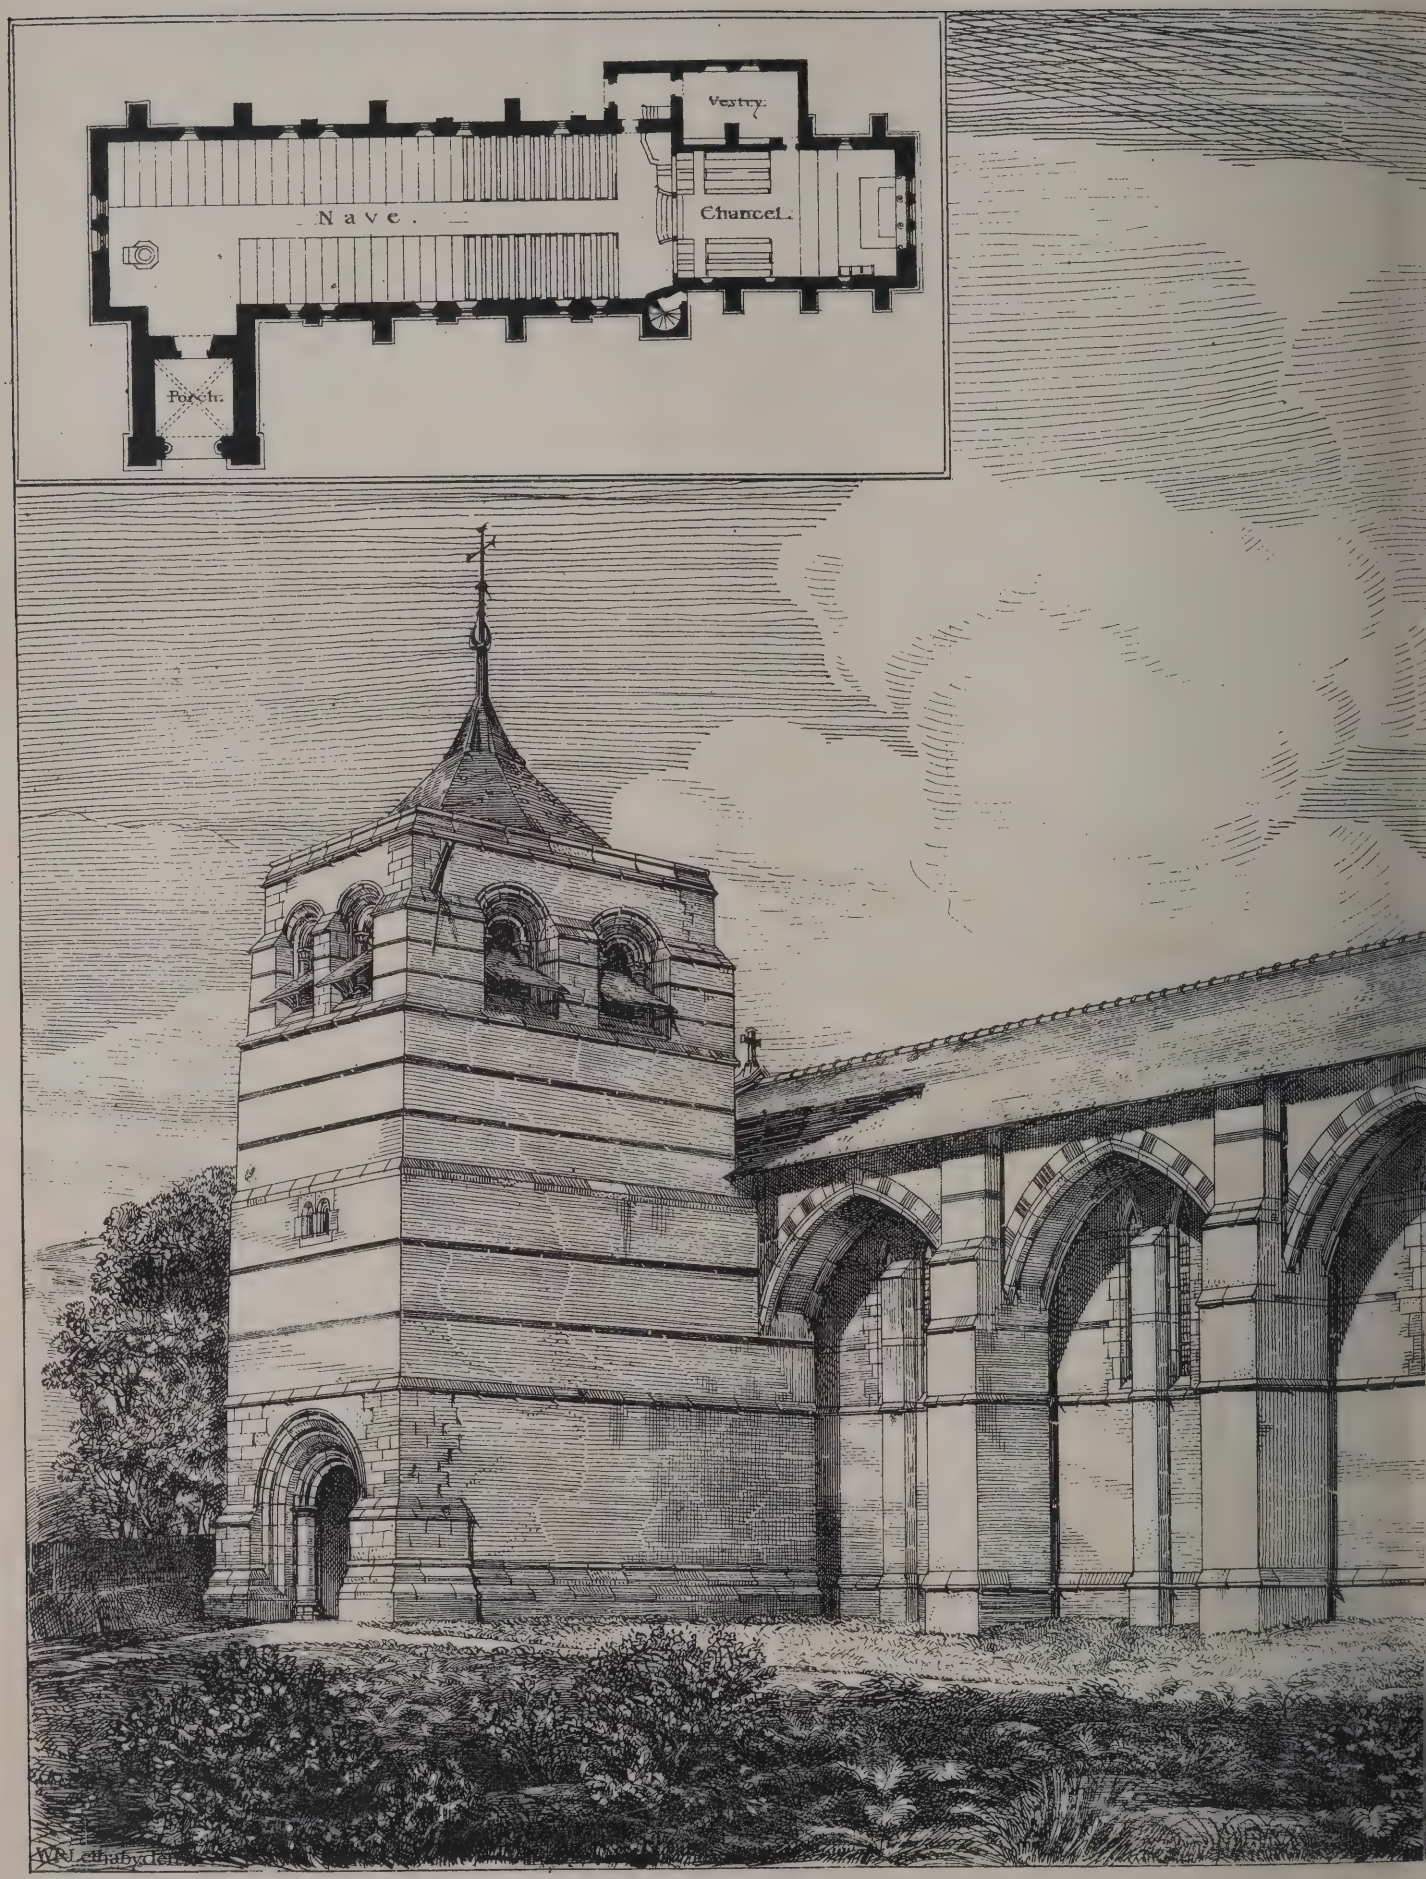
M. Carrand *père* was at one time archivist of the town of Lyons, and while France was quieting down after the Napoleonic wars, he was one of the first and best of the students and connoisseurs who made a business of gathering together the treasures that the Revolution had dispersed. He it was who formed the famous Soltykoff and Basilewsky collections, to name only two among several of the wealthy men whom he helped with his advice; while at the same time he kept many choice specimens for himself, especially in the departments of ivory and goldsmiths' work. On his death he left both his collections and his tastes to his son, in whose hands the former assumed large dimensions. Unfortunately for France, M. Louis Carrand happened to be in Paris during the last days of the Commune, and the burning of the Tuileries, and the attempt, which was so nearly successful, to burn the Louvre, persuaded him that no French city was a safe home for the treasures of art. So he migrated to Italy, and when the Government organised the new national museum in the Bargello, he determined to add his collection to the stores of similar works that were there brought together. He died about three years ago, and now, thanks to the energy and skill of Dr. Umberto Rossi, the director of the museum, the many hundreds of objects have been arranged, classified and labelled in four rooms of the old palace. They make a very interesting and important show, and, as one goes through the cases one by one, the valuation of 3,000,000 frs. which has been put upon the collection comes to appear by no means excessive.

It is difficult to choose among the many hundreds of objects which the cases contain, but if we mention a few almost at random they will be enough to show how greatly the Bargello collection has been enriched by the bequest. One of the strongest departments is that of the Mediæval ivories, among which is one of the eighth century with an Anglo-Saxon inscription—a fragment, of which the remainder is in the

British Museum. Another extremely rare piece is a chess-board surrounded with elaborate carvings, a remarkable example of the rude but interesting Burgundian art of the early part of the fifteenth century. But the greatest treasure among the ivories is the celebrated fan, or flabellum, of the ninth century, which was preserved for many hundreds of years in the Abbaye de Journus, where it was described by Montfaucon in his great work. Stolen at the Revolution, this wonderful relic of Mediæval art had the good fortune to escape destruction, and the elder M. Carrand purchased it. For several years the Musée de Cluny made attempts to buy it from him, but nothing came of them, and it has now found a permanent resting place in the Museum of Florence. Of goldsmiths' work there is a large quantity, and though it does not bear comparison with such a collection as that of the late M. Spitzer, it contains much that is of special interest, such as the pierced and enamelled lanterns made in Venice in the sixteenth century, and the French and Italian jewels of the same date. A French brooch, with the head of Diana in enamel—which may possibly have been made for Diane de Poitiers—is hardly inferior to Greek art of a similar kind. The Limoges enamels are historically very interesting, many of the examples going back to the eleventh and twelfth centuries, and a triptych of this same material is important as being one of the two known pieces that bear the signature of Nardon Pénicaud (1470–1540). The bronze medals and plaquettes are all very good of their kind, though they are not numerous; one very rare medal, that of Alessandro di Gino Vecchietti, could not be surpassed for beauty of treatment and condition, or for the wonderful fineness with which the hair is rendered. The collection also contains one of the two or three known repetitions of the celebrated Martelli plaque by Donatello, the original of which is in the South Kensington Museum. Lastly, we may mention a very curious *acquamanile*, or grotesque water-jug in the form of a horse and his rider. The design is not uncommon, but this specimen, which is of the thirteenth century, represents a young king or prince, and the trappings of the horse bear the royal arms of England. Very possibly the figure is intended to represent one of the sons of Henry II.

It is not only by the Carrand bequest that the Bargello collection has been increased of late. We are in the habit of saying that everything in Italy is known; but even now discoveries continue to be made, and Dr. Rossi is one of the happy persons who make them. He has been hunting about in the storerooms and forgotten cupboards of the Uffizi, with the result that he has found medals and plaques enough to fill a large case; and doubtless when these are arranged, as they will be in a few weeks, our knowledge of this branch of Renaissance art will be perceptibly increased. A still more curious discovery was that of a large oval portrait medallion in Limoges enamel, very finely executed by Leonard Limousin, whose signature it bears. Dr. Rossi has not yet identified the subject, but it appears to be some prince or great noble. Such are the "finds" that occasionally reward the searcher even in these days, when everything is supposed to have been long since classified and catalogued.

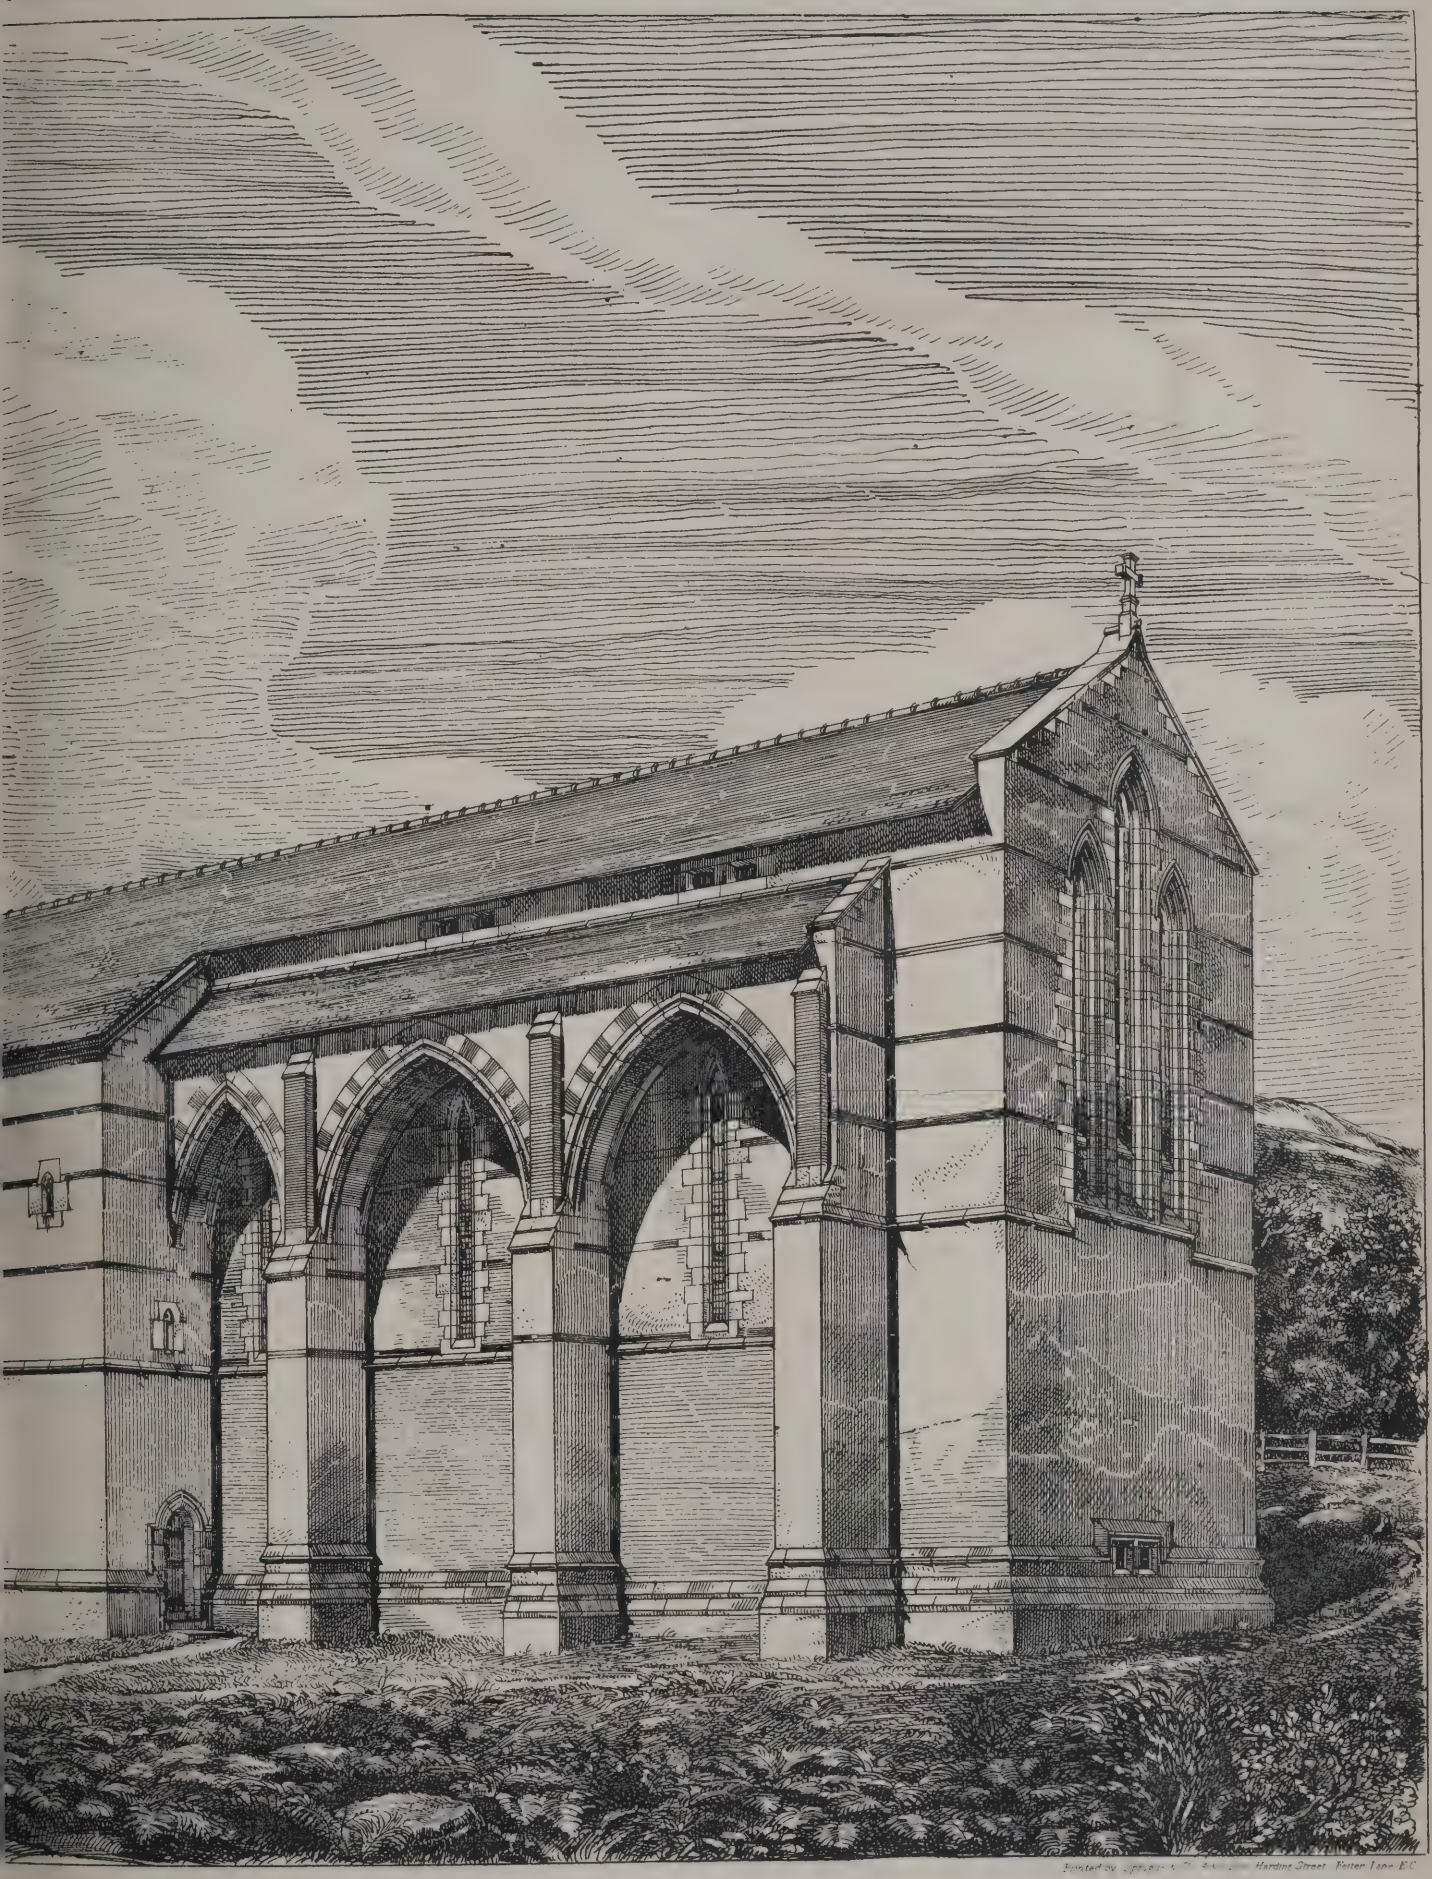
NOTTINGHAM CASTLE MUSEUM.



A MEETING of the Nottingham Town Council is to be held on Monday, when a report is to be presented by the Castle Museum Committee as to the completion of the restoration of the old kitchens at the Castle. They state that they have had under their consideration the desirability of completing the large gallery, and the workshops and storerooms situate thereunder, now occupying the site of the old kitchens at the Castle. The Council are aware that in pursuance of the powers conferred on their committee the work of restoration has been carried out to the extent of finishing the external work of the above gallery, workshops and storerooms, and the forming of a new and independent approach thereto. The committee are unanimously of opinion that the time has now arrived when it is desirable and proper that this gallery, workshops and storerooms should be made available for use as part of the Castle Museum. The gallery is 114 feet 7 inches long and 26 feet 3 inches wide, and in its present form is of no service. The committee propose that the large gallery should be floored, ceiled and the walls boarded. They also recommend that the dangerous arches at the west end of the courtyard should be taken down and rebuilt, being of opinion that this is necessary for the public safety. The whole of these works will, it is estimated, cost the sum of 1,100*l*. The committee are unanimously of opinion that the heating of the gallery and workshops and the lighting thereof by electricity should be carried out in such manner as they may hereafter determine. The system employed will be such as to fit in with any action which the Town Council may take with respect to electric lighting. With respect to heating the committee have resolved that the present boiler, which is in a very inconvenient spot, should be removed, and with additional boiler accommodation should be refixed under the arches on the west side of the courtyard. The costs of lighting and heating are estimated not to exceed 1,000*l*. There will be other expenses attending the carrying out of the works, which the committee do not believe will exceed 200*l*., making a total of 2,300*l*. When the above works have been carried out the restoration of the Castle will be complete. The Council are aware that at the present time pictures and works of art have to be stored at repositories in the town at great cost and risk, and at much disadvantage. The committee recommend that the balance of the money for the race fund, amounting to 950*l*. (which the Council on March 2 last ordered to be placed at the disposal of the Corporation for public purposes), should be used in part payment of the above outlay, and that the rest should be raised by loan, or as a direct charge upon the general district rate for the next year, as the Finance Committee may determine.

A COUNTY MUSEUM FOR BUCKS.

ON Saturday a meeting of the provisional committee was held at the County Hall, Aylesbury, under the presidency of Mr. H. Cazenove. Professor Flower, writing from the British Museum, pointed out that a good county museum, well arranged, neat and attractive, might be the means of conveying instruction and giving interest and pleasure to thousands, and that money, time, knowledge and sympathetic care must be expended upon it. Professor Adfred Newton, of Magdalene College, Cambridge, said that the proposal to establish a museum for Buckinghamshire had his best wishes. He advocated the founding of a maintenance fund, which should be vested in trustees. Professor Green, of the University Museum, Oxford, contended that in the proposed museum care should be taken for the proper selection of objects, the primary end being to illustrate the district in which it existed. Sir Harry Verney, in proposing that it was desirable to establish a county museum for Bucks, and that an executive committee should be appointed to take the necessary measures, said that the county had from time to time been the scene of important occurrences in history, and many relics might have been preserved if there had been a central place to store them. He was not in favour of a museum merely for sightseers, but wished it to wield an educational influence, and be the centre of lectures and meetings from which information generally might be obtainable. Mr. Myres, the secretary, pointed out that under the Museums Donations Act a ½*d*. rate might be raised by urban authorities to establish museums on the condition that they were open free three days a week. Professor Herschel advised that technical classes carried on by the county councils should be separated from museums. Sir Harry Verney reminded the meeting of his intention to hand over a collection of curiosities in his possession to the county museum when started. Mr. Gibbs hoped that the property of the Bucks Archæological Society would be handed over to the new county museum. Dr. Walford also intimated his intention of making a present of Anglo-Saxon relics to the proposed institution. The resolution having been unanimously carried, Mr. F. W. Verney proposed that the following be placed on the provisional committee to canvas the county, if necessary, for subscriptions and be responsible for any treasures committed to their care:—Sir H. Verney, Lord Carrington, Mr. W. F. D. Smith, M.P., Professor Flower, Professor Herschel, and Messrs. T. Horwood, Hart, H. Cazenove, A. H. Cocks and Myres. A discussion ensued as to the cost of the proposed museum. Mr. Myres expressed his opinion that at least they would require to raise 3,000*l*. The meeting closed with a cordial vote of thanks to Sir Harry Verney for promoting the movement.



EMPLOYERS' LIABILITY AND SUB-CONTRACTS.

A CLAIM came before Mr. Commissioner Kerr and a jury in the City of London Court under the Employers' Liability Act, which was made by a labourer to recover 234*l*. as damages for serious injuries he had sustained through the negligence of a foreman in the service of the defendants, Messrs. John Mowlem & Co., contractors. The plaintiff said that he was employed by the defendants in bricklaying work on the premises of the Great Eastern Railway Company at Bishopsgate, where extensive alterations were being made in enlarging Liverpool Street Station. A quantity of bricks fell upon him, and he was very seriously hurt, having suffered injuries which might be permanent. The defendants, while regretting the accident, set up a sub-contract between themselves and a person who, as they alleged, employed the plaintiff. This, it was urged, exempted them from liability. The plaintiff said he only regarded the sub-contractor as a foreman. The jury found for the plaintiff for 175*l*.

NO. 441.—NEW CHURCH, PORT ELIZABETH, SOUTH AFRICA. [R. NORMAN SHAW, R.A.]

HOUSE AT EASTBOURNE.

THIS house, which has just been completed for Dr. ARTHUR OAKES, is situated in the upper portion of Carlisle Road, on the slope of the hill known as Paradise, overlooking the golf links. From its elevated position it commands extensive views of the sea, the coast, and the inland country. The site slopes considerably towards the south, so that the ground-floor level of the house is some 15 feet above the level of the road, and about 5 or 6 feet above the ground on the entrance or south front, but only a few inches above the level of the ground on the north side. The garden extends northwards to about 250 feet from the house, and a portion of it has been levelled to form a tennis-lawn, 115 feet by 105 feet. Beyond this are the kitchen garden and glass-houses, vineries, &c. The stable buildings are near the north-east angle of the house, facing east, and screening the stable-yard from the house and garden. The walls of the house are of brick, built hollow up to the first-floor level, faced with local red bricks, with moulded brick string-courses, chimney cornices and caps, &c., and stone-dressings to the principal windows and doors on the ground-floor. Above the first-floor level the walls are carried up 9 inches thick, and covered with ornamental tile-hanging, with half-timbered work, overhanging gables, &c. The roofs are covered with Broseley tiles. The interior woodwork of the hall and staircase is of pitch-pine stained green, and includes high dado panelling and a hooded chimneypiece. This and the American walnut mantel in the dining-room are from the architect's designs. Most of the other mantelpieces are supplied by Messrs. C. HINDLEY & Co. The small plans explain the arrangement of the house on the ground and first floors. The second floor contains a billiard-room, play-room, four additional bedrooms, box-room, bath-room and housemaid's closet. There is no basement except a heating-chamber under the hall, approached from the outside of the house. In addition to the fireplaces, the house is heated by hot air, by an apparatus supplied by Messrs. CONSTANTINE, of Manchester, fresh air being brought in from outside, heated and carried through separate flues to each room, the inlets being close to the floor level. The architect is Mr. LOUIS AMBLER, A.R.I.B.A., of London and Brentford, and Mr. B. STEVENS, of Eastbourne, is the builder.

DESIGN FOR A PUBLIC LIBRARY.

THIS illustration is a reproduction of a fine drawing by Mr. A. C. BREDEN, of Moorgate Street, which was exhibited this year at the Royal Academy.

THE ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting of the Association was held on Friday evening, Mr. F. T. Baggallay, president, in the chair.

The following gentlemen were elected members :—Messrs. W. Furneaux, L. C. Daviniere, J. Cartledge, G. Newport, P. Dixon, W. Mackinnon and D. G. Salier.

It was announced that Mr. Oliver had offered a prive of five guineas in connection with the Sketching and Measuring Class.

The late J. D. Sedding and his Work.

Mr. H. WILSON said his paper was intended to raise a discussion, and not to be a serious contribution to the history of the late Mr. Sedding. Art was at the present day universally worshipped. The word was in everyone's mouth. Mr. Sedding was born in 1838 at the time when the revolt against pre-Raphaelitism began, and at the time when the Gothic revival began. In his early years he fell under the influence of Ruskin. He studied his works on architecture, and copied his drawings so faithfully that Mr. Kegan Paul said he had great difficulty in distinguishing which was the original. In 1858 he entered the office of the late G. E. Street, but as they did not agree long together he left Mr. Street to join Edmund Sedding, his brother, in Cornwall. He studied Cornish church architecture most assiduously, and was untiring in his wanderings over the county, note-book in hand. These studies permanently influenced his work as a restorer of churches, and enabled him to produce the local colouring and perfect harmony that was seen to exist between his work and its surroundings. He was a great observer and drew lessons from everything, from old work and from nature—birds, animals, flowers, &c. If he had recourse to any examples of this kind, if he brought out a drawing or illustration to prompt him, it served only as a suggestion to bring out his own originality. The two brothers worked together till the death of Edmund Sedding. John Sedding then took up his brother's practice as far as concerned completing the works in hand. After that he left Cornwall, and went to Bristol, and getting no work, he spent his time in making designs for embroidery. In 1872 he married, and his wife had no small share in bringing about his future success. In 1875 he came to London, and settled in Charlotte Street, Bedford Square. Work, though at last it came, was more difficult than ever to get. Alluding to the pleasant home in Charlotte Street, Mr. Wilson said Mr. Sedding exercised great influence over young men. He continued to work hard at textile designs, and during this time of trial gained his knowledge of art. He made personal friends of his assistants and pupils, and Mrs. Sedding worked in the office at her embroidery, and would also make tea for them there. Mr. Sedding had one great gift, that of seeing and of being able to impart sight to others. Mr. Sedding's buildings, compared with the piles of brick and stone of other men that cumbered the earth, were as jewels beside dunghills. His Holy Trinity Church was praised by Mr. Burne-Jones, Mr. William Morris and all true artists. He was the only man of his day who had an idea of the nobility of his art. The Architectural Association was erecting a tremendous bar to art by its new and portentous educational scheme which would flood London with *dilettanti* proprietors of plan-factories. The whole tended to academicism, and it would end in perpetuating the curse of art, viz. the professional architect. Academicism and institutism were the two banes of art. The hope of architecture lay in the extinction of professional architects and the doing away with assistants and the tyranny of the office-desk. Mr. Wilson condemned sweepingly all the existing order of things and announced the workshop as the birthplace of art. The office must be got rid of. The workshop must be substituted. Design was to be committed to craftsmen if it were to be artistic. The workshop was not to be a studio such as the Association was inaugurating. They must work with plasterers, at the blacksmith's forge, and in the mason's shed, and constructional problems would be solved not at a distance, but on the spot. Precious hours of life should no longer be wasted in useless book-learning. Practical knowledge must be gained from actual work. The present race of decorators, carvers, &c., would be abolished, and the so-called practical men of business would be left to attend to the drains and sanitation they loved so well. Mr. Wilson held up Mr. Burne-Jones and Mr. William Morris as his examples of practical knowledge gained by work, and further set down Mr. Sedding as holding the views he expressed. Mr. Sedding, he said, was an artist. He used his workmen's fingers as his own. He hated new workmen. Mr. Wilson made also some remarks on Mr. Norman Shaw and Philip Webb. If matters were gone about properly we should eventually become a nation of artists and craftsmen.

Mr. LEONARD STOKES said, though he first made Mr. Sedding's acquaintance in a commonplace way, he had been filled by him with enthusiasm, and they ended in being fast friends. If Mr. Sedding differed from you, he showed it and laid himself out scrupulously to give his reasons. After alluding to Mr. Wilson's statements as to Mr. Sedding and the Institute of Architects, Mr. Stokes said he did not think Mr. Wilson had intended incivilities to the Association. There were, no doubt, two sides to every question, and the Association must not be blamed for recognising the existing order of things, even if wrong. If Mr. Wilson would change that order of things, they also would change.

Mr. WILSON interrupted.

Mr. STOKES said he would return to Mr. Sedding. Several churches had been built in Bournemouth. He believed that each R.A. had one. He did not mean to insinuate that they were bad, but he came to Mr. Sedding's church with a sense of relief. Church, cloisters and parsonage were each and all perfect. He proposed a vote of thanks to Mr. Wilson.

Mr. E. W. MOUNTFORD said Mr. Wilson was rather wrong in supposing his paper would stir up discussion. The paper had tended to stop discussion, rather than otherwise. He had had the great pleasure of knowing Mr. Sedding, who was always at his best when joining in the excursions of the Association. Everything beautiful excited unbounded admiration in Mr. Sedding. He seemed to have revelled in designs for metal.

work and embroidery. Mr. Sedding's book on "Garden Craft" should be read by every architect.

Mr. C. H. BRODIE said Mr. Wilson's criticism of the Architectural Association and its work would be less scathing when he mentioned that Mr. Sedding had often read papers to them, and joined in the excursions. Mr. Wilson should rather have been thankful to the Association. He (Mr. Brodie) did not like to hear persons say that things should not be done because they could not be done entirely as those people wanted them done. Some men were like the Pharisees of old. They were the gods to be worshipped, regardless of the needs of humanity around them.

Mr. R. D. BLOW thought that Mr. Wilson's intention was not to run down the Association but to help it on. They should take Mr. Wilson to themselves, as he had imbibed so much of the spirit of Mr. Sedding. The Association, Institute of Architects, and Royal Academy—he did not mean to run them down—must do harm.

Mr. OWEN FLEMING said they would willingly take Mr. Wilson, if he could be kept from running off on a track of his own. It was a great pity that a few men, whose work they respected and admired, were going away from them, selfishly it might be said, just at the time when, if good was to be done, it could be done.

The PRESIDENT said Mr. Wilson was mistaken in supposing that he would raise a discussion. Mr. Wilson was therefore probably wrong in his other views. He regretted Mr. Wilson's little outbreak against the educational scheme. It was in the tone of much that had been said before. It could do no good, but it would embitter the breach that was springing up. The vote was then put and carried by acclamation.

Mr. WILSON said he was sorry that what he had said about the scheme was misunderstood. He wanted to help the members. His remarks were only intended as paradoxes. He had used strong language to make them think. He should be happy if he had succeeded, and had done anything to help on a revival of real art.

SOMERSET HOUSE.

A LETTER from Mr. Waterhouse appears in the *Times* in which he says:—Into the controversy, re-awakened in your columns, as to the twofold nature of the architect I do not propose again to enter, as you were good enough to allow me space last year for expressing myself on this subject. There is no doubt, however, that all real architects were, and are, artists. There was one who at the end of last century gave to London one of her noblest adornments in a building all must admire, and which within the last few years has had its beauties greatly enhanced by the formation of the Thames Embankment at its base; so that, I suppose, there is nowhere in London a spot more attractive than the river-front of Sir William Chambers's Somerset House. It is obvious that its immediate surroundings, the river itself, the grand sweep of Waterloo Bridge spanning it and the broad tree-skirted roadway add to the charm of the view. But it is the noble mass of Somerset House itself which gives the keynote to the picture at this particular place. The power of this building to so impress us arises in large measure from its absolute symmetry and balance of parts, from its leading lines being horizontal lines following the river at its base, and from the avoidance of any feature in its sky-line to interfere with the sense of horizontality and repose. It is therefore with more than sincere regret—it is with indignation—that the admirers of this most beautiful creation of that true artist-architect, Chambers, see his masterpiece invaded by a tall erection of stock-brick rising, in part at any rate, out of its very roof at its eastern extremity, and it is with consternation that they learn that this work of destruction by incongruous addition is likely to be carried still further if measures are not taken to stop such desecration. It is not merely that the erection in question is of common brick, in contrast with the Portland stone of Chambers's work. What is most to be insisted upon is that Somerset House being a symmetrical composition, its lines cannot be altered without its charm being destroyed. The inharmonious excrescence which has just appeared above its fair outline may subserve a very useful purpose; but is nothing to be held sacred from the demands of utility? Are our senses so dulled by the hideous sky-signs and other vulgarities under which the London of our day is groaning that we can passively allow one of the buildings of which we have the greatest reason to be proud to be mutilated without a protest? If, as is the practice in Paris, the designs of all structures likely to interfere with our public buildings and our principal street views had to be submitted before their erection to some body of experts fit to pass a wise and unprejudiced judgment on them, some most regrettable blunders would doubtless be avoided.

Mr. Lewis Angell writes:—Some years ago a dining-hall in the basement of King's College, adjoining Somerset House and the Thames Embankment, collapsed, due, it was said, to our neighbour the underground railway, but no compensation was obtained. We are now told by another neighbour, Somerset House, that we must not raise our roof because it will interfere with architectural "repose," but, again, no compensation. In your issue of November 30 Mr. Waterhouse, representing architecture as an art, denounces, with "indignation," the addition to King's College as an act of "desecration," an "incongruous addition" and more of the same kind. But, notwithstanding the abstract righteousness of the æsthetic enthusiasm of Mr. Waterhouse and his forcible repudiation of the "demands of utility," is there not a practical side to the question? When a private owner erects an edifice which he intends shall be "a thing of beauty and a joy for ever," he takes the precaution to secure a surrounding zone which can never be "invaded" by any "inharmonious excrescence," or if he lays out a building estate, conditions are imposed; but when he builds in a street he takes his chance as to the surrounding amenities of the future, and, however æsthetic, it would be neither business nor logic to expect his neighbour to subordinate his interests to sentiment. In the case of Somerset House, the nation is the owner and the Embankment is the street. The nation is very rich; King's College is very poor. The extension of scientific education, "the demands of utility," requires more accommodation, and the college cannot enlarge or change its site, nor afford to erect palatial buildings. If the nation will provide, as it can well afford, the required accommodation, the college, doubtless, will be only too ready to assent and assist, but the college cannot afford to live, nor is it prepared to die, on what Mr. Waterhouse terms "symmetrical composition." By all means let Somerset House "be held sacred," and "measures" be "taken to stop such desecration," but, concurrently, let measures also be taken to maintain King's College in its "very useful purpose" of meeting "the demands for utility." The quotations are from Mr. Waterhouse.

It was announced by Messrs. Stephen Salter & Adams on Tuesday that the brick building was not to be raised any higher.

SHORING BUILDINGS.

THE following judgment was given by Mr. Justice Charles in the case The New Westminster Brewery Company, Limited, *v.* John Rees and Messrs. Grover & Sons:—

In this case the plaintiffs seek to recover damages to their premises at No. 13 Carnaby Street, Regent Street, caused by the negligent pulling down and demolition by the defendants of Nos. 15 and 16 in the same street. The facts are as follows:—The plaintiffs were in September 1890 mortgagees in possession of No. 13 Carnaby Street for an unexpired term of 9¾ years. The premises were used as a public-house and were occupied by Mr. Henry Hilliard, a licensed victualler; No. 14 was occupied by Alexander Smith, a builder; and Nos. 15 and 16 belonged to the defendant Rees. All the houses were very old. They had apparently been built at the same time and were not detached, but were mutually dependent on one another for support. Prior to the month of September, the defendant Rees had contracted with the defendants Messrs. Grover & Sons to demolish Nos. 15 and 16, and on August 23 the work of demolition was commenced. As the buildings were removed "raking shores" were placed at the front and back of No. 14 and "flying shores" across the space left between Nos. 14 and 17 by the removal of Nos. 15 and 16. These "flying shores" were at right angles to the walls of Nos. 14 and 17, and it is proved to my satisfaction that they were five in number. Smith, the tenant of No. 14, said that there were only four, and that the lowest shown on the model used at the hearing did not exist. But he is contradicted by numerous witnesses, and I think his recollection is at fault. Whilst the basement of No. 15 was being uncovered a bulge was noticed in the wall of No. 14 about 9 feet or 10 feet from the ground, which was about 3 feet measured vertically, and somewhat longer horizontally, and according to the evidence of the defendants' foreman, projected about 2 inches. He did not at first regard it as of any importance, but he stated that on September 3 or 4, the same day on which the lowest or fifth "flying shore" was put in place, there was placed against this bulge a small "raking shore." There was a conflict of evidence as to this precaution having been taken, and I do not think the evidence with regard to it is so satisfactory as that which was given about the fifth or lowest "flying shore." Walton, the man who was called to confirm Cattermole on the matter, did not seem to me to have a really clear recollection about it, and it is noticeable that Buckell, his fellow-workman, when called, only spoke to having put up the lowest "flying shore" on September 4, and did not remember that there was any bulge in the wall at all, and in the defendants' answer to the third interrogatory, nothing is said about it, nor, indeed, about the fifth "flying shore." On the contrary, according to that answer

no fresh precautions were taken after August 29, on which day a notice was received by the defendants from the architect of the London County Council that the wall between Nos. 14 and 15 was in a dangerous state. Assuming, however, that all the shoring shown on the model produced was *in situ* on Thursday, September 4, I have now to inquire whether it was reasonably sufficient for the purpose for which it was used. Unfortunately it did not answer that purpose; for on the evening of Sunday, September 7, No. 14 fell into the street, carrying with it in its fall some pieces of the wall belonging to Nos. 13 and 14, and leaving the whole of the wall belonging to the two houses exposed. What, then, was the cause of this collapse? The plaintiffs contend that it was owing to the negligent and insufficient "shoring" of the premises. The defendants contend that it was owing to the inherent weakness and defects of the party wall belonging to Nos. 14 and 15. Now the wall was and was known to be an old wall. It certainly was in some respects indifferently constructed. Mr. Brereton, architect and surveyor, says that he thinks it was originally ill-built and improperly bonded. Mr. Chambers says that the basement was unsound, and that there was no proper bond between back and front. Mr. Robert Kerr says that it was badly built and carelessly bonded. Mr. Grover, one of the defendants, speaks also of its bad construction, and Mr. Cattermole, the foreman of the defendants, says that, although the wall appeared sound, upon inspection after its fall he discovered that there was no tie or bond whatever. "Some of the bricks," he added, "were on end." "The wall looked like a casing with bricks thrown in anyhow. Some of the bricks were half bricks. They were crumbly and all rubbish." On the other hand, Mr. Smith, a builder, and tenant of No. 14, Mr. Charles Fowler, architect, Mr. Hamilton and Mr. Lovegrove, who were called as witnesses on behalf of the plaintiffs, gave a more favourable account of the wall. It was not accurate, they said, to describe it as "not bonded" to the back and front walls. In their opinion it had been so bonded; and it was an exaggeration to describe it as a mere brick casing, with little more than rubbish in the centre. The bricks were not, indeed, regularly placed, but the wall was throughout a solid brick wall. I had the opportunity of seeing the premises after this evidence had been given, and I came to the conclusion that on this part of the case the plaintiffs' witnesses represented more accurately than the defendants' the actual condition of the wall. It was, in my opinion, in fairly good condition for an old wall, and I cannot accept the theory put forward by Messrs. Brereton, Chambers, and the other witnesses called by the defendants, that it slipped down on itself owing to its inherent infirmities. An attempt was also made to attribute the fall of the wall mainly to a defective bressummer. But this was not strenuously insisted upon, and I am satisfied that the condition of the bressummer had nothing to do with the wall's collapse. The cause of that collapse must be sought elsewhere. It is not to be found, I may here remark, in the excavating operations. Upon this point both sides are agreed. No settlement of any kind took place before the wall fell. Again, I do not attribute the accident to the use by the defendants of "flying" instead of "raking" shores. I think they were perfectly justified in using the former. In doing so they were following a recognised practice of competent builders, and, so far as I could form an opinion from the evidence given on the point, I thought that they proved, not only that they practised a well-known method, but that it was the better method of the two. However this may be, it is clear that the use of the "fliers" and not "rakers" cannot in itself be called a negligent act. But this leaves open the question whether the "shoring" was reasonably sufficient, and, after a full consideration of all the circumstances, I have come to the conclusion that it was not. I think that the shoring of the lower portion of the wall was inadequate, having regard to the existence of a bulge of the size and character described by Cattermole. It is said that this bulge was old; but whether old or not I cannot doubt that it was dangerous when the support afforded by No. 15 was withdrawn, and yet, although it was observed on August 28, no step was taken until September 4 to secure the wall. Mr. Brereton says that he should consider a 2-inch bulge rather serious. Cattermole says it was nothing unusual. I think Mr. Brereton was right. Mr. Charles Fowler says that when the wall was exposed this bulging should have attracted the notice of any one of competent skill, and that the lower part of the wall should have been supported by at least three "raking" shores. Only one, on the most favourable view of the defendants' evidence, was provided, and that not until the mischief had been increased, for nothing at all was done until September 4, and in the interval there can be little doubt that the wall had become more insecure than on August 28, when Cattermole noticed the defect in the wall existed. It is to be observed that this bulge, although asserted to be an old one, was not observed by Mr. Kerr, consulting architect of the County Council, on August 26; and I infer that before the 26th and 28th the wall must have been moving, "and if so, then," says the same witness, "special precautions would be necessary." None were taken until too late, and even then no sufficient precautions were taken. In my judgment, therefore, the fall of No. 14 must be attributed to the inadequate shoring by the defendants of the lower part of the party wall between Nos. 14 and 15. This finding entitles the plaintiffs to damages, but I cannot adopt the measure of these damages presented to me by the plaintiffs. They allege that their tenant was obliged to quit the house, and it is true that for a time he was obliged to quit occupation. He could not safely continue to occupy the house until the wall between Nos. 13 and 14 had been properly secured. They further say that the freeholder urged them to rebuild the wall, which, as their term was only $9\frac{3}{4}$ years, they were indisposed to do, and they accordingly surrendered their term. They now ask the defendants for compensation for the loss of the profit which they would have made during the unexpired term. This is not, in my opinion, the true measure of damages. What they are entitled to is the value of the actual damage done to the wall by the fall of No. 14, and also the sum which they would have had to expend to make the wall safe. It may be that the wall would have had to be rebuilt. This must be a matter for investigation by a referee, who will report to me what sum he arrives at upon the basis which I have indicated. I reserve all questions of costs until I receive his report.

THE ROYAL SCOTTISH ACADEMY.

THE prizes obtained in the Life School of the Royal Scottish Academy have been presented to the successful students by Mr. George Reid, the president.

The Secretary read the report of the visitors to the Life School and the report of the Council of the Academy containing their awards. The Chalmers Bursary was awarded to James Coutts Fraser, an extra prize for painting to James Riddel, the Chalmers-Jervise prize for the best drawing from the life to P. P. Mackie, the Maclaine-Watters medal to James Riddel, the Keith prize for the best work by a student in this year's exhibition to John C. Mitchell and David M. Smith equally.

The President then delivered his address. After alluding to the death, since the awards of the Council were made, of a student whose work had been deemed worthy of honourable mention, and mentioning that there was perhaps some ground for believing that the malady of which he died (disease of the lungs, it was understood) was aggravated by, if it did not originate, in the close and hot atmosphere of the Life School, he said that if that were so, it was not the first case of the kind he had known in the Life School. He had long felt that the system followed there of working at night by gaslight was a bad one, and he hoped that by-and-by the Academy would be able to abolish all night-work, and with it all painting by gaslight in its Life School, and that the work there might be carried on, as it ought to be, in fair, honest daylight. Proceeding to refer to the work done in the Life School during the past year, he said he wished it had been his pleasant duty to speak words only of commendation, but that, unfortunately, there was much, very much, still to be desired in the painting and drawing of the students from the living model. There was cleverness, he admitted, in many of the works shown, but mere cleverness without a solid foundation of knowledge was not a very estimable quality in a student's work. Knowledge, accuracy, thoroughness were the qualities to be sought for rather than mere showy brushwork. In the drawings from life the same faults were to be found; while many of them were clever, few or none of them showed any very thorough or accurate knowledge of the human form. The defects to which he had called attention in their Life School work appeared to him to be largely due to a want of thorough training, especially drawing from the antique. It was too much a habit among students to look upon that part of their education as little better than a dreary preliminary, to be got over and done with as quickly as possible. This insensibility to the wonderful beauty of the antique, and especially to the work of the old Greek sculptors, was largely due to the unsatisfactory system of teaching in their art schools throughout the country. The young student found himself in a gallery of casts from the antique. He probably knew little or nothing of the history of Greece, of Greek mythology, or of Greek art; he only saw a number of more or less mutilated figures. The gallery of antique casts was, indeed, like a battlefield after an engagement. It was hardly to be expected therefore that the enthusiasm of the student would be awakened if he was left to work on in a dull, mechanical way; but once get his eyes opened to the beauty and to the meaning of what he was attempting to draw, and the entire aspect of things would be changed. Instead of drudgery, work from the antique would become a source of interest and enjoyment. It was in the hope of awakening a fresh interest in the study of the antique that he proposed on this the first occasion on which he had had the pleasure of addressing them, to direct attention to some influences to which Greek art—and by Greek art he meant exclusively Greek sculpture—owed its origin and development. The President then pointed in detail

to the influences which the natural surroundings, the public polity, the mode of life (notably the great love of gymnastic exercises), and, above all, the religion of the Greeks were bound to exert over their art. The old Greek sculptor had constantly before his eyes the models of manly and womanly perfection and beauty; and if for a moment they contrasted the past with the present, they could not fail to see the enormous disadvantages under which the student of the human form rested to-day in regard to his models. Let them look at the physical and moral degradation of their population, especially in the large manufacturing towns—a poor, puny, white-faced race, poisoned by bad air, and tea, and tobacco, often degraded and brutalised by intemperance, indifferent alike to physical training and to physical beauty. The student of to-day asked for the living model, and the Academy provided the best it could find; but that best was, after all, but a poor thing in comparison with what Greece two thousand years ago could show. If they wished to learn something of the highest, the most perfect type of physical beauty the world had ever seen, or was ever likely to see, they must learn it from the Greek sculptures. They would seek in vain for it elsewhere. Let them not think that when they entered the Life School their study of the antique was ended; rather let the study of the living model send them back to it again with a fresher, keener, more appreciative understanding of its matchless beauty and perfection.

Mr. John Hutchison, R.S.A., treasurer of the Academy, in moving a cordial vote of thanks to the President for his address, said that his (the President's) career as a student, as an artist, and as the head of the Academy and a highly-cultured gentleman, might well serve as an example to those who were beginning their artistic career.

The proceedings then terminated.

SOLIHULL HALL.

A PAPER was read last week, before the Birmingham Archæological Society, by Mr. J. A. Cossins, describing some discoveries of considerable interest which he has lately made at Solihull. Solihull Hall is a moated and half-timbered manorial residence of the fourteenth century, which may be seen peeping out from the trees on one's left at about three hundred yards before Solihull is reached by rail. The place, which is characteristic of the houses of the smaller lords, consists of a great hall in one storey and a transverse building of two storeys, which contains on the upper floor a large room, with an open roof and a dormitory, and on the ground-floor two rooms, which were probably the kitchen and the buttery. The building has been converted into a comparatively modern dwelling-house, and is occupied by Mr. J. Llewellyn Ryland. Additions have been made to it and its internal features masked; but Mr. Cossins has been able to make a complete drawing showing its ancient appearance. The hall is covered by a roof carried by three fine arched principals of different designs. The entrance was by a porch into a passage crossing the hall at the south-west end and divided off from it by a screen. At a height of 7 feet this passage was floored over, forming an open gallery which served for the minstrels when great feasts or festivals were going on, or for the ladies, from which to view the proceedings going on below. At the opposite end of the passage is another doorway, which led into the courtyard, and from the passage also there were doors which led to the buttery and the kitchen. In most halls of any great importance there was at the opposite end a platform or daïs raised one or more steps above the floor, on which was the high table for the lord and his principal guests. But this was not usual in the moderate and small-sized halls, and here there is no trace of it discernible. Beyond the north-east end of the hall Mr. Cossins thinks there was another building, containing possibly the cellar, and possibly some other of the offices. The interior of the hall, and especially the open-timbered roof, is wonderfully like that of Baggilly Hall, in Cheshire, with the exception that in the latter the timbers are cut into trefoils and quatrefoils. The lower portion of the walls has been rebuilt in later times with brickwork, but Mr. Cossins is pretty certain that there were no windows except in the usual place, namely, above the horizontal plate of oak which runs round the hall at a considerable height, where, indeed, he has traced them. Above the plate the walls were built alternately with vertical timbers and wattled spaces of equal width. These walls have served to keep out wet and cold very effectually for more than four hundred years, though their thickness is but 3¼ inches. There is not a crack in the plaster nor the thinnest space between the plaster and the wood. The timbers of the roof are all chamfered and held together by pegs, there being, probably, no single piece of iron in all the framework. Windows of this period were seldom glazed, except in very important houses, and the openings were closed with shutters. There would be a brazier in the middle of the apartment, the smoke escaping through a louvred turret in the roof; and indeed the timbers just above are blackened and covered with soot. The floor was probably nothing but well-rammed earth, which was the custom in middle-class houses. In the two-storeyed portion the principal room is the "solar," a feature of the halls of this century, but lacking when, a century earlier, the king or the lord slept with his retainers of both sexes in the hall. It was the private sitting-room and bedroom of the lord. Here he received his principal guests, and they commonly occupied it with him and his lady at night, though it is extremely probable that screens and curtains were occasionally put in order to secure a certain degree of privacy. Mr. Cossins pointed to evidence in this connection that the lords of manors of that time were more ignorant and possibly less refined than our agricultural labourers of the present day; and recalled the fact that in Piers Plowman the rich were bitterly upbraided for their arrogance in withdrawing themselves from their servants to eat in private rooms and corners. The solar has an enormously massive roof of a remarkable character, of which the central beam in the middle truss is 24 inches deep and 8 or 9 inches thick. Of the moat only two sides remain, but the position of the parts filled up can be traced. Who built the hall is quite uncertain. Dugdale speaks of the Barons Limesie, of Ulverlei (Solihull), and of their estates passing to the family of the De Odinsells. He suggests that the barons lived at Olton, and Mr. Cossins thinks it possible that Solihull Hall may have been the chief seat of the barony. With a view to further illustrate the manners and mode of life of the fourteenth century, Mr. Cossins reconstructed from historical evidence the furniture and decoration of the hall, and quoted from an antique rhyming manual, on the lines of the modern handbook "Don't." He was awarded a hearty vote of thanks, not only for his paper, but for his services to the society during a quarter of a century. In reply he said that somebody should write a history of Solihull, which is rich in materials.

COMPARATIVE ARCHITECTURE.*

COMPARATIVE architecture bears the same relation to historical architecture, or the history of architecture, as comparative ethnology does to general ethnology, or comparative anatomy does to general anatomy. Architecture is not a science; its laws cannot be predicated; it has a personal element, the imagination of the artist or of the architect, which is absent in the true sciences. But it is a subject that may be treated both descriptively and historically, and it is therefore possible to treat it comparatively. Few methods of study have added so much to human knowledge as the comparative. We live in a comparative age. We have comparative zoology, geology, physiology and multitudes of kindred subjects that have opened new fields of culture, broadened knowledge, made us familiar with forms of life and natural laws which otherwise would have been neglected. Some of the most important results of recent learning have been achieved in comparative philology, and in every department that the comparative method has been applied to fresh and important information and greater interest have been forthcoming.

Architecture is the least imaginative of the arts. It is concerned with practical questions, with materials, environment, climate, geology, products of the earth and many other circumstances which make it eminently useful, as they take it away from the artistic. But while architecture is limited by these requirements it is impossible to look for a law of architecture whereby results may be predicated. The possibilities of neither the historical nor the descriptive methods have been exhausted, but the comparative will help to a clearer understanding of our present knowledge, and make future work more intelligible.

To suggest a definition, comparative architecture takes the facts of historical and descriptive architecture, and describes the comparative progress made by all nations under every condition. It takes the substance of the art, its materials, the climate in which characteristic styles have developed, the national or governmental conditions under which they have flourished, the ethnographic relations of the people, the geological peculiarities of architectural districts, the distinctive social and mental qualities, notes the influence of the allied arts, of religion, temperature, use, civilisation, constructive ability and methods, and every cause which in one way or another, to a greater or less extent, has operated in the production and formation of architecture in all times and ages. It is independent of a definition of architecture; it does not matter if climate, country, nationality and other conditions are considered an integral part of the definition of the word or art of architecture. No architecture of any kind is possible without these influences or causes, though their effect may not always be visible, or visible to the same degree. It calls for no straining of definitions to make these things subjects of study, and they

* Abstract of a paper communicated to the American Institute of Architects by Mr. Barr Ferree.

are therefore grouped under what, for want of a better name, I have called comparative architecture.

In a history of architecture composed on the old historical form, the author would arrange his subject in countries, and under each would perhaps note the effect of the various causes that have just been enumerated. The result would be a series of chapters in which the reader would have to begin at the beginning each time, and note the influence of, for example, religion, materials, &c., in each country separately, without having a general idea of the actual manner in which materials, construction, religion, &c., have affected architecture as a whole.

In the comparative method the chapters would be headed, not with names of countries, but with names of influences, as materials, construction, religion, and the effects of each would be noted in their varying degree in each country where architecture had flourished. No general view of the history of individual styles would be obtained by this means such as the text-books now offer us, but comparative architecture is intended to supplement present work and present methods, not to take their place. Architecture is shown as a natural art, evolved under natural conditions, not a succession of historical facts with disputations on dates and problematic conjectures, nor a combination of descriptions giving the numbers of doors, windows, columns and square inches of ornament in every building under the sun. Comparative architecture does not concern itself with the history and description of styles, but with reasons for their existence.

We live in an age of inquiry. It is not sufficient to state facts, it is necessary to give reasons why, and reasons that all can understand. Historical students deem nothing too insignificant for the illumining of the events they describe, and the most microscopic researches have often returned the richest results. Similar researches into the history of architecture cannot have other than beneficial results. Under the treatment here proposed, architecture acquires a new meaning and purpose that it would never have had while viewed solely in the historical and descriptive manner. Styles, methods, results, variations, are explained, and their relationships. Reasons for the prevalency of certain forms under certain conditions are given, and the art appears no longer as the product of the imagination, the creation of fancy, but the outcome of natural, reasonable, sensible, useful, and at the same time beautiful conditions of different natures originating under different conditions.

The more closely the reasons of architecture are examined the less spontaneous it appears, the closer it approaches the domain of law, though without entering it. Ornament remains outside any such influence, and the personal element thoroughly prevents architecture from being regarded as a product of an evolution in the sense that a plant or any animal may be so regarded. But it is not entirely the result of personal whim, fancy, pleasure or imagination. The Assyrians did not build their immense vaults because they pleased them, but from the nature of their climate and the building materials at their hand. It is impossible to refer the production of a historical style to any one set of phenomena; it is not impossible to get further than general groups; but notwithstanding their uncertainty, they show architecture to be a living, progressive, reasoning art, reflecting the deeds and nature of man with a fidelity surpassed by few records.

The influence the comparative method may have in extending popular interest in architecture is not the least important of its elements. The dull record of historical sequences, the detailed examination of styles and their characteristics, the warfares over nomenclatures, the strict chronological chronicling of buildings in all times and ages, will never give the animation to architectural study it so sadly and obviously needs. There is no greater evil in architectural study than isolation. Architectural students forget the co-ordinate relations of their art in its beauty and artistic merit. No just estimate of all the works of men can be possible which does not take into account their buildings, even though their æsthetic value is neglected. Yet historians of architecture do not hesitate to prepare essays in which the great historical events that have rendered the subjects of their discussions possible are ignored or scarcely referred to. A building is a thought, an idea, an intellectual product, and must be treated as such in every intelligent study. Viewed alone, the greatest monuments are deprived of much of their value. The Parthenon, Notre Dame and other great buildings typify ages and intellectual movements as well as developments in construction and epochs in styles. It is not enough to describe them apart from their environment, nor can the men who built them and their intellectual and historical positions be passed over in a few words. It may seem formidable to say that the history of architecture is the history of humanity, and that one cannot be understood without the other; but is it well to continue in present lines if they are not sound or if they do not rest on firm foundations?

Architecture, both as an art and as the science of construction, suffers from a lack of popular interest. It is not popular as china painting, decorative upholstery and other alleged arts are, and both painting and sculpture surpass it in general estimation and interest. It is not exaggeration to attribute much of this indifference to the dull prosing way in which writers on architecture have presented their subject. I am not without hope that the comparative method when properly handled by competent hands may introduce a change for the better. Clearly, if architecture is to become popular, some new method must be adopted for its general treatment. People take an immense interest in many dull and far-away subjects. Lectures on psychology, political economy, even Hebrew and Assyrian are crowded with eager and appreciative audiences. Architecture is surely in more intimate touch with the masses than any of these. If the fault is not in the subject it must be in the methods.

Architecture is now almost the only form of knowledge that is not treated in a scientific manner and viewed as a reasonable product of reasoning minds. The comparative study of monuments now forms the basis of the best work of the most advanced archæologists. But their method is perhaps better to be called analytical than comparative, but in no case does it go far enough. If important events can be ascertained by the analytical studies of co-ordinate groups of buildings, it should not be less valuable or productive of less instructive and interesting results to apply the same method to buildings which are not so intimately related. All buildings are products of a human intellect, and in a certain sense they all have the same end—that of fulfilling some of man's necessities. Architecture is eagerly seized as a subject of study when there is absolutely nothing else to learn of departed races, but when it is one of many forms of remains of past civilisation, it is viewed as an æsthetic art without due appreciation of its proper uses.

Modern architecture, as well as ancient, is a proper subject for comparative treatment. Architecture is limited by circumstances and conditions to-day as in the past; they are not the same conditions, nor do they have the same results, but they still form legitimate subjects of study in the manner here proposed.

CEMENTS AND CONCRETES.

THE first lecture of the present session, promoted by the Leeds and Yorkshire Architectural Society, was delivered on Monday in the Leeds Law Institute, Albion Place, by Mr. Wm. Bruce, F.R.S.A., whose subject was "Cements and Concretes." Mr. W. H. Thorp (president of the society) occupied the chair, and there was a good attendance.

The Chairman briefly introduced the lecturer, who, he said, was engaged in the superintendence of the erection of commodious business premises in Park Row, Leeds. The Chairman further said that the lecture should prove instructive, for, speaking personally, he had to confess that he had not much knowledge of cements, being, like many other architects, largely dependent upon his clerks of works in this respect.

The Lecturer said that if Leeds architects, contractors and workmen were not interested in his subject, he did not know who would be, for it was a Leeds bricklayer who invented Portland cement, though his invention was a dead letter for a long time. It gratified him (Mr. Bruce) to say that he had with him Mr. Jones, President of the Bricklayers' Union in Leeds, who had kindly consented to assist him in his lecture. Proceeding to deal with his subject, Mr. Bruce said that up to the middle of last century England drew its supply of cement chiefly from Italy; but in 1796 a compound of London clay, which owing to its appearance was termed Roman cement, was the subject of a patent taken out by Parker. In 1824 Joseph Aspdin, a Leeds bricklayer, took out a patent for an admixture of limestone and clay, which, from its resemblance to Portland grey stone, acquired the name of Portland cement. This cement, the lecturer said, was of considerable utility in the construction of the Thames Tunnel. In 1848 Britain, he said, had only four important cement works, and the first really important one was started in 1859. Mr. Bruce pointed out that the German cement manufacturers long ago formed an association, and drew up standard rules defining the qualities of cement, and laying down methods of testing, and it was owing chiefly to this wise co-operation of her merchants that Germany was now turning out such large quantities of cement. Hitherto, English manufacturers had not generally seen the desirability of adopting a similar course. After touching on various technical points in relation to cement, Mr. Bruce went on to speak of concrete, and confined his observations in this connection chiefly to technical advice to his audience. Going on to speak of local matters, the lecturer said he had been much surprised and disappointed with the condition of house drainage in Leeds. When he came to Leeds some fourteen months ago, he was surprised to see, and could not understand why, the municipal authorities allowed and approved of such work as could be seen any day in any district of the borough. He had had charge of large and important buildings in many towns, and had met some of the

most intelligent engineers, and their experience of other towns had been that building inspectors and borough engineers had encouraged improvements in sanitary science. But a very short time spent in the Leeds Municipal Department was sufficient to show that the building by-laws were not administered in accordance with the principles of modern sanitation. The great mistake was in the erroneous administration of the by-laws. Very little or no provision was made for the ventilation of house-drains in Leeds; but there was an ancient and faulty system of large gullies discharging into drains formed with injuriously large pipes, badly laid and badly ventilated.

The lecture, which was illustrated by means of samples, tests and tables of test-results, was attentively listened to. Discussion followed, and at the close, on the motion of Mr. C. Myers, seconded by Mr. W. J. Mettam, a vote of thanks was cordially given to the lecturer.

ROMAN COLLECTIONS.

THE subject of the Roman art galleries is still under discussion. It appears, writes a correspondent to the *Manchester Guardian*, that the Government had not been consulted about the removal of the pictures of the Borghese gallery from the family palace to the villa outside the walls of the town. In consequence the Minister of Public Instruction has notified Prince Paolo Borghese that he must replace them in their former position. It is thought that Don Paolo will disregard the order, as he has taken the attitude of asserting the full rights of proprietorship. He has just concluded the sale of the Borghese archives to the Pope for the sum of 250,000 francs (10,000*l.*). The most important portion of this collection is 400 manuscripts which constitute the history of the Popes at Avignon, and which were thought to be lost. The Vatican archives contained no documents of this period. It is now supposed that the manuscripts must have been placed in the Borghese archives by Clement VIII. and his two brothers, the Cardinals Aldobrandini. This sale is not an infringement of the Pacca law, which only extends to works of art. But the Borghese family are in possession of collections as valuable to art as any pictures or statues—manuscripts, majolicas, ancient coins, and a splendid collection of silver belonging to the Princess Pauline, sister of Napoleon. For fear lest these should be disposed of with as little ceremony as the archives or the Cæsar Borgia, the Minister of Public Instruction has issued an ordinance by which such collections will be liable to visits of inspection from the Government, without whose consent they are not to be displaced. Prince Borghese has, besides, been legally warned against alienating any of the works of art in his gallery; but has, as I before said, asserted his full right of proprietorship. The question has been submitted to the Court of Exchequer, and Signor Villari and the Syndic of Rome will shortly hold a consultation on the whole question of the Roman galleries.

The Court is in treaty with Prince Barberini for the purchase of the Barberini Palace, which is to become the residence of the Crown Prince. The sum asked is 15,000,000 francs, while only 10,000,000 are offered.

Correspondence

Architecture—A Profession or an Art?

SIR,—Mr. Woodward's letter to the *Times*, reprinted by you last week, is, I think, the most amusing contribution to this vexed question that has appeared—amusing alike in the comicality of its metaphorical suggestion and its unconscious furtherance of the views it is trying to attack; an unwitting assistance which is none the less diverting because it clearly arises from complete misconception of those views. What are we to make of Mr. Woodward's confession of inability to stand by and see men performing the truly amazing feat of "riding off on the cant of art, kicking up as they go mud at that Institute," &c.? Who could consider such a performance, actual or metaphorical, "quietly"? From this mysterious passage Mr. Woodward passes lightly to an invitation to Mr. Jackson to watch a lay figure for *signs of vitality*, which signs are mysteriously contingent upon that gentleman's acceptance of the truth of five portentous statements.

I have nothing to say against these statements—they are excellent upon the whole; and it is precisely because we admit and feel their truth that we have expressed our views in the memorial which has brought about this controversy. It is precisely because the sanitary, constructive and decorative work of an architect is so often relegated to specialists, because the art of building, the real trade of the architect, is constantly neglected for business concerning building, which has nothing to do with it, and because the best opportunities of the artist are so frequently entrusted to tradesmen, that we strive to free our art from that engrossing professionalism which absorbs so much of the time and energy that should be devoted to it.

Mr. Woodward concludes extremely funnily; he has more confidence, he says, in the "artist, man of science, and man of business" than in "the emotional, maudlin designer of original ugliness, household furniture, paper-hangings and table-covers." A nice derangement of epithets truly. Who would have confidence in a man who was not only emotional and maudlin, but a designer of ugliness, original or otherwise? And why is original ugliness placed in the same contemptuous category with household furniture, paper-hangings and table-covers? Does Mr. Woodward consider the designer of these useful articles to be emotional and maudlin of necessity, or is this merely a decorative flourish to his mysterious epistle?

With the courteous and temperate letter of Mr. J. M. Brydon there is little fault to find. He puts his view of the case with clearness and moderation, but it is not the view of the memorialists, and what he alludes to as "little differences" are to them such great and vital differences that they prevent the acceptance of his kindly invitation "to come in and help their friends inside the Institute."—Yours faithfully,

E. P. WARREN.

18 Cowley Street, Westminster, S.W.:
Dec. 2, 1891.

GENERAL.

The Prince of Wales has purchased four paintings by Messrs. Carlton Smith, J. Macmaster, Charles Mottram and R. T. Kelly, from the winter exhibition of the Royal Society of British Artists.

Mr. George Reid, president of the Royal Scottish Academy of Painting, Sculpture and Architecture, has received the honour of knighthood.

M. Eugene Müntz began his course of lectures on "Æsthetics" at the Ecole des Beaux Arts, Paris, on Wednesday.

Mr. Whistler's *Portrait of My Mother* has been bought by the French Government for the Luxembourg. Some years ago it was exhibited in the Salon. The price paid is nominal, but it will be the sole representative of English art in the gallery.

Mr. R. F. Grantham will read a paper on "The Sewerage of Maldon, Essex, with some Observations on Recent Practice in Sewer Ventilation," at the meeting of the Sanitary Institute, at the Parkes Museum, on Wednesday next.

A Paper on "Ancient Lake Remains at Felstead," by Mr. J. French, was read at the meeting of the Essex Field Club, at Loughton, on Saturday last.

A Pulpit of carved oak, designed by Mr. Ewan Christian, has been placed in Romsey Abbey Church.

Mr. C. H. Bedells, F.S.I., will read a paper on "Party Walls and Party Fences," at the meeting of the Surveyors' Institution on Monday next.

Mr. P. H. Rathbone gave an address on "Water-Colour Drawings," at the Walker Art Gallery, Liverpool, on occasion of the holding the third *soirée* of the season.

Rev. F. F. Grensted, at the meeting of the Liverpool Architectural Society on Monday, will give a lecture on "Egypt as a Home of Early Art."

Mr. G. F. Bodley, A.R.A., has prepared a design for the proposed Archbishop Thomson Memorial, to be raised in York Minster.

St. Anne's Church, Lancaster, erected in 1796, is to be rebuilt at an outlay of between 3,000*l.* and 4,000*l.*

Mr. G. M. Lawford will read a paper on "The Drainage of Town Houses" at the meeting of the Society of Engineers on Monday, the 7th inst.

The Cambridge Antiquarian Society intend to publish the early Grace Books of the University as a memorial of the late Dr. Luard, who rendered many services to the Society.

M. H. Kieffer, a Swiss architect of distinction, has died in Geneva, where he was born in 1840. After studying in his own country and in France, he practised for some years in Italy, where, amongst other buildings, he designed the villa near the Porta Pia, where Victor Emmanuel passed his later days. He received the cross of the Order of the Crown of Italy as a testimony of the King's satisfaction.

The Works to be carried out in the front of Ramsgate at a cost of 60,000*l.* have been formally commenced. The works consist in the building of a front approach to the two cliffs, the construction of a new military road across the inner harbour, and the widening of the approach to the London and Chatham railway station, together with the building of a new custom-house and harbour-master's house.

The Architect.

THE WEEK.

So much vigour remained in M. Alphand in spite of his partial paralysis, that the doctors were to be excused for assuring the people of Paris a few days before his death that his illness was not dangerous. The city has lost in the director of works the most efficient of ediles. The variety of his responsibilities was almost incredible. The paving and cleansing of the streets, the water-supply, the purification of the Seine, the drainage, the public gardens and open spaces, the canals for navigation, the public buildings—in fact, all works which were paid for out of the municipal taxes came under his supervision. In addition, the works of painting and sculpture could not be purchased for the adornment of the city without his advice. The investigations of the history and topography of old Paris were also among the works of his department. His staff comprised architects, engineers, surveyors, chemists, statisticians, meteorologists, artists, archæologists, and one of his chief officers was a poet. His will was law, and many an architectural feature exists in Paris which is contrary to the letter of the building regulations, but which could not be removed because he approved of it. The architects of Paris were well aware of his power and how it would be exercised in their behalf whenever it was a question of saving or sacrificing a good design. M. Alphand was by profession an engineer, one of the representative men of the Ecole Polytechnique. He was brought to Paris from Bordeaux by Baron Haussmann, to whose schemes of transformation he gave reality. M. Alphand was occasionally invited to London to give evidence in support of Bills introduced by the Metropolitan Board of Works, and on all questions relating to municipal works he was the first of authorities. His crowning work was the last international exhibition, and the occasion was utilised to express the indebtedness of Frenchmen as well as Parisians for his numerous services.

A meeting of the Royal Hibernian Academy was held in Dublin on Tuesday, December 8. Mr. William Osborne, R.H.A., was elected a member of Council to fill the vacancy caused by the death of the late Mr. James Farrell, R.H.A. Mr. Thomas Farrell, R.H.A., was re-elected, and Mr. S. Catterson-Smith was elected to represent the Academy on the Board of Governors and Guardians of the National Gallery of Ireland. A letter was also read intimating the Lord Lieutenant's approval of the election of Mr. S. Catterson-Smith as secretary of the Academy.

It is to be devoutly wished that we are not to have any more revelations concerning the Works Department of the London School Board. Mr. Helby, the late chairman of the Works Committee, has, however, described some actions which may be the prologue to an exciting drama. It appears he went to the office to separate papers of a personal character from official documents. He was informed that the letters and the letter-book had been taken. "As many of the letters were of a personal nature," he writes, "I cannot regard such a proceeding as other than an improper act, and one which, as a matter of principle, should be dealt with by the Board. When Mr. Copeland Bowie, in a similar manner, obtained from the clerk during my absence from the Board offices the copying letter-book, I took no notice of the action, as his conduct towards me was uniformly discourteous, but I think that the Board should understand that actions of this kind destroy all discipline in any department, and render the administration of the work more difficult than it otherwise would be." But that is not Mr. Helby's only grievance. He states that a clerk in the architect's department went to the room Mr. Helby formerly occupied as chairman of the Works Committee, after he had been there, in order to go through the papers which he had left in the desk, and the architectural clerk abused the clerk who was, at Mr. Helby's request, burning some useless papers, calling him a scoundrel, and saying that the papers were destroyed in order that they might not be seen. Mr. Helby says that such a remark, reflecting upon the character of a member of the late Board, under whose chairmanship the clerk in question had so recently served, is subversive of all discipline, and calls for the serious attention of the Board, especially as such a statement has no foundation in fact. These revelations do not suggest that harmony exists among the members of the Board, and it would be well to institute some course which might insure a more frank recognition of the right to differ.

The sum of a million francs, which M. Emilio Terry, a Cuban, has paid for the château of Chenonceaux, will form but a part of the expenditure which is involved in the acquisition of so historic a property. The new owner contemplates a reconstitution of the building in order to adapt it to the necessities of modern life. M. Terry is also the possessor of a house in Paris for which he paid over half a million of francs. It is commonly supposed that Chenonceaux was erected by Francis I. for the Duchesse d'Etampes. But the king purchased the place from the heirs of Bohier, a chamberlain and financier. Part dates from 1515. Francis I. intended to use the building as a hunting-lodge. When it became the property of Catherine de' Medicis, who exchanged the Château de Chaumont for Chenonceaux, it was enlarged, but the works of the various periods continue to be sufficiently distinguished, and we trust nothing will be done by M. Terry to remove the characteristics. Philibert de l'Orme was one of the architects employed on the buildings. Chenonceaux passed into the possession of the family of the Duc de Bourbon. In 1733 it was purchased by Dupin, a farmer-general, and one of the conditions of the recent sale was that the tomb of a Madame Dupin, who died in 1790, and was buried in the park, should be respected by the purchaser.

There is probability about the interpretation of Holbein's so-called *Ambassadors* in the National Gallery which is put forth by Mr. C. L. Eastlake. All the previous speculations upon the identity of the figures and the oddly projected skull seem to be unsatisfactory. Mr. Eastlake says there were two men, named Richard Pate and Sir Hugh Askew, about the Court who might have sat to Holbein. Assuming that the two were friends, and like many of their contemporaries were of a humorous turn, there would be no offence against the rules of art then in vogue if a pate or skull were represented askew as a symbol of their unity as friends and as a sort of title for the work. This explanation of the skew-pate is the most reasonable that has been offered. After working out the theory, Mr. Eastlake says he discovered on the dagger of one figure, *ascu* or *asqu quod erat demonstrandum*, which is a further confirmation of his conclusion.

The third division, completing the first volume of Mr. Gotch's work on the Renaissance buildings of England, has appeared. The list of subscribers is evidence of the interest which the venture has excited, for it might be said that the number of names is unprecedented for a work on an architectural subject. In the third part the plates are illustrative of the halls of Kirby, Rushton, Dingley, Lilford, Blickling, Rothwell Market House, Lyveden, Hinchinbrooke, Audley End, Knole House, North Mymms and the porch at Elstow. The plates in style correspond with those in the preceding parts, and when completed there will be an uniformity of excellence which is not always obtainable when works are brought out in divisions.

Some time ago a competition was got up by the Union Centrale des Arts Décoratifs for designs that could be used in connection with electric lighting. French juries in such cases are fastidious, and not one of the designs submitted was considered to deserve a prize. There will, in consequence, be a second competition. It is possible to obtain handsome incandescent lamps and electroliers in Paris as in London, but the Union wished to have something that would not be suggestive of gaseliers. The difficulty of attaining novelty in the form of lamps is almost enough by itself to explain the slow progress of industrial art.

STATE MANUFACTORIES IN FRANCE.

IT is evident from several events which have taken place recently that the administration of the State manufactories in France is yearly becoming more difficult. At the Gobelins M. GALLAND, who was supposed to be the supreme authority on all things artistic in the establishment, has just resigned his office. He discovered that on the most important question, viz. the character of the works that were selected for production, he was not to be consulted. The director of the Department of Fine Arts could not understand M. GALLAND'S grievance, for too many officials are willing to possess sinecures. As became a gentleman who was a sort of compound of amateur, schoolmaster, Government clerk, journalist and busybody, with the defects of each, he sneered at M. GALLAND'S zeal, which to such a mind appeared to be an aping of the autocracy of LEBRUN. The Fine Art Minister, on the other hand, has the sense to perceive that M. GALLAND is right, and declines to accept the resignation. In what way the imbroglio is to end is unknown. At Sèvres it has been discovered that the establishment can no longer be ruled by one man, as in the old days, and it was necessary to appoint no less than three, who are to be independent of each other. It is hoped, however, that they will agree in order to keep the pottery going. There are also difficulties in dealing with the operatives of all the Government manufactories about wages. Investigations have taken place, and it would seem that arrangements are to be made by which the rewards which were established for the benefit of a few individuals are to be converted into a fund which will be available for a much larger number of the employés. It is needless to say the workpeople cannot be made to participate in profits, for there are no results of that kind; in fact, every article produced at the Gobelins, Beauvais and Sèvres abstracts more or less money from the people.

There can be no doubt that far larger sums are wasted than those required for upholding the State factories. But for all that economists are not agreed upon the necessity of losing money on tapestry and porcelain. There was a time when the competition of the factories was advantageous, for the standard of production throughout France was raised in that way. They were also schools for the education of a superior class of designers and workmen. But the condition of trade has changed, and it is with difficulty that Sèvres and the Gobelins can now compete with ordinary works in sending out porcelain and tapestry. When it is seen that the directors of the Government factories are not selected from the official staff but are invited from outside, it becomes evident that excellence of all kinds is attainable in trade.

It cannot be denied, however, that establishments which are supported by the State can occasionally be advantageous. A long course of investigations like CHEVREUIL'S at the Gobelins could hardly be undertaken in a private laboratory, and few manufacturers would care to wait for years without results from the money expended. The search after kaolin in France, which has immortalised MACQUER, one of the chemists at Sèvres, would probably have turned out a failure in the eighteenth century, if he did not go about as a sort of Government official. The sacrifices which BRONGNIART made of his own interests during almost half a century at Sèvres, and by which so many improvements in the processes were realised, would not be accomplished if he were not assured that he was serving his country in a national institution. As regards the relation between the factories and art, it must be said that many judges are in favour of them as aids to improvement. Dr. WAAGEN, who could not be considered as carried away by admiration of anything French, said that a most beneficial influence on a variety of trades and handicrafts was exercised by the Gobelins and Sèvres factories. It must also be acknowledged that the work executed in them was often superior to what was obtainable outside, and in that way the French people were taught to appreciate the best work of industrial artists.

The factories were not, however, established with a view to the benefit of French manufactures, although there were some declarations to that effect. When the weaving of tapestry and hangings was commenced at Fontainebleau, it was owing to the desire of FRANCIS I. to secure the realisation of the designs of PRIMATICCIO, and to have a finer sort of decoration in his palace than was derived by his nobles from Flanders or Italy. The death of the king, and the troubles that followed, put an end to so royal a hobby. When HENRI IV. was desirous to revive it he was opposed by his chief Minister, SULLY, who considered that the money required could be expended more wisely. But the king would have his way, and a company of weavers were installed in the Louvre. They were evidently masters of the craft, for a couple of hundred Flemings were imported to assist them. LOUIS XIII., who came next, may be considered as the chief supporter, if not the founder, of the rival factory, the Savonnerie. During the minority of LOUIS XIV. the tapestry weavers were unable to obtain royal bounties, and their trade could not exist without them. But as soon as the king began to exercise his rights over his subjects' wealth, tapestry was patronised as if it were indispensable for the monarch's pleasure, if not for good government. The dyeing-shed which GILES GOBELINS and his family used alongside the Bièvre stream, which was supposed to be endowed with special qualities for mixing with dyes, was acquired, and became the "Manufacture royale des meubles de la Couronne," although afterwards only tapestry came from it. The factory was intended to be, as the title shows, as much of a royal institution as the kitchens or stables. The artists and artisans of the Gobelins were the king's servants, for at that time in France it was not considered necessary that the revenues received from the people were to return to them through new modes of distribution. The king said he bought the property with his own money. It seemed as if all things needed by LOUIS XIV. must be produced by privileged hands. The Gobelins by itself was unable to meet the royal requirements. In addition the Savonnerie was re-established. Beauvais was founded, and subsidised aid was also promised to Aubusson and Felletin, as supplemental works, which were not, however, required. With an artist like LEBRUN, who seemed destined by nature to be a sort of pictorial historiographer, the employment of the weavers was unlimited. Many other trades went on at the same time under his direction, but somehow the weavers alone were able to hold on by the Gobelins during the vicissitudes which were the products of the king's ambition. Under the two monarchs who followed LOUIS XIV. the fortunes of the factory varied according to the state of the treasury. As the power of the Government declined there was less discipline among the officials, and the Gobelins resembled many of the public departments by its dissensions.

When LOUIS XIV. resolved to establish the looms and produce the costliest *haute lisse*, he announced that he was solely inspired by a desire to benefit his subjects. Tapestry-weaving, it was said, always brought great profit to a State, and it was the king's desire also to make use of such means to help commerce. The people do not appear to have accepted so remarkable a theory in economics. When the Revolution broke out a jury, some of the members being artists, and others being officials in the factories, made inquiry into the productions, and the completion of all that were obnoxious was suspended. The drawing-school was closed, and few weavers were allowed to remain. An appeal was made by them, in which they say that for four months' work they received five days' wages, that they were without food, clothes or credit. But as the armies that were defying Europe at the time were in a similar condition, there was little sympathy for the tapestry-workers.

NAPOLEON, who was desirous to adopt kingly ways, resolved that tapestry should once more be employed for the adornment of his palaces. The weavers were again set to work, and able chemists were placed in charge of the dyeing. The kings who came afterwards were true to the Gobelins, and it was liberally supported by NAPOLEON III. Tapestry was an acceptable present to the rulers of other countries, and a good deal was produced for that purpose, but there is an incredible quantity stowed away in the garrets and cellars of national establishments, as if through fear that if too much were visible the value of the productions of the Gobelins and Beauvais looms would fall.

Under the Republic the Gobelins is tolerated, for even a weaving shed can have some use in politics. A picture that is not suitable for a public gallery may, at the desire

of a supporter in the Chamber, be turned over to the weavers. An artist with a strong sense of decorative fitness may be scandalised, but there are sure to be high officials who can snub all who are unable to conceal their regard for theories that are not in accordance with governmental ideas. It must also be said that noble works are not ignored by the French Government. At the present time there are three designs by M. GALLAND in the hands of the weavers. There are also on the eve of completion works by M. EHRMANN, whose *Literature, Science and Art of Antiquity* was the representative example of the factory in the International Exhibition of 1889; by M. MERSON and M. FRANÇOIS, the landscapist. A series of ten pieces illustrative of the drama has been commissioned for the Comédie-Française, and there is one in preparation for the Odéon. So many works are evidence that, in spite of the opposition to the principle of national establishments, the art of tapestry-weaving is not neglected. And it should be borne in mind that the pieces cannot be longer used to gain credit for any one of the rulers. On that account there is a possibility that idealism may at least find some recognition in the Gobelins. Typical figures like M. EHRMANN's are best adapted for reproduction.

The factory at Sèvres cannot be considered to be connected with royalty in the same way as the Gobelins and Savonnerie. It was created at a time when kings were not above deriving a revenue from their establishments. In 1745 a company was formed to manufacture porcelain. LOUIS XV. had already contributed about 400*l.* towards the experiments, and he subscribed afterwards 100,000 livres out of the 250,000 livres (9,875*l.*) which formed the capital. The works were then at Vincennes. The first production was a vase which was considered to be equal in quality to the porcelain of Miessen. There was much progress, and not only the king but Madame DE POMPADOUR took the greatest interest in the venture. In order to preserve a monopoly, it was decreed that any manufacturer who employed a workman from the royal factory was to be fined 3,000 livres. In 1753 the company was reconstituted, the king took one-third of the shares, it was agreed that the secrets were to be his property, and his monogram was to be on all the pieces that were manufactured. In 1756 the works were transferred to Sèvres. The sales in the next year amounted to 210,000 livres, and continued to increase. The shareholders were, however, discontented, and in order to put a stop to the complaints, the king paid back the sums they subscribed, and thus became the sole proprietor. A few years afterwards the manufacture of hard porcelain was undertaken, and was no less successfully produced, and at the death of the "Bien-Aimé" in 1774 the merit of the Sèvres vases was appreciated in all the courts of Europe.

LOUIS XVI. might have conducted a locksmith's shop, but he was unable to control so important an establishment as the royal pottery. The secrets which were so closely guarded in the preceding reign were divulged, competitors arose and the debts on the works increased. Some of his royalist friends tried to prevail with the king to rid himself of so embarrassing a property, but LOUIS was stubborn, and insisted on its retention, and he promised to pay all expenses out of his own income. He was not long able to try reforms. Under the Republic there was more respect shown for Sèvres than for the Gobelins. But as the Government were without money to continue operations, the good intentions were fruitless. However, in 1800, when BRONGNIART became director, there was a change. He abandoned the manufacture of the soft porcelain, and concentrated all the skill he could secure on work in the hard material. After forty-seven years of most loyal service, BRONGNIART died, and since he passed away there have been able directors. But the manufactory continued to be attached to the king or the emperor, and the pieces bore the monogram of the ruler. At the present time the mark is that of the Republic.

According to M. JULES SIMON, the State should labour to render itself useless, and pave the way for its resignation. The words are applicable to manufactories like those of Sèvres and the Gobelins. The State in respect of them is useless. They are relics of a different sort of Government, and if they are to be preserved it is not necessary to make an elected authority responsible for their success.

ARCHÆOLOGY IN IRELAND.

THE following presidential address was delivered by Dr. Reeves, Bishop of Down and Connor, at the annual meeting of the members of the Royal Irish Academy:—

Our Society commenced its existence on April 18, 1785, and its incorporation was established by Royal Charter on January 28, 1786, nearly fifteen years in advance of the Act of Union, and its constitution is of such a comprehensive and varied nature that it has lived through many trials and survived many dangers, uninfluenced in its growth and efficiency by the elements of discord which often prevailed outside, and guaranteed in permanence by the triple provision of its charter, as expressed in its preamble—"Whereas several of our loving subjects of our city of Dublin and kingdom of Ireland have lately met together for their mutual improvement in the studies of science, polite literature and antiquities; and whereas we are willing to give encouragement to studies of that nature in all parts of our dominions, and more especially in our said kingdom of Ireland, which was in ancient times famous for its schools and seminaries of learning, and hath since produced many persons eminent in every branch of science, and are desirous that useful, curious and polite literature should, under our royal patronage and special protection, continue to flourish and increase." Circumstanced as our poor and backward country has been, no one of these departments of pursuit would have been sufficiently well sustained by members' endowments or zeal to keep up of itself with the course of time, and enjoy a vitality which depended on the interest taken in its proceedings. But in the combination of subjects and pursuits emulation was quickened and co-operation enlisted, and a stability was secured, which, failing one, another was presented, and three agencies from a common centre fulfilled the promise of the Manx achievement—"Quocunque jeceris stabit." To our threefold constitution, not tripartite, but *tria juncta in uno*, we owe the health, prosperity and vitality of our Society England can afford to have a Royal Society for the development of science, a Society of Antiquaries for archæological pursuits, and Society of Polite Literature in its various forms, and history in particular. Scotland also has a Royal Society in Edinburgh, and its Society of Antiquaries, and all in active and useful operation. Here the forces are combined, and the three elements have, by an early very distinguished president, been represented as the impersonation of the three principles—the true, the beautiful and the old. Another, some steps later, following the lead of Lord Bacon, applies the threefold distribution of human knowledge derived from the ancient division of the intellectual faculties of man—memory, imagination and reason. Reason furnishing the knowledge of mathematical and physical science; imagination, including belles-lettres, poetry and fiction; memory, embracing history and archæology. This was so as perfectly applicable in 1856 to our three subjects, and our three committees of seven each. But it has since been found that the employment of these committees was inconvenient and inadequate, in consequence of which the functions of science in its enormous range were continued to one committee of eleven members, and polite literature associated with antiquities to another of ten members.

The former embraces a vast number and variety of subjects much more remote from each other than are polite literature and antiquities; and considering that imagination of one president and fiction of another belonged to polite literature, the experience of this Academy during the first half of its existence bears ample testimony to the exercise of imagination in dealing with such subjects as the round towers, the earthen raths, the cromlechs, the gold cup fibulæ, also of fiction, invading antiquities in the departments of fire-worship, Baals, Belus, the identity of Irish and Punic languages, the aid of Irish in the interpretation of Etruscan inscriptions, and the close affinity of Gaelic and Hebrew. An infinity of such ravings so fascinated the speculative tendencies of those undisciplined by learning, observation or common sense, that it has required half a century to dismantle, if not break down, the rude mental structure of Irish antiquities, which too often employed ignorance as stone and imagination as mortar. While Kirwan and Brinkley were labouring to rectify or enlarge the field of science, a leading member was leading his followers into the most extravagant excesses, with only three redeeming acts of his career, namely, bringing about the presentation of the Book of Ballymote by the Chevalier O'Gorman—the very first gift to the infant Academy; the second the purchase of the Lebor Brec for three pounds, and his apology to the Academy when the book was laid on the table for his recklessness in paying so large a sum—like Malone, who apologised in a letter to Lord Charlemont for his daring extravagance in paying 14*l.* for a first Shakespeare. The third was his collection in Hibernica, a miscellaneous collection of pieces, chiefly done by good scholars, and some by himself, with full swing in his Oriental absurdities. Yet this series, suited to the day, brought him under the notice of Edmund Burke, who regarded the editor's enthusiasm with

great respect, and, inspired by it, induced Sir John Sebright to present to Trinity College the Irish portion of Edward Lhuyd's manuscript, which he had purchased (along with his great Cambrian collection), and this magnificent gift is there, and pre-eminent among its contents is the Book of Leinster—a wonderful bibliotheca of precious contents, upon which, at the instance of this Academy, Trinity College made joint cause with us, and not only lent the MS. for transcription, but defrayed half the expense of the impression, being, I believe, a hundred copies for each, whereby the college, for European donations, and ourselves, to supply the wants of home, provided at cost price. This was a joint procedure between ourselves and another body, which has been productive of the best results. It was thus that the Academy went hand in hand with Mr. George Smith, the publisher and bookseller, and, by its quota of subvention, to secure a sufficiency for the purpose of members, meeting the produce of the public markets, a most expensive work was secured for members at a very moderate cost to the Academy. And so it probably may be by-and-by as regards the Book of Armagh.

"No one science is so little connected with the rest as not to afford many principles whose use may extend considerably beyond the science to which they primarily belong, and that no proposition is so purely theoretical as to be totally incapable of being applied to practical purposes." Substituting "knowledge" for "science," we have abundant examples to show how the handmaids of knowledge can readily aid one another in the discharge of ordinary duty. In the first instance I appeal to the Ordnance Survey of Ireland, which in its results has conferred so many benefits directly and indirectly on our country, and among them the purification of the Academy traditions and the infusion of fresh energy into its constitution. It gave an impulse to patient investigation and inductive conclusions, and it fitted for after life a body of men who, trained in the strictest discipline of mental investigation and exactness, were prepared, when their temporary engagement was concluded, to be the missionaries of sound reasoning and dispassionate judgment in the application of the arts and sciences. It was in this school that Petrie found encouragement and O'Donovan employment. Animation was infused into all that were engaged in the work, and everything was tested by the rules of truth and accuracy. It is now more than sixty-three years since the Ordnance Survey of Ireland was commenced, and whether we regard the immediate undertaking or the impulse which it gave to accurate investigation, we may safely say that no country in Europe has received during the same period so valuable an accession to its internal literature. The landlord, the clergyman, the magistrate have alike availed themselves of the maps; grand juries, poor-law unions, and government of forces have, with equal reliance, had recourse to them for guidance in their several departments, while even the surveyor who is possessed of a pentagraph can now, at his table, more faithfully execute his work than formerly he could have done in the field. As an ecclesiastical record the Ordnance maps are an inestimable source of information. The clergyman who desires to become familiar with the geography of his parish has here an unerring guide; the ecclesiastical antiquary who seeks for information about distant churches here finds an index to all places of religious note, and, whether to define a rural deanery or to delineate a diocese, here are the materials ready at hand, for reduction or enlargement at the pleasure of the employer. But independently of these experiences, the Ordnance Survey was of incalculable benefit to this country. It fostered and developed a great amount of native genius, which but for it might have slumbered and at length have expired unemployed and unknown. The obvious desirableness of establishing a correct standard for the spelling of names so difficult and arbitrary as those of Irish topography suggested the propriety of calling in the assistance of Irish scholars, and the wish to aid the process with illustration from literary sources secured, in addition, the services of our most eminent antiquary. Thus it happened that while the Survey Department, under the admirable direction of Colonel Colby and Captain Larcom, was conducted with unrivalled diligence, the collateral undertaking called into exercise the talents of O'Donovan, Curry and Petrie, a literary trio which would have done honour to any country. In this manner was the foundation laid for a new school of Irish antiquaries, which, disregarding the visionary theories and the wild ravings of the preceding age, preferred fact to hypothesis, demonstration to conjecture, and induction to speculation, so that we might, borrowing the title as they have done the patient precision of their fellow-workers, style them the Ordnance Survey School of Irish Antiquaries, taught, furnished and adopted by this Academy, contrasting them with the visionary leaders who had their day of ignorant dictation, only to gain for themselves a temporary notoriety at the expense of Irish philology and legitimate investigation.

The other case where one branch of knowledge ministered to another in producing a happy result was in a matter which occurred inside this Academy. The late Dr. Todd, F.T.C.D., who from 1846 to 1856 was secretary, and from 1856 to 1861 president of the Society, having learned from Irish history by the statement of a writer who was either himself an eye-witness of the battle of Clontarf or else recorded the testimony of an eye-witness, that on the day of the battle, namely, April 23, 1014, the full tide in Dublin Bay coincided with sunrise, and that the returning tide at evening aided considerably in the defeat of the enemy, being desirous to test the truth of this statement, and thus form a fair opinion of the writer's accuracy, proposed to the Rev. Samuel Haughton, the Junior Fellow and Professor in Trinity College, this simple question, "What was the hour of high water on the shore of Clontarf, in Dublin Bay, on April 23, 1014?" without disclosing the object he had in view in the question. Whereupon Dr. Haughton kindly made the desired calculations, requiring considerable knowledge and skill as well as labour, and having done so communicated the result to our Academy on May 18, 1861, the present Bishop of Limerick being in the chair and myself at hand as secretary. Dr. Haughton, as reported, furnished a brief report of the calculation and of its result, adding, "The result confirms in a remarkable manner the account of the battle and with which I was unacquainted previous to making known to Dr. Todd the solution I had arrived at. I believe that in consequence of the exact information obtained by the Academy in 1851 of the Irish tides that I am able to guarantee the truth of my calculation of the time of high water within a few minutes. The tide was a neap tide, and the moon in her third quarter. From the Academy's observations it appears that on such a day of the moon's age, at the spring equinox, the tide at Kingstown was in full at 5 hours 22 minutes in the morning, from which it follows that the tide along the Clontarf shore, when not obstructed, could not have differed many minutes on April 23, 1014, from 5 hours 30 minutes A.M., the evening tide being full in at 5 hours 55 minutes P.M." Here was science coming to the relief of compartments 2 and 3. It is known to all chroniclers how wonderfully full and accurate the second edition of "L'Art de Vérifier les Dates des Faits Historiques," as compiled by Dom Clement anonymously for the honour of his Order, in which, so long as books or manuscripts were the field for examination, he was perfect master of his subject, while in matters of science, and especially mathematics, the Order possessed no adept, and therefore, aware how important it would be to have the "Chronologie des Eclipses," he succeeded in enlisting the services of an accomplished astronomer, M. Pingre, Canon Regular of the Congregation of France, who accordingly compiled a table of eclipses from A.D. 1 to 1900, which was reported by Le Monnier and d'Alembert to be well worthy of the Academy's approval and printing twenty years before the founding of our Academy. Here, then, is a work of pure science called into the elucidation and satisfaction of history and affording an unerring tribunal to judge between conflicting claims and to correct erroneous statements. It happens that Venerable Bede, when recording the ravages of the great pestilence of 664, in more than one place observes that that year there was an eclipse of the sun on May 3, tenth hour of the day. On the other hand, our annals of Tighernach and of Ulster at the same year ascribe the eclipse to May 1 at the ninth hour, for ordinary historical purposes a microscopic variation, but to an astronomer a vital one. Science now must be the umpire and award the benefit of the decision. So Pengre's Table is called in, consulted, and there we find eclipse of the sun May 1 at three. Unfortunately the 4th must follow Bede. In two of these instances the authorities are detached, but here we have, in our triple constitution, ample resources for indoor decisions in rival claims and ample supplies of supplementary assistance. Before the fusing of the two committees the Antiquity Committee was occasionally exposed to a sneer which would not spare even Jonathan Oldbuck. The consolidation of the committee now gives weight to each :—

> Ephraim non æmulabitur Judam; et
> Judas non pugnabit contra Ephraim.

Who would refuse to Champollion, or Goolefen, or Rawlinson, or our own Hincks, though technically classed in the section of antiquities, a high place in science, deservedly earned by the noblest faculties and exercises of the human mind?

In fine our Academy is a school to encourage not repress knowledge, industry and research; and though we have such names on the roll of mathematical fame as Brinkley, M'Cullagh, Hamilton and Salmon, there is full appreciation of those other eminent members who are in their several departments employed in increasing and refining knowledge without any disparagement. A Laplace is not to make little of a Bowditch—intellectual tyranny or dictatorship is here forbidden—"Urit enim fulgore suo qui prægravat artes infra se positas." The Academy welcomes and honours every man who according to his ability labours to enlighten others, either in the gratification of his own taste or in benevolence to his fellow-creatures: it is only where conceit accompanies ignorance, or error is systematically upheld, that the voice of authority has here any field for censure. In science the Irish are as apt and able as any people; in polite literature also they have the great advantage

of a temperament which is friendly to the impulse of imagination ; but in antiquities the "perfervidum ingenium Scotorum" is liable to excesses in theory, and shrinks from the tedium of cool judgment. Zeuss administers a wholesome caution to such, where he says, "Velim Hiberni nativi ipsi his enucleandis operam dent, sed cautim, sensim, rem non obiter peragentes et modo interpretandi nimium promto," and he said it justly, even as regarded his own endeavours, for in the very next page, where he renders in satire the ancient Irish poem, the "Cris Finnain"—Finnain's Girdle—there was a Hibernus nativus whose vernacular Irish, coupled with the knowledge of its archaic forms and vocabulary, enabled him to correct the halting interpretation of the learned German. At the siege of Flushing the Irish artillery fired three shots for every one of the English corps, with not half the execution. And coupled with this impetuosity of haste, a disposition to jump at conclusions, or accept suggestions without consideration, I would say to the impatient—take time. "Quod non affert hora, plerumque præstat mora." What were the views of Mr. Burke, and what his expectations from the University and the Society of Antiquaries will best appear from his letter of August 15, 1783, addressed to General Vallancey. In this he says :—"I shall tell you what a judicious antiquary about twenty years ago told me concerning the chronicles, in verse or prose, upon which the Irish histories and the description of antiquaries are founded, that he wondered that the learned of Ireland had never printed the originals of those pieces, with literal translations into Latin or English, by which they might become proper subjects of criticism, and by comparison with others. . . . If I were to give an opinion to the Society of Antiquaries I would propose that they should be printed in two columns, one Irish and the other Latin, like the Saxon Chronicle, which is a very valuable monument, and above all things, that the translation should be exact and literal. It was in the hope that some such thing should be done that I originally prevailed on Sir John Sebright to let me have his MSS., and that I sent them by Dr. Leland to Dublin."—(Edw. O'Reilly's "Translations of the Iberno-Celtic Society for 1820," pp. ii. iii.)

As regards the ancient literature of Ireland, I deem it a privilege that there are now within the compass of this city a larger and richer collection of Irish manuscripts than ever have been assembled there since the Conquest. First and most considerable is the Irish group in Trinity College, the gatherings of Ussher, Lhuyd and other benefactors. Secondly, that of our Academy, which nearly approaches the former in number and importance, the gatherings of a century and the donations of a few benefactors, but chiefly obtained by purchase. To these are to be added the Government deposits of the Irish portion of the Howe manuscripts, collected by the two O'Conors, and of extreme value. Thirdly, the St. Isidore's collection from Rome, at the Franciscan House on Merchant's Quay. Fourthly, Primate Marsh's Library, where there are a few good Irish manuscripts. Between these various depositories there exists a very friendly disposition to further the common cause of the practical development of their literary materials. In this cause the Academy has taken the initiative with great heartiness and success in its publication of Irish Texts. During the last twenty years it has published in admirable facsimile—First, the Clonmacnoise MS. of 1106, known as the Leber nah Uidhre, containing 134 pages and preface, 1870, copied by Joseph O'Longan. Second, the Leber Brec, an inestimable MS., obtained by the Academy in 1789, large folio of 131 leaves, exquisitely copied by the same scribe with wonderful fidelity. 3. The Book of Leinster, belonging to Trinity College, but entrusted for transcription to the Academy, and half the expense of publication borne by the owner, 411 pages of text, with a very learned introduction by Professor Atkinson of 90 pages. This was copied by the same scribe, and is a marvellous evidence of his skill. Published in 1880. 4. The Book of Ballymote, an Academy MS., by photography. A noble manuscript, as true and as easily read as the original. The text, 502 pages and preface of 22 pages, by the same editor. 5. The Yellow Book of Leacan, in process of being photographed. 215 pages printed off, and 40 more ready for printing, are reported in the minutes of the stated meeting in March. While on this subject of reproduction, I may be allowed briefly to advert to the work of the most famous Irish scribes of modern times. The first of this class is Michael O'Clery, whose beautiful writing, so free and elegant, is specially observable in two MSS. of the Academy. The autograph Annals of the Four Masters, of which the first portion is preserved in the Stowe contingent and the second in the Academy collection. The most beautiful handwriting is that of Professor Eugene O'Curry. There is an abundance of his work to be seen in the Brehon Law Transcripts and elsewhere, but more especially in the magnificent folio, his transcript of the Book of Leacan in the Academy collection, made for and preserved in Trinity College. The treasure in the Government building, was collected, formed, arranged and described by the Academy that was, under Government, invested with the charge of the best remains of Irish art and veneration, and under privileges conferred by Government, it had to a great degree attained to its present dimensions. The gifts and trusts, for the public convenience, were voluntarily handed over by the Academy, reserving to the Academy the privilege of its management, and the appointment of its curator. The transfer of the Royal Irish Academy's Museum, *servato nomine*, to the new depository was a wise and useful arrangement. There the Academy's function of promoting antiquarian knowledge through the medium of the eye, rather than the ear, will fulfil the poet's estimate of visual impressions :—

> Segnius irritant animos demissa per aurem,
> Quam quæ sunt oculis subjecta fidelibus, et quæ
> Ipse sibi tradit spectator.

By the removal of our museum to the National Repository in Kildare Street the Academy lost last October a great attraction and outward sign of its antiquarian commission. Its galleries and strong room were the depository of a collection, in some portion of it, not to be matched in Europe. But it was hampered and crowded and ill-accommodated, so that its removal was a great gain to its own credit as well as the convenience of the public, in its present ample disposition. Further, a large portion was either directly or indirectly the gift of the Government, and to some extent at its absolute disposal, and the wishes of the Government were too explicit and express to admit of any parley, so that on calm consideration the Academy came to the conclusion that on certain conditions the museum in its entirety should form a prominent feature in the grand display. Members lost hereby the ready opportunity of having original articles at hand to illustrate the subjects of certain communications, or direct the attention of a visitor to a place in the room above. The rapid growth of the library had begun to demand more accommodation for books, and the retirement of the museum afforded the required space. This is an opportunity to make it known and understood that the Museum possesses a copy of Friar O'Mellan's "Irish Journal of the Rebellion of 1641." It is a faithful copy of the original, which is in my possession, and the copy, a *chef d'œuvre* of penmanship, belongs to the Academy. John O'Donovan also wrote a very neat and graceful hand. A great deal of his work is to be found in the series of Brehon Law reproductions. But of all the scribes none did so much work and so constantly as Joseph O'Longan, who was the Academy scribe for years. He was an excellent Irish scholar, and his power of imitation in the various features of different manuscripts was only equalled by his fidelity. The three great facsimiles above-mentioned are evidences of his wonderful application and perseverance ; steadily he held on with his work in all weathers and under all circumstances, and his performances will ever remain to his great credit and the honour of the Academy. By means of these works, copies of which have been widely distributed among the learned of Europe, students of the ancient Irish will have the most abundant materials and the richest texts. It is impossible to over-estimate the importance of this portion of the Academy's work.

The Lord-Lieutenant moved the vote of thanks to the President for his address.

TESSERÆ.

Terra-cotta in Building.

THE artists of the Roman period made free use of clay, wherever it came to hand more readily than stone. They learnt not only to use it in regular layers of brick, as we do, but to mould it to all the elegances of ornamental form, all the details of rich architraves, capitals, friezes and engaged forms of sculpture. In some cases, as in the Amphitheatrum Castreuse and the temple of the god Rediculus, the material was wrought into form by the chisel. In modern Rome, as Hope pointed out in his "History of Architecture," very great use was made of brick until a period comparatively recent. Of the grand Farnese Palace began by Bramante and finished by Michel Angelo the plain surfaces are of brick, though so exquisitely laid and of a texture so delicate as to be taken by the superficial observer for stone. On this side of the Alps clay has never been moulded into forms to rival those of Italy. Still, in the South of France, particularly at Toulouse, remarkable examples are to be seen. In the valley of the Elbe, where the same deficiency of stone compelled a resort to the use of brick, there was never any approach to the refined ingenuity of Northern Italy. At Lübeck, however, the cathedral and the church of St. Mary are respectable specimens of the style. In the Marien Kirche, at Brandenburg, ornamentation is carried to excess. Hanover and other towns furnish picturesque examples, some of which may be seen in Mr. Fergusson's "History of Architecture." England at one time possessed a brick architecture of no mean merit. If less inventive in form or less rich in ornamentation than foreign models, it was at least simple, natural and eminently fitted to the climate. Many a fine specimen of the old English grange,

or of the more stately mansion of the Tudor and Stuart periods, still perpetuates a native type of architecture singularly suggestive of comfort. To the high fiscal duty and its ensuing restrictions is mainly due the degradation of brick in more recent time. The villanous imposture of stucco, aided by the contract system of building, completed the ruin of the style. The legal English brick became at once the least desirable and the most unsightly material that any country could show—the type of all that was bare, mean, ugly and false. It was especially in the plains of Lombardy, where building stone is rare, that the great impulse was naturally given to the use of natural earths for building purposes. There, in edifices of the highest architectural importance, we find clay during a long period not only used for the purpose of solid construction, but also moulded into forms so exquisite as to take its place as a material of high value and dignity in art. So rich is Lombardy in early works of terra-cotta as to be fitly called by Hope "the great country of brick." Among the most ancient remains of the kind, M. Ottolini calls attention to the crypts of the church of Lenno, on the Lake of Como. There sundry relics are still extant of colossal statues in terra-cotta "of a close-grained and tough consistency," all of which the writer considers clearly to belong to the constructions of Christianity. The use of terra-cotta followed the fortunes of successive schools of art in Italy. Both in sacred and secular architecture it enables us to trace the development of taste. The golden period of the art was marked by a wise sobriety and simple severity of ornament, with a scrupulous care to confine the material within its appropriate limits of style. In the hands of the gifted architects who flourished along with Lucca della Robbia, the pre-eminent modeller in terra-cotta, ceramic ornament entered into all that was purest and most noble in the arts of design. Crema, Chiaravelle and, above all, Pavia were the headquarters of this graceful school. At Milan, in the Ospitale Maggiore and the Castiglione Palace, were exhibited the arabesques and medallions of the cinque-cento period. In the subsequent age, in the hands of the so-called imitators of Michel Angelo, art, overpassing the boundary line of truth, lapsed into exaggeration. The severe, modest and delicate beauty of terra-cotta refusing to lend itself to the contortions and imitative tricks of the barocco or rococo style, the entire art soon fell into decay and eventual oblivion.

Thorvaldsen the Sculptor.

Like most of the great officially recognised celebrities in modern art Thorvaldsen tied his little boat behind the good old ship the Antique, and was towed triumphantly into port. There was a time—and this sculptor had the good luck to establish himself in Rome exactly at that time—when the princes and great people in Europe were much interested in antique art. They were not very particular about the quality of it; they felt about antique art generally a readiness to accept anything it had to offer, something like the disposition of many country clergymen in regard to Gothic who have a reverence for pointed arches and old tracery generally, and have not yet acquired the audacity to discriminate between the good and bad art of the Middle Ages. Thorvaldsen fell in with the humour of the time and produced works which entirely satisfied his patrons. They all seem to have been perfectly delighted with him except with his tardiness in the delivery of work commissioned. He would accept any quantity of commissions and establish any number of studios, where he kept a staff of workmen constantly employed in copying his clay models. He understood the art of economising his own labour and worked but little in marble, retouching the statues made by his workmen but not carving much himself. His view of the art of the sculptor was that unfortunately too prevalent in modern times, that it consisted in making clay models. Even in the clay itself Thorvaldsen found means of availing himself of the labours of others. He often sketched the subject roughly in clay, then entrusted it to one of his subordinates to work up to a semi-finish and retouched finally himself. The quantity of work he left behind him would seem inexplicably large if these facts were not taken into consideration. It must also be remembered that his life was exceptionally long and laborious.

Deviations among Copies of Ancient Statues.

The repetition of the well-known satyr of Praxiteles, known in ancient times by the distinctive appellation of "the famous," in the Braccio Nuovo of the Vatican, surpasses in the extremely delicate and life-like treatment of the nude portions, particularly of the upper part of the body and arms, even the Capitoline statue, usually considered the best specimen among the numerous copies of this figure. Although it may seem rash to attempt to come to any conclusion, founded on the artistic excellence of this work, as to the style in which the original of Praxiteles was itself executed, we may yet infer from it that endeavour to vie with nature in a certain direction into which the copyist has been impelled by his prototype. With repliques of the celebrated masterpieces of antiquity, the case must have been much the same as with those of Raphael in our own day, when copies of his pictures exhibit much more the excellences and peculiarities of the school to which the artist belongs, and of his own gifts, than the immediate beauties of the original. Even the prevalent feeling, in a reproduction thus given in a creative spirit, must chiefly be regarded as the reflection of the frame of mind of the copyist himself. Hence it becomes the business of the historian of art, by an analytical process of no small difficulty, to establish those elements which constitute the essence of the original work in question. Science has, however, still far to travel before reaching this point, and so long as the archæologist does not endeavour to cultivate his eye methodically, and learn to direct his attention to the essential, no aid is to be expected from this quarter for enabling us to comprehend the artistic historic significance of works that have come down to us at second and third hand. Were any one really desirous of arriving at a scientific result by such a comparison of the peculiarities of style to be met with in the separate repetitions of the same original, a collection of casts, if not of the whole work, at least of the most important parts, would be indispensable. But where, in our days, is the director of a museum to be found who would willingly even take charge of so costly an apparatus? Would not that show-room harmony, usually much more aimed at than genuine instruction in the formation of such collections, be disturbed in the most displeasing manner by so lavish a display of these *disjecta membra poetæ*. And yet the most surprising results of a not merely theoretical, but really practical, benefit might be expected from an experiment having no other object than to bring together all that still remains to us, in scattered fragments, of the most celebrated antiques. We should thus get rid of whole loads of learned archæological lumber, and, at the same time, gain a solid foundation for a science the possible existence of which is, with most persons, a matter of doubt. Our object in all this is to direct the attention of the lover of art to the advantage to be derived, for example, from a comparison of the plastic formations we possess in the numerous copies of the Faun of Praxiteles. With the help of such a collection we should be able in the course of a month to diffuse more correct notions of art than can at present be gained during the academical triennium. In the present state of archæological science, we must not be surprised if it is in danger of falling altogether into disrepute, as those who stand pledged to further its interest seem to conspire only for its ruin.

The Cathedral of Moscow.

It appears to have been usual, when the construction of a building of importance was contemplated in Russia, to apply at Constantinople for experienced architects, to whose skill the undertaking might be committed. When Moscow was in want of a cathedral, however, in 1473, the Greek Empire had ceased to exist; and the Russians, unaccustomed to look to any other foreign quarter for assistance in their architectural concerns, determined to confide the execution of the work to the less trustworthy hands of native artists. The foundation was accordingly laid in the presence of the Court and clergy; and the progress of the building at first seemed to promise the most successful results. Already had the walls of the church attained to their intended height, and nothing was wanted but to close in the arches, which were destined to constitute the roof, when, unfortunately, this critical *labor ultimus* proved more than the mastership of the Muscovites could manage, and like the finishing card of a nursery castle, precipitated in a moment the whole building to the ground. This disappointment, however, though it discouraged for a time the development of national ingenuity, was by no means so unfavourable, as might have been expected, to the propagation of architecture in Russia, since it led to the employment of Italian artists and the consequent magnificence of the Kremlin. Ivan III., at that time Grand Duke, resolved to despatch an embassy to the republic of Venice, of which an essential and the principal object was to procure at any price a good architect. The artist engaged by the ambassador was Alberti Aristoteli, a native of Bologna, a man of considerable reputation in his own country, and who had even been invited by Mahomet II. to superintend his alterations at Constantinople. It was probably for the purpose of making himself master of the necessary distribution of a Greek church (with which, as a Latin, he may be presumed to have been previously unacquainted) that Aristoteli made it his business on arriving in Russia to visit the ancient cathedral at Vladimir, which, though sacked and ruined by the Tartars, was still considered by the Russians as a *chef-d'œuvre* of art. Returning to Moscow he proceeded to lay the foundations of the present cathedral, which was begun in 1475, and being brought without accident to a happy completion, was consecrated by the Metropolitan on August 12, 1479. Though the work of an Italian, it must not be supposed that this church has any great similarity to those of Italy. Some, indeed, of the ornaments of the exterior are such as may possibly have been borrowed from churches of the Lombard style, but even these (perhaps from their comparative paucity) bear an infinitely more striking resemblance to the works of Saxons and Nor-

mans. The arch of the great southern door in particular is like those which are usual in all our more ancient churches; the windows, as in them, are narrow, round-headed loop-holes; and the range of small arches which runs round the building at a considerable height from the ground might even be mistaken for a Norman decoration. Notwithstanding the appearance, however, of a few of the details, the general character of the church is decidedly Græco-Russian. The Byzantine model, indeed, was probably prescribed to the artist, and accordingly, as at Novgorod, the ground-plan is nearly square, a small projection serves for the sanctuary, and the roof is supported by four large piers. The only essential improvement to be observed in this church, when compared with former architectural attempts in Russia, is the superiority of its general elevation, which allows a degree of loftiness to the interior before unknown. Upon the whole, however, it must be confessed that, as a work of so late an era as the fifteenth century and the great metropolitan temple of an (even at that time) considerable nation, this brick-built edifice is only calculated to excite astonishment from the primitive rudeness of its appearance, and in point of real architectural merit can never, with all its gilding, be brought to stand the slightest comparison with the contemporary structures of the west.

Roman Gardens.

The Tusculan villa of Cicero, though often mentioned, is not anywhere described in his works so as to afford an adequate idea of the style in which his grounds and gardens were laid out. There is little to be traced in Virgil. Pines were probably a favourite ornament, and flowers, especially roses, were highly esteemed. The Pæstan roses were chiefly valued for their excellent odour, perfumes, indeed, having been always highly valued in warm climates. There appears also to have prevailed among the Romans a piece of luxury which is equally prevalent with ourselves, namely, the forcing of flowers at seasons of the year not suited for their natural bloom, and roses were then the principal flowers upon which, as we gather from Martial, these experiments were made. Pliny tells us that the place of exercise which surrounded his Laurentine villa, used by him as a winter retreat, was bounded by a hedge of box, repaired, where necessary, by rosemary; that there was a vine-walk, and that most of the trees were fig and mulberry. Of his Tuscan villa the garden forms a considerable part of the description. And in that description what beauty is most lauded? Why, exactly that which was the admiration of this England of ours about 150 years since—box trees cut into various shapes, monsters, animals, letters and the name of master and artificer. Thus we see that in an age when architecture displayed its grandeur, when arose Vespasian's Amphitheatre, the Temple of Peace, Trajan's Forum, Domitian's Baths and Adrian's Villa, the ruins and vestiges of which still excite our astonishment, a Roman consul, a polished emperor's friend and a man of taste and literary attainments, delighted in what the English parvenu of to-day would scarcely deign to give a second glance at. All the circumstances of Pliny's summer garden correspond exactly with those formerly laid out on Dutch principles. He talks of slopes, terraces, a wilderness, shrubs methodically trimmed, a marble basin, pipes spouting water, a cascade falling into the basin, bay trees alternately planted with planes and a straight walk from whence issued others, parted off by hedges of box and apple trees, with busts and obelisks placed between them. There wants nothing but the fringe of a parterre to make a garden of the time of Trajan serve for a description of one in the reign of our third William.

Patina.

One of the most valued properties of fine bronze is that it should in process of time, by natural oxidation, become encrusted with a semi-crystalline varnish-like coating of beautiful tones of colours, which vary greatly in different specimens, according to the composition of the alloy and the conditions under which the surface of the metal has been exposed. Now, time, and time only, will induce the beautiful natural "patinas." They can, it is true, to a certain extent be simulated by artificial means, but the fine, natural encrustations have a peculiar texture, a lustre and depth of tone—in short, an æsthetic charm indescribable, which defies imitation. The artificial patinas are produced by the application of acids, by heat, and by surface lacquers and varnishes. It is, of course, very difficult for the uninitiated observer to discriminate betwixt the two kinds—in other words, betwixt the true and the false—and there is a further element of difficulty in the fact that artificial patinas were in use in former times as well as at present; but the great Italian bronzists were aware that any elaborately-concocted artificial patinas applied to their works, especially if in the nature of resinous lacquers, would interfere with the ultimate natural oxidation of the surface, and they evidently contented themselves at the time with the simplest possible colouration of the bright metal by the mere application of acidulous solutions. Sometimes, however, in the chances and changes of the centuries, it has happened that genuine ancient medals have fallen into the hands of tasteless or ignorant persons, who have cleaned and scrubbed them up, and the mischief has been afterwards remedied or concealed by the application of an artificial patina. Such examples are, of course, much deteriorated in value. As a rule, the fine original fifteenth and sixteenth-century specimens should have bright, lustrous and transparent natural patinas, varying in colour from a glowing golden tint through every shade of onyxlike brown to the darkest olive. For the most part the ancient surmoulages of Italian medals—that is to say, the copies produced in Italy during the sixteenth, seventeenth and eighteenth centuries—have had artificial patinas, usually resinous lacquers, applied at the period of their production, the intention being, of course, to simulate the aspect of the original types, which had already become patinated by time. But these spurious patinas have interfered with the natural oxidation of the medals, and the result is usually the formation of a heavy, loaded encrustation, black in colour, and of a patchy, irregular surface. The forgeries of Italian medals which are being produced at the present moment, on the other hand, are as a rule brighter in aspect, for the skilfully-imitated patinas have naturally as yet undergone no change. The best of these are likely to prove a more dangerous snare to the inexperienced collector than the ancient copies, inasmuch as these are in many cases, moreover, moulded from very fine original examples, and so are only one remove smaller in size. Constant observation and comparison of specimens will, of course, alone enable the medal-collector to steer clear of these impostures, and there will perhaps always be cases in which even the most skilful and experienced connoisseurs may be in doubt.

Greek Terra-cottas.

The majority of Greek terra-cottas are small figures in the round, varying in height from 4 inches to 12 inches. Occasionally they exceed these dimensions. These figures exhibit a variety of male and female types, some of which may be at once recognised as mythical personages, while to the majority no name can be assigned; many are probably mere studies taken from real life. They were generally cast in moulds, and afterwards retouched by the hand. Occasionally specimens occur which appear to have been modelled. Originally these figures were all painted in tempera, and some few still preserve their original colours. Many of these terra-cottas were doubtless votive offerings, and must be considered as separate figures; others formed part of larger compositions. In some cases these figures were attached to the surface of vases, when they were called emblemata. Compositions in relief are rarely met with. Such terra-cottas are found in every part of the Hellenic world, but especially in the tombs of Magna Græcia, which have yielded an immense variety of small figures. They have also been obtained by excavations in ancient cities, and especially within the precincts of temples. These figures are not to be regarded as elaborate works of art. They are modelled with great freedom and sometimes a little carelessly; but in the attitudes, and in the composition of the drapery, they show a felicity and boldness of invention which is well worthy of the attention of the modern artist. Many of them seem like sketches in clay, taken from life, or studies and recollections of the works of great sculptors. When we consider that they were probably in most cases the cheap and common product of the mere modeller (horoplatos), we see how generally a knowledge of art must have been diffused among the Hellenic people. The British Museum contains a very fine collection of figures of this class, chiefly from Rhodes, Athens, the Cyrenaica and Magna Græcia.

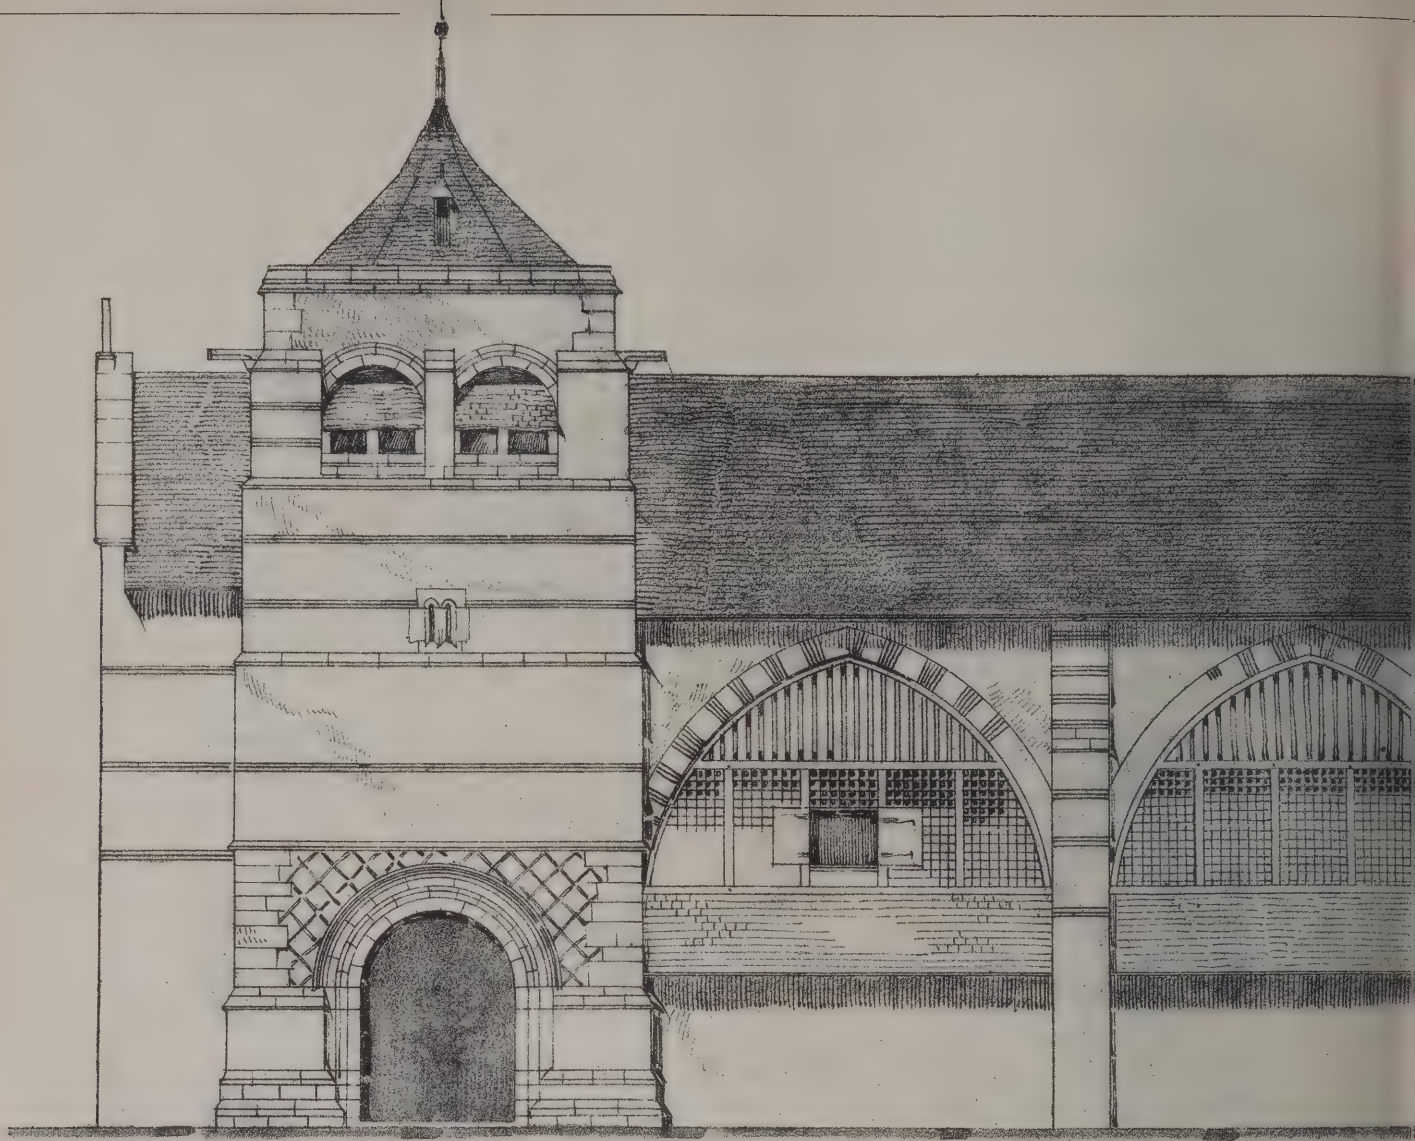
Normandy Churches.

The great churches of Normandy, like those of England, are commonly finished with the central tower. Perhaps they do not always make it a feature of quite the same importance which it assumes in England, but it gives them a marked character, as distinguished from the great churches of the rest of France. Elsewhere, the central tower, not uncommon in churches of the second and third rank, is altogether unknown among cathedrals and other great minsters of days later than Romanesque. It is as much the rule for a French cathedral to have no central tower as it is for an English or Norman cathedral to have one. The result is that, just as in our English churches, the enormous height of Amiens and Beauvais cannot be reached. But in its stead, the English and Norman churches attained a certain justness of proportion and variety of outline, which the other type does not admit. No church in Normandy except St. Ouen's, attains any remarkable height, and even St. Ouen's is far surpassed by many other French churches. But perhaps a vain desire to rival the vast height of their neighbours sometimes set the Norman builders to attempt something of comparative height by stinting their churches in the article of breadth. This peculiarity may be seen to an almost painful extent at Evreux.

NOTES AND COMMENTS.

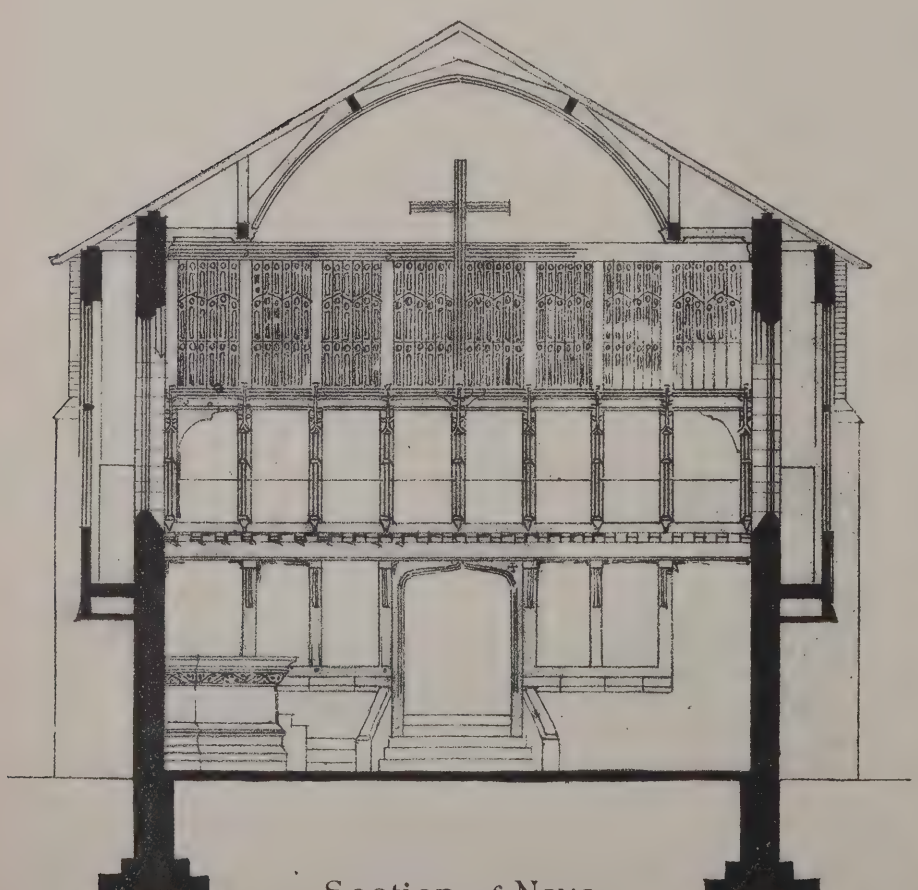
IN the last number of *La Construction Moderne*, Mr. LAWRENCE HARVEY describes the College of Masons which he has been instrumental in forming. The members consist of men who have gained diplomas after attending Mr. HARVEY'S courses of lectures on stereotomy. In that way a skilled body of stonecutters can be organised, who will be able to deal with the most difficult problems of masonry. To insure that the members will possess qualities of other kinds, it is intended to seek for certificates from contractors, which will testify as to the conduct of members while employed on works. It appears that several stonecutters have agreed to abide by the regulations, in order to provide that the College will become a guild of competent craftsmen, fit successors of the men who have covered Europe with marvels of construction. Many years have passed away since English workmen were inspired by so worthy an ambition, and it will be lamentable if the revival is not fostered with care. The College is one of the most satisfactory results of the great work undertaken by the City and Guilds of London, and it deserves close attention. But, unfortunately, there is a risk that the members may lose caste among their fellows, who are in favour of the uneducational system of the trades unions. It will, therefore, be almost cowardice to allow the College to fail for want of a little sympathy from those who should take a pride in its success.

THE Guardians of the Hastings Union continue to be the most merry of local authorities, and happily the topics afforded by the scheme for the improvement or rebuilding of the workhouse are not likely to be exhausted during the present century. At present enjoyment is afforded by two subjects. First, is a proposal of the Guardians for dispensing with an adequate workhouse, which the Local Government Board considered as seriously offered, and declined to approve. The error of the Whitehall Board gave so much amusement when it was announced, that it was proposed to send three favoured members to London and interview the Local Government Board as a sort of treat during the approaching festive season. The Chairman said he could not discover why a deputation should be despatched, and he was told the object was to wish the people in Whitehall a merry Christmas. If the whole of the Guardians were to be sent on the errand, we suppose the trip would be welcomed. The second subject is the architect's bill. He has offered to reduce it by 800*l.* A proposal to pay the balance owing—the sums received amount to 1,400*l.*—was set aside by a majority of five. It was then proposed to pay another 1,000*l.* on account; that also was rejected. A third proposal was to reduce the bill by 1,000*l.* instead of 800*l.*, to draw a cheque for 3,137*l.*, and thus put an end to the affair. But by one vote it was also lost. Another course of oratory will have yet to be gone through before a settlement is arranged, and probably it is thought wise to provide an entertainment for winter.



"MACBETH" has a fascination for foreign managers. Everyone knows that SCHILLER prepared a translation of the tragedy for the Weimar Hoftheater, introducing many lines of his own in order to conciliate the audience, who were slow in their mental action. DUCIS made a version for the Paris stage, which, however, was not intended to be compared with the original. There is a less wonderful but more faithful attempt by LETOURNEUR. About half a century ago a M. EMILE DESCHAMPS appeared, who announced that "le fanatism pur de SHAKESPEARE était dans l'air," and he could not escape from it. But he discovered that "Macbeth" was not free from voids, and accordingly he set about filling them. Even Frenchmen were able to perceive that an abundance of rubbish was shot into the voids in order to bring SHAKESPEARE up to a Parisian nineteenth-century level. Of late years M. PAUL LACROIX is accepted as the most French of translators, which means of course that "Macbeth" is transformed. His play was performed at the Odéon in 1863, with the success which nowadays awaits Shakespearean drama among students of the Quartier-Latin. It was repeated in 1885, and the tragedy is about to be again brought out on the same stage, but there is uncertainty about the "book" that will be used. The Parisians have witnessed so many adaptations, it might be well for once to try the effects of an accurate translation. At the Porte Saint-Martin "Macbeth" was also performed, but the characters were made subservient to the Lady Macbeth of Madame SARAH BERNHARDT. It was to "Macbeth" that in the last century the Abbé LE BLANC pointed to prove how skilfully SHAKESPEARE had depicted the natural impression which virtue makes on all, for the "scélérat" was scared at the thought that DUNCAN "hath been clear in his great office," and all human and divine powers were properly united "pour venger la mort d'un roi si débonnaire." Had he a prophetic vision of the revolutionary scenes that were to be acted before the century was over? But there is not much terror in the tragedy when seen on the French stage, for the witches with wigs of scarlet tow excite unrestrained laughter, and are not to be forgotten when they are off the stage. Still, laughter is better than the hooting which was the guerdon of the unlucky tragedians who first performed "Macbeth" after the Restoration. It might have been supposed that WELLINGTON and the more obnoxious Sir HUDSON LOWE were among the supernumeraries. When MACREADY tried the experiment a few years later he overcame all prejudice, and JULES JANIN admitted that, as Macbeth, the English player was as impressive as the great TALMA.

FOR some weeks past there has been correspondence in the Cardiff papers concerning a competition for a local school. The latest phase of the affair is rather remarkable. Mr. ROBERT WILLIAMS, of the Adelphi, was informed that his plans were about to be returned to him. The report of the assessors, of which a copy was sent to him was as follows:—"The number of competitors was seven, each supplying four sets of drawings, and after the most careful and searching examination as to the one most adapted for the purpose of this school, showing the most suitable and economical arrangement, having regard to the requirements of the Secretary of State, we have come to the decision that the best is No. 6, which is that of Mr. W. H. DASHWOOD CAPLE, of 1 St. John's Square, Cardiff. We also assert that even this plan is not free from defects, and urge that, if adopted, it should be considered subject to alteration." When his drawings arrived Mr. WILLIAMS discovered that the serial number on the drawing containing the plans and elevations, which appeared originally to be 6, had been tampered with, partly scratched out and Chinese white applied to it. The figure was then altered into a 2 and again into a 7. It is not unreasonable for Mr. WILLIAMS to imagine that his plans were those which as No. 6 gained the recommendation of the assessors. He proposes to hold the committee responsible for the detention of his drawings, and also to lay the correspondence and photographs of his drawings before the Home Secretary. It is evident some one has blundered in South Wales, and, that being the case, some more light should be thrown on the case.



THE death of M. ALPHAND will be likely to cause many changes in the Works Department of the Paris Municipal Council. The permanent staff is not large, and much of the work is done by outsiders. Many engineers and architects in Paris rely mainly on the occasional engagements which they receive from the Hôtel de Ville. The sums received are not extravagant for the services which are rendered. But there are councillors who cannot imagine the modest way in which members of the two professions live in Paris. They believe that money is laid out on temporary service which would be more than sufficient to provide for a large and capable staff throughout the year. If the contemplated changes are carried out they will no doubt affect the system of professional education. Winners of certain prizes expect employment under Government or municipalities, and if the Paris Council should adopt the plan of promotion "par les degrés de l'ancienneté," it may be assumed that other public bodies would imitate the example. It seems strange to many of the councillors that some of the members of the permanent staff should receive for a year's work smaller sums than are paid to temporary assistants for a fraction of a year, and as there is discontent among the staff, it is no wonder a reorganisation is demanded.

SHEFFIELD SOCIETY OF ARCHITECTS.

A MEETING of the Sheffield Society of Architects was held on Tuesday, when a paper on "The Architect and his Artists" was read by Mr. W. H. White. In the course of it the author said :—

Not the least remarkable result of all the researches yet made into the history of ancient and Mediæval buildings is the uncertainty of their origin in respect of design. The great works of old are identified with the names of kings, princes lay and ecclesiastical, bishops and clerks. In Western Europe, during the Mediæval period, the names of artists engaged in different occupations upon cathedrals and other buildings have come down to us, but the architect as we understand him is conspicuously absent or non-existent. An attempt to explain this away was made by Mazois, who maintained that among the Romans it was a deeply-rooted custom never to put the name of the architect upon a monumental building; in support of which he referred to Pliny (xxxvi. 12), who attributed magnanimity to Ptolemy because that ruler permitted the architect of the Lighthouse of Alexandria to inscribe his own name upon the structure. There have, however, existed such offices as architectus and ingeniator, or ingenarius (corrupted to engineer), supervisor (corrupted to surveyor), magister operum, and clericus operationum, devizor, master-mason, and other denominations pertaining to persons having charge of the execution of such buildings; and there are records of men in the fourteenth and fifteenth centuries who were imported from one country to another to reconstruct or superintend the reconstruction of cathedrals and other works of the kind, the largest amount of evidence under this head having been obtained by the late Mr. Street from the Chapter Archives extant in Spain. But who or what the men were who, in the twelfth and thirteenth centuries, inspired the design of structures absolutely identical in arrangement and methods of construction, though situated at remote distances from each other, in different countries and among different peoples, is still matter of inquiry and surmise. From whatever centre the design may have come, it was worked out as local circumstances permitted, and the works were directed by men trained on similar lines according to a recognised standard. That these superintendents spent most of their time on the buildings themselves as they were rising is almost certain; and it is absolutely certain that such buildings were not executed under a general contract, or by the personage now called a general contractor. The difference between the educational and social attainments of the artist or workman, and those of the master who directed him, was infinitely less than exists at the present day between the artisan or artificer and the architect.

It may be interesting to quote a letter written to me in December 1874 by the late Sir Gilbert Scott :—"If," said he, "in the Middle Ages, in the countries on this side of the Alps, workmen, clerks of the works, builders, masons and architects were jumbled together, it followed that the study of architecture was followed up by all of them. If at the same and somewhat later times, on the other side of the Alps, the jumble was rather between architects, sculptors, painters and workers in mosaic, it equally follows that all of these classes studied architecture. We know this by the results, which speak for themselves." His contention obviously is that in the great periods of architectonic progress the artist or workman who aspired to take part in the execution of a great building had to learn architecture, which thus not only theoretically included within itself the attendant arts of painting and sculpture, but used them both to explain the purposes for which a building was erected—in other words, as voices to tell its story to the population of the time and to posterity. Recent dogmas of individualism or specialism must be dismissed from minds desirous of understanding how some of the old buildings most venerated at the present day were designed and carried out. If in the minor arts it was the system of pupilage which produced results that are now admired, and foolishly thought to be unsurpassable, it was not the same divided system as that now in vogue. It was not the grouping of pupils around a specialist to study theoretically the specialty he practises, but the study by all young artists of the one grand art, architecture, on the buildings themselves, in daily converse with the executants, under the eye of the master or his elder disciples—a system of which only a rudiment remains in England, but which still exists in France, though in a modified and restricted form.

France, moreover, has preserved the custom of continuity among the craftsmen composing the various building arts or trades, and thus to some extent insured herself against such strikes as we now witness in England. The *apprenti* and the *compagnon*, if he have wit and courage enough, can rise, and does rise as a natural sequence, to be a master, and enter into contracts with employers for the execution of works in his particular trade. No such possibility is open in this country to the workman in any of the ordinary building arts; here he is the dependent, hopelessly bereft of the emulation necessary to all progress, of the capitalist master, whose only necessary qualifications for the position he holds are business aptitudes and a certain power of organisation. The capitalist is the acknowledged master of mason, bricklayer, carpenter, smith, slater, plasterer and every other worker in the building trade, without having served an apprenticeship to any one of them, and without of necessity being acquainted with even the remotest detail of building-construction. His dependents—the workmen whom he employs—treat him, not as a master from whom to learn and improve on their work, but as a sweater of whom it is quite fair to take advantage whenever possible. The only palliation of the system of general contract, as we now have it in England, is that the capitalist contractor shall have been educated as an architect, and there are a few instances in which this already occurs. In fact, the late Edward Barry, R.A., once told me that in his opinion an architect with capital could not do better than become a general contractor, and execute as well as design any buildings entrusted to him. As it is many contractors employ architects and draughtsmen in their offices, to the detriment of the architectural profession, and there is every prospect, in my opinion, of a serious development of the practice. Under actual circumstances in England the power and universality of the architect are so diminished by the regular presence on every building of the capitalist master, who follows the course of the work, while the architect is represented there only by his drawings and a half-educated clerk of the works, that I doubt much whether the trouble saved to the architect by the employment of a general contractor compensates him for the loss of influence he suffers therefrom in the direction of the several crafts or trades. In Paris and France generally the architect is the sole and supreme master of the work, and his relations with the master-workmen are constant and direct. He makes his contracts not with one capitalist, but with a dozen master-tradesmen, who each work under his direction, and who look to him only for orders to fix materials and assist each other at the several stages of the work. This fact renders it essential for an architect in France to be a constant visitor on the works with the superintendence of which he is entrusted; and I have known architects who, if their buildings were in Paris, visited them daily, and, if at a moderate distance from the capital, twice or three times a week. The visit of a French architect to a building in course of erection under his orders is a most characteristic ceremony, and not confined to the largest works. He is followed throughout by the masters of each trade engaged, by his assistant-architect, who probably lives at the works, and by the principal foremen. The consequence of this system is that the business of architecture is more equally distributed in France than it is in England: the architect takes less work, and, moreover, makes less out of it, for it costs less in execution. Obviously, there are fewer rich architects in Paris than in London, but I think that the average income of architects in the French capital is larger than it is in the English one. At the same time his honorarium is less, and it is divided as follows :—

	Per cent.
Preparation of the design, specifications and estimates	1½
Conduct of the works	1½
Verification and settling of the accounts	2

Thus it will be seen that the design is authoritatively valued, in a great artistic country like France, at less than a third of the 5 per cent. commission paid to an architect both there and in England; and the Frenchman, in addition, has to pay his own surveyor or *vérificateur* for checking the measurements made by the contractor's *métreur*, whose recognised charge is 1 to 1½ per cent., which last charge is included in the contractor's accounts. I have often thought that if the British public were only as shrewd as foreigners think they are, they would pay the "artist"—the new architect of whom we have heard—2 per cent. for his work, instead of the 5 which he remorseless exacts; and possibly then there would be less said about the art, to the exclusion of the science and business, of architecture than there is at present.

That the general contractor can be dispensed with in certain cases, one has only to examine the Hôtel Métropole at

Brighton, and other buildings of like importance in London; and that he may one day be dispensed with altogether I fervently hope, not only for the sake of the architect, and the artists whom it ought to be the latter's function to direct, but also for the arts which, from the highest to the lowest, in every ancient monument extant admit their allegiance to architecture. There is danger, of course, in any reversion to the old custom of an architect, as the agent of his employer, purchasing materials and employing labour. Thereby the abuses, against which Professor Donaldson and others contended, and to destroy which they founded the Royal Institute of British Architects, might be revived.

I believe it has been established beyond doubt that the Mediæval guilds in their corporate capacity did not teach; they merely examined. The technical education of those days was an affair of master and apprentice. Membership of a guild or corporation implied that apprenticeship had been served for what would now be called a long period, and an examination satisfactorily passed. The member or master entered into certain obligations and submitted to certain rules of discipline, which were alike an honour to him and a protection to the public. He was allowed to take a certain number of pupils, who in due course became masters and members of the guild; and this went on from generation to generation. But these customs, which in the sixteenth century were doubtless thought old-fashioned, were largely interfered with by the extraordinary influx of foreign workmen from Italy and France, attracted by the wealth (comparatively regarded) of this country and its desire for improvement in the arts. It was only after the disintegration of the guilds, and prior to the foundation of academies, that a selected few were dubbed, by the personal favour of monarchs and reigning dukes, ducal engineers, ducal painters, architects and sculptors of the king, and permitted to use other high-sounding titles of a like kind. It was such men who in Paris, in the time of Louis XIV., formed the Academy of Painters and Sculptors and the Academy of Architecture, both of which merged into the Academy of Fine Arts and were resuscitated as part of the Institut de France by Louis XVIII. in 1816.

The main principle of the Mediæval guild was the consolidation of all workers in a particular art or mystery (which means *mestier*, or trade) as a corporate body, and these professed practitioners enjoyed equality among themselves. The main principle of the Academy, as it has come down to us from Italy through France, is the selection of a few who by personal favour are placed above their fellows in the same art, and who, as members of the Academy, are absolutely free from all professional discipline whatever. The Mediæval principle reflected a spirit of true equality; the modern academic spirit is of the very opposite description and totally opposed to the great doctrine of modern legislation which in this country is peculiar to no one political party—the security of the greatest happiness of the greatest number.

The influence of an academy, especially when subventioned by the State, is always largely enhanced by the fact that it is situated in the capital city, imperial, royal or republican, as the case may be, and as all such centres possess an extraordinary attraction for the youth of a country, as success in the provinces is always burning to repeat itself in the metropolis, great capitals swell every year in dimensions. A lifelong struggle for work is deemed preferable by a great mass of Englishmen to a modest practice in a provincial city, principally because the best men of a nation are supposed to collect in its metropolitan centre, and if this superstition hold good generally, the elect of the best men, the chosen few, say, of a great profession, must hold a position not less advantageous to their own interests than prejudicial to those of their brethren in the same capital. It follows, therefore, that that position must be still more prejudicial to the interests of the whole body of the profession throughout the entire kingdom. Indeed, I shall divulge no secret if I venture to state my belief that London, which grows larger every day, is not behind other imperial capitals in its willingness to do the whole work of the empire. London, in fact, is equally prepared to do the work of a large part of the whole world if the world will only let it; and I am quite sure, as far as architecture goes, that London is prepared to design and erect buildings all over these islands and far beyond the limits of these shores, even though the architects resident in the respective localities affected may raise a sentimental objection.

It will be admitted, I think, by men of the world that there are excellent reasons for preferring the principle of the Mediæval guild to that of the modern academy. The political prosperity of a State is not to be measured by the existence of a despotic monarch, with a few highly-placed nobles and a disorganised population of ignorant and uncultivated subjects; the wealth of a State is not to be measured by the existence of a few millionaires in the midst of a population of poor and needy persons. The French architect-academicians design and personally superintend the execution of public buildings, or they hold the post of inspectors-general of national monuments or diocesan edifices, or State schools or prisons, &c., but they seldom accept private practice, and their annual incomes are often less than those of the ordinary practitioner. So recognised, however, is their position that the post of President of the Central Society of the Architects of France is allowed to be held only by one of the eight architect-academicians, and no member of the Society, except he be of the Academy, can rise higher than vice-president. Yet no one grudges the Academicians their well-earned distinctions, and no one fails to pay them the respectful homage which is their due. Very different is the position of an architect member of the Royal Academy in London. There is no need for him to earn by any special training the honour of election; there is no standard of excellence, scientific or artistic, except perhaps the fashion of the decade and the personal esteem of those in power, to which he need conform, and his chief obligation is to exhibit sketches of his works in the Academy Architectural Room.

The danger of playing to the public in general, in exhibitions of architectural sketches, is seen in the observations made by highly-placed critics—by men of science such as Professor Huxley, whom nothing will ever convince that architecture is not an applied art; and here, perhaps, the distinguished scientist may be pardoned for maintaining an opinion which he arrived at many years ago, and which seems to be not opposed to the tenets of an artist so distinguished as Mr. Norman Shaw. Professor Huxley would build a brick shell, and in later years, when enough money could be got, would order an architect to adorn it with a front; and, under such conditions, were architecture only an art, the Professor's advice would be good. The three artists, in perfect unison, would be called in at the right moment to arrange and apply to the shell the lines of the front, which would be architecture; to arrange and apply the ornament, which would be sculpture; and to arrange and apply the colour generally, and the subjects to be depicted in particular, which would be painting. That would be a perfectly feasible consummation, if the employment of an engineer to construct the building which the front is intended to hide be accepted, and if a surveyor be entrusted with the business part of the transaction. But there is a higher and better way to attain unity in art. The young men who aspire to be sculptors and painters, no matter in what category of those two arts, should commence their career by studying architecture, theoretically, and afterwards for a short period of probation, practically. Nor is it improbable, as education advances, that such a course may be adopted in the training of painters and sculptors, more especially if, as seems also likely, a return to the proper employment of those two artists on national and municipal buildings be rendered possible; and it must be owned that the country would lose little by an enforced dearth, however protracted, of easel pictures and pedestal statues of the type now common.

It will doubtless be admitted that when a youth chooses, as it is called, a profession, he takes a leap more or less in the dark; and if one who has jumped into the crowd of painters or into the crowd of sculptors finds out, as day breaks, that he has made a mistake, it is difficult for him to acknowledge the error. Though he hopes to mend his position, he has learnt the rudiments of painting only, or of sculpture only; but if he had studied the rudiments of architecture, the choice not only of that art, but also of its endless subdivisions, would have been open to him. At the worst, if he ultimately decided to relinquish the pursuit of it or any subdivision of it, the time he had devoted to its study would not be lost to him, no matter what calling he might choose for a career. All hope, however, of making the study of architecture the basis of art education must be given up if it is to be treated as a specialty, or as an art only in the modern æsthetic sense of the term.

What is that art? What, in fine, is "architectural art" in its modern æsthetic sense? Let us test it by the experience of the present happy reign of Queen Victoria, for even those who are but approaching their half-century can offer a reply to this crucial question. When, about a generation ago, they were beginning their professional lives, there existed among British architects a supreme, an irrepressible contempt for the artistic character of the works executed by their fathers and grandfathers; and at the present time I encounter everywhere signs of doubt and disappointment respecting the artistic merits of works designed and executed less than fifteen and thirty years ago—during a period, in fact, when artists have been more or less confident that the right thing was being achieved. What is the obvious inference?

It was a pretty poetical idea of the ancients to represent the Temple of Nemesis as always open during a triumph, and the new architect, in the present hour of his newest success, may even now perhaps be haunted with the warning words poured into his ear by some miserable cynic: as your fathers and grandfathers despised the works of their predecessors, as you contemn the works of your fathers and grandfathers, so will your works be treated by the sons and grandsons who outlive you. The short experience of half a century suffices to show that the architectural art which a comparatively recent

generation believed to be good, the succeeding generation believed to be bad; and architectural art of the modern type applied to a building seems to be neither tangible nor capable of progressive development. Scientifically and artistically-constructed buildings are what the educated public want, and if they are sometimes hard upon an architect it is because of his bad building, not of his bad art. I am sorry thus to dissociate building from art, and can only offer in excuse the present pernicious application of the ancient word "art" to something ethereal in the domain of architecture. With the followers of Mr. Norman Shaw art appears to be a sentiment, a feeling or a fancy, derivable from a fund of æstheticism in their leader's possession; and the leader is apparently unconscious that the promissory notes now drawn upon it may be dishonoured at the first radical change of fashion or the next reversal, in the lifetime of half a generation, of every artistic principle that the preceding half held to be true and irrefutable.

A discussion took place, in which the President, the Vice-president, Mr. E. M. Gibbs, Mr. C. Hadfield, hon. sec., Mr. J. B. Mitchell-Withers, Mr. J. Smith and others took part, and a vote of thanks was given to the lecturer.

ROYAL SCOTTISH ACADEMY EXHIBITION.

AMONG the works by noted English artists which will be included in the exhibition of the Royal Scottish Academy this year, there will be two examples of Mr. Alma-Tadema's art, and a representative work by Sir John Millais. But the Council, who have been engaged receiving and selecting the works sent in—a much larger number, by the way, than usual—are satisfied that the feature of the exhibition will unquestionably be a loan collection of the works of the late Sir William Fettes Douglas. Private individuals when approached have readily consented to lend the Academy any example of the late President's work they possessed, and the result is that a splendid collection has been got together, numbering about thirty oil-paintings and a score of water-colours, some of them painted thirty years ago. Of recent years the public have had practically no opportunities of seeing the works of the late President, and this collection, it is believed, will be to many in the nature of a revelation, and will give a proper indication of his distinguished merits as an artist.

THE GLASGOW ART GALLERY AND MUSEUM.

AT the meeting of the Glasgow Town Council on the 3rd inst., the Lord Provost said:—It has been suggested to me that I should to-day give some information regarding the present position of our association for the erection of fine art galleries, concert hall, museum and school of art in Kelvingrove Park, in which, as you are aware, I am taking a very earnest interest. Having been appointed convener of the Indian Section of the International Exhibition, I did my best, while in India in 1886 and 1887, to obtain suitable exhibits, and on my return co-operated with Sir James King, Bailie Dickson, Bailie Shearer and others, in helping forward the exhibition by every means in my power. When the accounts were closed, we had a surplus of 46,000*l.* available for the erection and equipment of an art gallery and museum, but that amount was manifestly inadequate for the erection, much less the equipment, of an art gallery and museum suitable for Glasgow. Numerous meetings and consultations were held by those interested as to where the buildings should be erected and how the additional funds should be raised, and many proposals and schemes were put forward and carefully considered. At an early stage it appeared to me, for many reasons, that a portion of the site occupied by our International Exhibition in the Kelvingrove Park was the best that could be chosen, and, provided that site was agreed to, I offered to give a substantial subscription to help forward the movement. Finally, it was arranged between the executive of the exhibition and the Parks and Galleries Trust that if the association raised a further sum of 46,000*l.*, the Corporation would grant a free site in Kelvingrove Park. An executive committee was appointed to carry out the work, composed of eighteen members—twelve nominated by the Town Council and six by the Association—and it was arranged that the buildings when completed should become the property of the Corporation. On this understanding I very willingly subscribed 15,000*l.* Other citizens have contributed very liberally, and we are now able to report that a sum of 55,000*l.* has been raised by voluntary subscription from a comparatively small number of citizens. The surplus from the exhibition was originally 46,000*l.*; interest accrued has increased this to 48,000*l.* Thus we have already 103,000*l.* available. Arrangements have been made to appeal immediately to the whole community. Many members of the Town Council have contributed nobly. Some of those who have recently joined from the new wards may not have had the scheme so fully placed before them as I have now done. We propose very soon to print a list of the subscriptions, and I would like to see the names of as many members of the Town Council as possible on that list. Subscriptions are payable in equal instalments over a period of four years, and we will be glad to have any amounts from the smallest to the largest—of course, the larger the better. I will be much gratified if intending subscribers would kindly communicate either with the honorary secretary, Dr. F. L. Robertson, or myself or any other member of the committee. In pushing forward this scheme the services rendered by Dr. Robertson have been invaluable. No man could possibly have done more than he has in obtaining subscriptions and in helping in every department. Sir James King, Bailie Dickson, Sir William Arrol, Mr. Robert Gourlay, Mr. Renny Watson, Mr. Clapperton and others have also taken an enormous amount of trouble in pushing forward the enterprise. We issued about 200 schedules showing a plan of the site, the surface levels, and supplying other information. I understand sixty sets of plans have been sent in, and Dr. F. L. Robertson and Mr. M'Donald, our city engineer, are at present engaged hanging these in the rooms upstairs. Mr. Alfred Waterhouse, R.A., will make a selection of what he considers the six best designs, and the architects whose designs have been thus selected will be invited to take part in the final competition.

DRAINAGE OF TOWN HOUSES.

AT a meeting of the Society of Engineers held at the Town Hall, Westminster, on December 7, Mr. W. N. Colam, president, in the chair, a paper was read by Mr. G. M. Lawford on "The Drainage of Town Houses." After alluding briefly to some of the now well-known defects in the earlier attempts at house drainage, the objects to be attained in carrying out a perfect system of drainage, with special reference to drains passing under houses, were stated to be as follows:—1. The primary disconnection of the house-drain from the main sewer. 2. The thorough ventilation of the entire system. 3. The secondary disconnection of the rain and waste-water pipes from the house-drain. 4. The immediate and absolute removal of all matters discharged into the drain from any source whatever. And lastly, 5. The construction of the entire system in such a manner as to prevent foul gases or currents of polluted air from entering the house, and of such materials as to preclude the possibility of the leakage or escape of both gases and liquids.

The meaning of the terms "disconnection" and "trap" was then explained, and descriptions of the different forms of disconnection were given, showing the usual type of manhole with intercepting trap and air inlet. With regard to the ventilation of drains, attention was drawn to the fact that in order to create and maintain constant circulation an inlet is necessary as well as an outlet, the position of each being so arranged as to produce a current of air throughout the entire system.

The question of trap ventilation and syphonage was gone into, reference being made to the necessity for ventilating the traps on a horizontal tier of appliances, such as a range of lavatories, as well as those on a vertical tier, such as a soil-pipe. The separate trapping of every appliance was also advocated. The treatment of waste-pipes and the different forms of gullies were taken conjointly, the practice of doubly disconnecting the former by means of hopper heads being strongly condemned.

The three essential factors for facilitating the immediate removal of all matters discharged into the drain were stated to be the size and inclination of the latter and the water-supply. Instances were given showing the sizes of drains in relation to the greatest possible volume discharged into them, and the advantages of using 4-inch drains were described and advocated. The utilisation of automatic flushing for the removal of grease in preference to its collection by grease-traps was also considered under this heading.

The water supply and service was touched on briefly, special attention being given to the question of separate cisterns for closets and for domestic purposes, the author maintaining, in spite of the popular belief to the contrary, that, under the special circumstances described in detail, drinking water could be used with safety from a cistern supplying a closet.

The construction of the entire system in such a manner as to prevent foul gases or currents of polluted air from entering the house was described as embodying the various points advocated in the paper, namely, thorough disconnection and ventilation; treatment of waste-pipes as disconnected soil-pipes; separate trapping for every appliance; 4-inch drains combined with automatic flushing and a good supply of water.

The question of the best materials for the prevention or escape of gases and liquids was treated under the three sub-headings of—(1) the underground drains; (2) the rain-water, soil and waste-pipes; and (3) the appliances. Regarding the

first-mentioned, a comparison was given between stoneware and iron, the latter, though undoubtedly more expensive, being given the preference on account of the greater safety obtained by its use, the smaller number of joints required, and the certainty of sound joints between lead soil-pipes and the underground drain. The ordinary painted rain-water pipe was described as a nuisance, owing to the certainty of its choking sooner or later from internal rust; and galvanised pipes were stated to be the best for rain-water, and lead for soil and waste-pipes.

Regarding the appliances, urinals were alluded to briefly, the author considering them out of place in private houses, and advocating intermittent automatic flushing in all cases. The three forms of closet in general use, namely, the valve, wash-down and wash-out, were described in detail, the former being considered best. The principal objection to the two latter when made in one piece of earthenware being the connection with the soil-pipe, but this difficulty was being overcome by the introduction of lead traps specially adapted to pedestal closets.

In concluding, the author drew attention to the necessity for testing all drains by hydrostatic pressure, as being the only test in any way resembling the pressure to which drains were liable when a stoppage occurred.

THE EARTHQUAKE IN JAPAN.

A DETAILED account of the terrible earthquake in Japan on October 28, which affected thirty-one provinces, has been sent to the *Times* by its correspondent in Tokio. As regards the way in which buildings and engineering works resisted the shocks he says:—The effects produced on engineering structures are in many cases extraordinary. One brick railway arch between Nagoya and Gifu collapsed in consequence of its abutments, 14 feet high and 5¼ feet thick, having been thrown apart in opposite directions. The roadway beneath has a transverse crack 4 inches wide. Three great railway bridges within a radius of six miles from Gifu, crossing the rivers Kisogawa, Nagaragawa and Ibagawa, have suffered badly, the massive piers of brickwork or iron having been broken across, though the iron girders, of English make, withstood their terrible treatment wonderfully. All of these bridges were thoroughly good, strong structures, and have been in use for five years without suffering in any degree from such potent destructive agencies as the fierce typhoons and river-floods of Japan. The minor bridges throughout this district have also been wrecked in various ways and degrees. And generally, from its effects on engineering and other structures, the earth-movement on the 28th seems to have been at least as violent and extreme as that of any earthquake in the history of mankind.

It is already recognised that, had such precautions as the building laws proper to earthquake areas been in force, much of the damage might have been averted—not in the central region of disturbance, where the destroying powers were so irresistible, but at least in the outer area, where it is found that destruction has been practically limited to old, rickety, or rotten edifices. Generally, the effects of the earthquake confirm accepted theories in some respects, and in others teach new lessons. Mill-chimneys, for example, were broken across the middle—which was to be expected, their tops being free to sway—just as a carriage whip may be snapped in half by violent back-and-forth jerking. Bridge-columns, on the other hand, being of uniform section and loaded, went, naturally, at the base. The fine old castle of Nagoya is almost unharmed—a fact due, doubtless, to its shape, which is somewhat that of a pyramid in decreasing stages, as well as to the immense strength of its walls, and to the girdle of protection afforded by its deep, wide moat. Many of the more solidly-built temples also showed wonderful powers of resistance. Among the lessons taught by the earthquake is an important one bearing on seismometry. The experience on this occasion, Professor Milne tells me, confirms an idea he has long entertained—that whenever vertical movement takes place it means that oceanlike waves are passing beneath our feet, and that what have to be measured in order to determine this motion are the angular tips of the surface, for which a new class of instruments must be devised. It would have been interesting if means had existed for ascertaining the times of propagation of the great shocks to distant points in the surrounding region. But, for the reason already given, no trustworthy time-records at or near the origin were possible. A curious feature observed at Nagoya is the heaping of the tiles, on some roofs still erect, in waves with their crests lying approximately north and south—that is, in lines perpendicular to the direction of the earthquake-throws. The behaviour of buildings and of the fragments thrown from them also affords an interesting field of research, and gives evidence of extraordinary twisting and rotation. Gradually, full information on these and kindred matters, already being investigated by experts on the spot, will doubtless be given to the world. The opportunity of adding to our knowledge is a rare one, and it is to be hoped that engineers and architects at home will avail themselves of the valuable *data* that will soon be put before them. Not only are some of Great Britain's possessions liable to serious seismic agitation, but English professional aid and English capital are largely employed in engineering concerns in the earthquake-ridden territories of other nations.

Another correspondent of the *Times* says:—In the space of a few seconds the half of beautiful Japan was mapped out into areas of violent and relatively feeble movement. It was a repetition of one of nature's sermons, from which we have learned that at the time of earthquakes soft materials suffer more than those which are relatively solid. Not only have we this broad distinction in the distribution of earth motion, but every given area shows that movements have been anything but uniform in all its parts. A good illustration of this was noticeable in the effects produced along the railway line, which showed that the slightest differences in surface contour had a marked relationship to the destruction which had been produced. Wherever there was a cutting the line remained intact, and it was evident that the motion had been relatively small. To the right and to the left the surface-waves had been discharged upon the faces of the banks, whilst at the bottom of the cutting the motion had been similar to that which we should find a few fathoms beneath the surface of a stormy ocean. Unfortunately the cuttings were few, and the general appearance along the track was as if some giant hand had taken rails and sleepers and rubbed them back and forth in their bed of ballast, piling the sand and gravel into bolster-like ridges. At places where the sleepers held too tightly to their bed the rails themselves yielded and had been bent into snakelike curves. The actual process by which these appearances had been produced was in all probability an inverse but equivalent action—the rails and sleepers by their inertia and longitudinal rigidity remaining at rest while the ground moved back and forth beneath them. Another curious appearance observable along many sections of the track was that it had been bent bodily for several feet, sometimes to the right, sometimes to the left. These bends, it was observed, occurred where the line crossed, more or less at right angles, a slight depression, possibly marking the line of an ancient watercourse. At such places as these the impression conveyed was that the material in the trenches, which were from 50 to 100 yards in breadth, being softer than the surrounding country, had therefore conveyed a greater quantity of motion, which, striking the land transversely, had caused a permanent displacement. At these places and at many others where the country was uniformly level many fissures, which were generally parallel to the line, had been opened. They were usually from a few inches to two or three feet in width. In some districts they ran east and west, and in other districts north and south. From many of them mud, or a mixture of sand and water, had issued. Here and there small mud craters had been formed, the origin of which may be explained on the assumption of waves of compression, acting on beds of watery material beneath, bursting the superincumbent crust and shooting the soft material upwards. The most serious destruction, however, occurred at the bridges, which were designed and erected some five years ago by Mr. C. A. W. Pownall. These are almost entirely built of iron, put together in spans of from 100 feet to 200 feet, and stretching over lengths of as much as 1,800 feet. The supports in some cases are of masonry, being 10 feet in thickness, 26 feet in depth, and from 40 feet to 50 feet in height. The approaches to these bridges, which, it will be observed, are engineering structures of considerable size, are on embankments. Ascending one of these embankments you see the line before you twisted right and left, having the appearance of a gigantic serpent on a hillside. The ground is cracked and thrown into huge waves, whilst near the bridges the embankment has been shot from beneath the sleepers, so that the rails remain suspended in the air in huge catenary-like curves. The huge masonry piers have almost invariably been cut through near their base, and have then been danced and twisted from their true position. Some are inclined, and the heavy girders have slipped endways. Where cast-iron columns filled with cement were used as piers, fracture has again taken place near the base, and in one instance these huge cylinders have been snapped in several pieces, much as one might snap a carrot, and the fragments thrown outwards upon the shingle beaches of the river. Brick arches have simply fallen between their abutments, which appear to have opened outwards. For vertically-applied forces the structures, from an engineering point of view, were all that could be desired, but in consequence of horizontally-applied stresses the inertia of the upper parts has resulted in fracture at the base and an appalling destruction. For five years the railway works withstood traffic, typhoons and floods, fulfilling all the duties that were expected of them. When they succumbed it was not only to the unexpected, but to the application

of forces practically irresistible. Near the rivers, the free sides of which have allowed of motions larger than in the plains, fissures have opened large enough to take in men, and where several have occurred side by side sinkages have resulted which might engulf buildings. Villages and towns near these rivers, of which there are many, have been entirely levelled, and at one of them, containing some 1,900 people, 900 of the inhabitants lost their lives. The ruins of many towns caught fire, and hundreds who otherwise might have been rescued were lost in the flames. For twenty-eight miles no stations remain, only platforms and doors, covered with fissures and hummocked, thrown into waves, mark their places. The railway officials appear to have been singularly fortunate in escaping. This may possibly be attributed to the fact that, the station buildings being well constructed, they had not fallen so suddenly.

In many towns everything has disappeared, and in all directions as you travel across the country the thatched roofs of farmers' houses cover the fields like so many huge saddles. In towns like Nagoya, where, perhaps, only half the buildings have fallen, it is noticeable that no modern European structure of brick or stone has survived. Tall chimneys have collapsed, and cotton mills containing many thousands of spindles are heaps of ruins. The Nagoya earthquake will certainly act as a check to the adoption of so-called "foreign" structures. When building regulations are brought into force it is possible that the character of brick buildings may be improved, and they may at least be able to withstand earthquakes as well as Japanese buildings.

THE TOTNES TOWN HALL.

THE ancient town of Totnes, writes Sir J. C. Robinson, is one of the most delightfully unchanged and unspoilt places in this country, but the conscript fathers of the town seem to be quite unconscious of the charm which gives it pre-eminence over hundreds of bigger, richer and more bustling centres. If they had the remotest idea how original, interesting and venerable is their quaint old town-hall, with the ancient grammar-school tacked on to one side of it, both overshadowed by the grand old parish church, the very last thing they would do would be to make up their minds to pull down part of these buildings to erect in their place a hideous new police-station. Yet this is what the Totnes authorities are about to do. Can nothing be done to prevent this dire defacement of an old-world picture, beautiful and perfect in its way? The grammar-school is the doomed building. Kindly, however, let me make a suggestion. This structure, kept as it is outside, and but little altered within, would make an excellent and most appropriate town museum, an institution which as yet Totnes does not possess. On the face of it the site is entirely unsuitable for a police-station; it is quite out of the way, and without any carriage access: it can only be approached in fact by two long and narrow ancient alleys, scarcely wide enough, indeed, for a wheelbarrow to pass; one of these, indeed, ends in a steep flight of steps, which even that vehicle could not traverse. The first strokes of demolition have, I fear, commenced. Perhaps there is yet time to arrest the destruction, which, should it be consummated, most assuredly all the world and Totnes will bitterly regret.

SANITARY CONDITION OF FLORENCE.

AT a banquet recently given in his honour at Florence, Sir E. Douglas Galton, referring to the proposed sanitary improvements of the city, said:—"You will naturally wish me to say a few words upon my impressions of Florence. I have not been occupying myself during my short stay with art and artists, but with its engineers and its sanitation. There is one thing which strikes me prominently in considering this question, and that is the very great progress in health which Florence has made in recent years. In looking over the municipal archives I find a complete programme of works for the sanitary improvement of Florence, dating from 1870. These were—the regulation of the Arno, the prevention of floods in the town by new drainage, removing slaughterhouses out of town, the supply of water, the removal of low-class, insanitary dwellings, and replacing them by wider streets and better houses. These improvements are still in progress, but in order to give an idea of the effect they have already had, I took the death-rate over a long period, namely, from 1818 till 1877, when the operation of the improvements might be assumed to have commenced. I find that the average annual death-rate for that period was 346 per 10,000. In proportion as the new drains were constructed and the water from the Anconella became substituted for that of the wells in the town, the death-rate decreased gradually to 328, 286, 263 in the succeeding years, and in 1890 it was 263, notwithstanding the epidemic outbreak of typhoid in December. I have looked through the archives for an account of previous epidemics of typhoid in Florence. In 1816-17 there was an epidemic which carried off 2,000 victims, while last winter, as an evidence of the sanitary improvement of the city, only 234 succumbed. It may interest you to compare the epidemic of Florence with that of Pisa. The death-rate from the epidemic at Florence last winter per 10,000 was 12·79, whilst at Pisa the death-rate was 37·50 per 10,000. As a military engineer I took some interest in seeking out what effect the conditions at Florence have in respect to zymotic disease upon the garrison as compared with other garrisons in Italy. Out of 29 cities in Italy which have a numerous garrison only two present a lower mortality from typhoid than Florence, 26 have a larger mortality, many much larger. Indeed, many cities and some capitals of Europe show a greater typhoid rate. There has been undoubtedly a considerable improvement in the health of Florence in recent years. It is a gradual improvement, not only in general death-rate, but in that from preventable diseases, such as exposure, by typhoid, tuberculosis, &c. This improvement has followed the public works—that is to say, it has followed the length of drains made, the number of concessions made of *acqua potabile*, and the removal of old buildings. There remains, no doubt, much to be done to finish these works, but there can be no question that if these very important works of drainage are pushed on and arranged so as to enable Florence to send away rapidly all fæcal matter instead of retaining it in its midst, Florence would rapidly become one of the most healthy cities not only in Europe but in the world.

CHEMISTRY OF BUILDING MATERIALS.*

THE subject before us to-night, "The Chemistry of Building Materials," is one the proper treatment of which would occupy far more time than we have at our disposal. If I ventured upon the discussion of all the materials used in building, and the innumerable and often extremely complicated chemical processes involved in their manufacture and use, a dozen lectures would hardly suffice to do justice to the subject. I propose, therefore, to treat only one or two of the more important materials, and to confine myself to the main chemical reactions which take place. I will ask you then to consider this lecture rather as an introduction to the study of the chemistry of building materials. I shall endeavour to point out the differences in composition between the different varieties of stone used for building, and to discuss the action of the weather upon the different varieties. We shall study the different classes of mortars and cements, their composition, method of manufacture, and particularly the important point of their hardening and setting properties. I hope to be able to have time to say a few words as to the manufacture of the different varieties of iron.

I am of opinion that too much stress cannot be laid upon the necessity of a thorough knowledge of the part that chemistry plays in the formation and destruction of the materials used by the builder. A knowledge of the composition of the substances he uses is of invaluable aid to the conscientious architect; a knowledge of the destructive agencies that his materials will have to face will direct his choice in their selection and manufacture. Without such knowledge the weathering qualities of any stone could only be judged by the test of experience; by waiting fifty or sixty years to see how the stone stood the weather. A scientific knowledge of the materials employed and the agencies slowly at work at their destruction will enable him to remedy defects, to suggest improvements, and is indeed of absolute necessity to those who desire that their work shall progress; that each step forward shall be a distinct advance in experience and knowledge. Such a spirit, which has animated all the masters of their craft, can only be satisfied by a thorough knowledge of the conditions under which he works. I am confident that every architect present feels this to be true, and if there are any of the younger men who are of opinion that nothing more is required of the architect than to be able to draw out the plan and leave the working details to practical men, I warn him most strongly against that opinion. I do not mean to say that the architect should mix his own mortar and quarry his own stone; but I do maintain that he should thoroughly understand every detail of practical work connected with his profession, and should be imbued with the scientific spirit of inquiry and observation, if he desires that his work should be more than a mere contract job.

Stones used for building purposes may be divided into two classes, according to their composition. The hard siliceous stones—granite, basalt, porphyry, sand stones and the soft, which are derived from limestones—principally consist of calcium carbonate.

Granite is an igneous or metamorphous rock, occurring in the primary formations. It is a compact, granular, crystalline

* A paper by Mr. F. B. Guthrie, F.C.S., Demonstrator of Chemistry at the Sydney University, read at a meeting of the Sydney Architectural Association.

rock, composed of quartz, felspar and mica in varying proportions, of which felspar predominates. The felspar is white or pink orthoclase. Oligoclase and albite are common, and are distinguished by their fine striation and waxy appearance. The mica is usually Muscovite white silvery scales or biotite or lepidomelane (magnesian mica dark in colour.) The quartz, when in colourless crystals, is pure silica, but is frequently coloured. It surrounds the other ingredients like a wrapper, the mica and felspar being embedded in it. Granite is one of the most valuable of building stones, its hardness and compactness of texture rendering it able to resist in a high degree the action of rain and the indestructibility of its material towards chemical agents making it only slowly acted upon by the atmosphere. Small grained granite is the best, as it can be more easily and evenly worked and will weather better. Of its ingredients the felspar is usually the first to show signs of decay, the alkali and some silica being dissolved away, and clay being formed of the different varieties of felspar. Orthoclase or potash felspar wears most rapidly. The mica becomes in time yellow and soft. The quartz resists for a much longer time the action of wind and rain, and often stands out in relief on the surface of the stone. The weathering action is not always confined to the surface, but in the case of granites of little cohesion, is carried often to considerable depth by the soaking in of the rain. It has been known to be decomposed to the depth of over 50 feet in Dorsetshire, in England, where it is dug out of the earth with a spade, and extensively used in the manufacture of pottery.

Sulphide of iron is often found in crystals in granite. When this is in the form of ordinary yellow cubical pyrites, it appears to be harmless, but the sulphide is often found as white radiated crystals, known as marcasite. This substance weathers quickly, and is a most dangerous substance.

Syenite, in its geological sense, is in reality a syenitic granite in which the mica is replaced by hornblende, a silicate of lime and magnesia, the quartz being in considerable quantities, and gradually disappearing as it approaches true syenite in composition. Syenite has a somewhat higher specific gravity than granite. It has been formed under similar conditions, often erupted amongst metamorphic rocks.

Volcanic rocks, or trachyte, are often used as building stones. Trachyte consists chiefly of lava. The Victorian bluestone is a basalt rock.

Sandstones are simply sand, cemented together by different substances, usually quartz and calcium carbonate. The weathering properties of sandstone depend upon the cementing material. The colour is usually caused by the presence of iron. They exhibit often distinct beds of stratification, along which they have a tendency to split. Such rocks split in this way are called flagstones, and are used for paving.

Freestone is a name applied to any rock easily worked by a tool. Sandstone should effervesce feebly with acids; should not weigh less than 130 lbs. per cubic foot, nor absorb more than 5 per cent. of water in twenty-four hours.

Calcareous rocks include limestone, marble, chalk and such rocks as mainly consist of calcium carbonate. Limestones are compact rocks, of which there are many varieties. They are sedimentary rocks of aqueous origin, and contain usually fossil remains. Some are entirely made up of fossil shells bound together by cementing materials. Chalk is a soft pure variety of limestone.

Marble is a crystalline form, and has been formed from limestone by the action of great heat in a confined space, which does not allow of the escape of CO_2. It is highly crystalline and takes a high polish, which renders it very valuable to resist atmospheric influence.

Dolomite is a limestone where the lime has been replaced by magnesium, and consists of magnesium carbonate.

Sandstones and limestone are sedimentary rocks, and have been deposited by the action of water. Limestones are the most valuable rocks, as they not only form excellent stones for building, but furnish the basis of the different forms of mortar and cement. They are classed as compact or granular, the former occurring chiefly in carboniferous and in the lias, the latter being chiefly found in the lias.

The following points are of importance in the choice of a stone for ordinary work. The weathering power. That is, the extent to which it will resist the action of the weather. The weathering power of a stone is dependent upon its physical structure, its chemical composition and the nature of the atmosphere in which it is placed. The same stone will weather very differently under different atmospheric conditions. The most dangerous enemy that the stone has to contend against is rain, or a moist atmosphere. The air of towns is charged with carbonic acid, and in manufacturing towns is further loaded with hydrochloric and sulphuric acids. These acids are dissolved by the rain, and introduced by its means into the stone, penetrating more or less, according to the physical structure of the material. Even the oxygen of the air may act injuriously, notably on such stones as contain iron in the ferrous state. Under the combined action of air, moisture and carbonic acid, the ferrous iron, by a process of which I shall have occasion to speak later on, becomes oxidised and converted into ferric hydrate or rust, which form crumbling portions which are washed away by rain. This oxidation is sometimes accompanied by sufficient heat to cause expansion and consequent disintegration of the stone, as is notably the case with certain shales which contain pyrites. The pyrites are oxidised and converted into sulphate, and when such shales are moistened, they become hot and crack and crumble. Spontaneous ignition of coal in ships is thus caused. As I said, this is strongly marked in the case of stones containing iron in the ferrous state, the consequent oxidation causing the stone to become yellow and even red. This is noticeable in the Pyrmont stone known as Best Block, which assumes a fine yellow colour on exposure. In this case the change appears to be harmless, and increases the value of the stone rather than otherwise, as it gives the buildings a more beautiful appearance. The quantity of CO_2 in air varies from between 0·03 per cent. in fresh country air, to as much as 0·14 per cent. in dense fog in town. Under ordinary conditions, the quantity CO_2, in populous towns, in the absence of fogs, may rise as high as 0·08 per cent. (Dr. Russell.)

The action of carbonic acid upon carbonate of lime is to form a double carbonate which is soluble in water and washed away by the rain. Stones that are rich in calcium carbonate are therefore the most readily decomposed by rain or moist air charged with carbonic acid. It is found that the limestones are attacked by the small quantities of CO_2 found in the air of the country. The sulphuric and hydrochloric acid introduced by the agency of water exercise a similar solvent power, forming soluble sulphates and chlorides which are dissolved out, and these gradually disintegrate the stone. A further action of sulphuric acid is the formation in the pores of the stone of sulphates, which on the evaporation of the water crystallise out, and in so doing expand with irresistible force, and detach fragments of the stone in the process. A similar action, and one to which I need only refer here, is the action of frost, since it is not a re-agent that need be taken into account with us in Sydney, at all events. The water soaked up in the interior of the stone, under the influence of frost is converted into ice, and in so doing expands in the same manner as the sulphate, and breaks off fragments of the stone.

It is obvious from all that has been said above that a moist climate is more trying to a stone than a dry one, as the rain or moisture introduces the deleterious acids into the stone which would not be attacked by them in the perfectly dry atmosphere. And, further, that those stones which consist mainly of carbonates may be expected, other things being equal, to weather less well than those of which the indestructible substance, silica, is the main constituent. By this I mean that the structure of a block of granite may be expected to weather better than a block of limestone of nearly the same physical structure and exposed to the same atmosphere. A block of polished marble will resist the action of atmospheric agents as well, and often better than granite.

High wind is a dangerous enemy to a stone, as it blows sharp particles of dust against the surface, keeping up a continual bombardment, as it were, before which the hardest stone must in course of time gradually crumble. It also forces the rain further into the interior of the stone, and consequently exposes a larger portion to the disintegrating action. On the contrary, a gentle breeze is favourable to the preservation of the stone by drying out the moisture and causing it to evaporate. The warmth of the sun has a similar action in causing the evaporation of the moisture; though no doubt the alternate expansion and contraction of the stone caused by the heat of the sun and the removal of that heat has a slight though barely perceptible disintegrating action.

It is a matter of common observation that those portions of a building that are protected from the sun and breeze (such as the under surfaces of projecting mouldings) are especially liable to decay. This is due to the fact that the moisture accumulates at such points, and the evaporation being very slight, is retained there for a long time.

The physical structure of the stone is perhaps even more important than its chemical constitution as an index to its capability of standing the weather. Many substances of the same chemical composition are very different in physical appearance. A good example of this you have already had in the substances chalk and marble, both of which are composed of pure calcium carbonate. Chalk is friable, easily broken, and comes off on the fingers. Marble is a hard, dense, crystalline, homogeneous stone, not only resists most effectually the erosive action of atmospheric agents (that is the mechanical bombardment I have spoken of above), but is not exposed to anything like the same degree as a loose and porous stone, to the chemical action of the dissolved acids. The rain is not able to enter the stone so readily, and does not remain in contact with the stone for anything like the same length of time.

It may be taken as a general rule that stones that are crystalline in structure will weather better than amorphous

stones (chalk and marble). The closer and finer the grain, the better. A very porous stone should obviously be avoided for external work. Sandstones exhibiting distinct lines of stratification are very liable to wear, having a tendency to split along the lines of stratification. I have said enough to show that the physical structure of a stone is as important as its chemical composition in its choice. Other properties that determine the fitness of a stone for special work are the ease with which it can be worked with the tool, its strength, weight and appearance. These I will not speak further of, as they depend upon the sort of work for which the stone is to be used, the weight it has to bear, &c., and depend upon the practical working details.

The hardness of a stone is of course an important point. Stone used for exposed work should be hard, to be able to resist the mechanical bombardment of the weather. As a rule, therefore, the harder a stone is the better, provided that it can be readily worked. Hard stone is especially important for dressing, &c., wherever a sharp angle or arris is to be kept. It does not always follow that a soft stone will not weather well. Some limestones which are quite soft when freshly quarried acquire a hard surface on exposure, which is due partly to drying, *i.e.* escape of the quarry damp; partly to a slight decomposition taking place in exposure, which removes the softer particles. A well known example of this is the stone known as Bath stone. Neither of course do the hardest stones always weather best. Here again a knowledge of the chemical composition is of the greatest importance.

From our knowledge of the composition of our building stones, and the ingredients which possess weathering properties, we are able successfully to imitate natural stones. These artificial stones depend upon the formation of different insoluble silicates.

Ransome's stone may be taken as typical of such stones. It is manufactured by mixing dried sand with sodium silicate; the mixture is formed into blocks, and the blocks are immersed in calcium chloride, which penetrates the mass. On drying, this stone is found to be as hard as most building stones. The hardening depends upon the power of the calcium to combine with the silica present, forming an insoluble hard calcium silicate. Such stones are as good as most building stones; they have a fine homogeneous structure, and may be moulded with great ease into any form. They are especially useful for ornamental dressings.

Victoria stone is made by moulding finely powdered granite and Portland cement into blocks, and immersing them in sodium silicate. The calcium in the cement combines with the silica.

Mortar.—Lime does not occur free in nature—a fact readily accounted for by its powerful affinity for water and carbonic acid, by which it is converted into calcium carbonate. In this form it occurs abundantly in the secondary and tertiary formations, as limestones, chalk, marble, &c. The purest form of calcium carbonate is Iceland spar or arragonite. As a rock, the purest form is white marble, coloured marble being contaminated with iron, manganese and carbonaceous matter.

If $Ca\ CO_3$ be heated to a high temperature, it is decomposed; CO_2 is driven off and calcium oxide or quicklime results. It is important that CO_2 thus given off should be carried away at once. We have already seen that if strongly heated in confined space that does not allow of the escape of CO_2, it is not further decomposed, but may assume a crystalline structure. We have already seen that the formation of marble is due to this sort of action. The burning or calcining takes place in kilns of different structures, of which I shall not say anything further here than that they are formed on two models, the continuous and the intermittent process. In the continuous process the kiln is formed in the shape of an inverted truncated cone charged with alternate layers of limestone and coal. The lime as it is calcined sinks through the shaft, and is let off at the bottom, a fresh charge of coal and limestone being introduced at the top. In the intermittent process the stone broken into lumps is placed in a sort of arched fireplace constructed of brick and heated by burning coal below, only the flame being in actual contact with the stone. When the whole has attained the requisite temperature the kiln is allowed to cool down and the lime is removed.

The question as to which sort of kiln should be employed is one greatly dependent upon local surroundings, the quantity of fuel at command, and the quality of the lime required. By the use of the continuous kiln the quantity of fuel is greatly diminished; on the other hand, the lime obtained by this process is never so thoroughly burnt throughout, and is consequently usually inferior to the lime obtained by the intermittent or flare-kilns, as they are termed, the extra expense of the coal being largely compensated for by the superior quality of the lime. These flare-kilns frequently require re-lining. Whatever kiln is used it is important that the temperature should be uniform, and very much depends upon the kilnsman, who is able to judge if the temperature is correct by the appearance. Pure lime when heated has a peculiar luminous appearance. This luminosity is a guide to the kilnsman that the calcining is complete. Especially if the limestone contains siliceous matter is this important, for at a high temperature the silica enters into combination with the lime forming calcium silicate, which readily fuses and forms a glass over the surface. Such lime is said to be dead-burnt, and slakes very slowly. The limestone should not be too dry when introduced into the kiln. The moisture when converted into steam no doubt mechanically assists in carrying off the carbonic acid generated. It also forms a hydrate with the lime, expelling carbonic acid. This hydrate, on heating again, loses water or steam, which attacks fresh portions of the marble, and acts, in a manner, continuously. Care must also be taken to insure a thorough passage of air through the kiln, otherwise the Co_2 does not escape, and the result is an imperfectly burnt lime. We have already seen the result of subjecting $Ca\ Co_3$ to a high temperature without allowing for escape of Co_2.

The chemical processes that occur in the process of calcining are simply the expulsion of carbonic acid and water—$Ca\ Co_3 = Ca\ O + Co_2$. The lime obtained has the composition $Ca\ O$—calcium oxide, which is purer the more nearly the limestone approaches the composition of $Ca\ Co_3$. A gradual heat is necessary, as the gases evolved are given off with such violence as to shatter the stove. The temperature of the burning is dependent upon the composition of the stove. A low temperature is sufficient to expel the carbonic acid and water from the purest limestones, those containing clay requiring a stronger heat, care being taken to avoid vitrification. The presence of iron appears to lower the temperature required for calcining. Limes that have been over-burnt or under-burnt both slake with difficulty from opposite causes. In the case of over-burnt lime the inability to slake is due to the presence of the glass of Ca silicate. In the cases of under-burnt limes it is due to presence of uncalcined carbonate.

The lime obtained by the above process of calcining is a white hard substance, which has the power of absorbing water with great avidity, which process is known as slaking. When a lump of such lime is moistened with water it becomes hot, cracks and crumbles to pieces, forming what is known as slaked lime or calcium hydrate. The heat resolved is considerable in the case of pure lime, and is sufficient to set fire to gun-cotton. [The lecturer here made this experiment.] It has been made use of in loosening coal in fiery mines. The seam is bored 3 feet long by $2\frac{1}{2}$ inches, an iron tube $\frac{1}{2}$ inch diameter is then introduced and surrounded by compressed lime; water is poured through the iron tube, and the lime very soon begins to slake, the heat evolved being sufficient to crack and dislodge the coal. When slaked lime is made into a paste with water, it sets in a short time into a solid mass, and it is this principle which is taken advantage of in making mortar. This mass however gradually cracks and shrinks and falls to pieces, owing to want of cohesion between the particles. For this reason sand is invariably mixed with the lime, the lime and particles of sand cohere together, thus preventing shrinking and forming a homogeneous mass.

Correspondence

Architecture—A Profession or an Art?

SIR,—It seems rather strange to me—a not very young architect—that it should be thought necessary to go to the public journals to discuss a subject of this kind, in which the general public, with its present very small degree of art knowledge, can take but little interest. Unless Mr. Shaw and his friends think an association of any kind unnecessary for the artist, and that he must be free as the air if he is to do any good, I think their time and energies would be better spent in trying to persuade those with whom they cannot at present agree to fix upon a new organisation, with rules sufficiently simple and liberal that all the members of the different architectural societies now existing could join together in forming one strong association. Such an association would not put an end to personal differences of opinion, nor would it be at all desirable that it should do so if it were possible. Variety of opinion always will exist, and one of the benefits of the public organisation of universities and colleges is that individual learning, new discoveries, and what at first appear like strange opinions, are presented to us in the best manner possible, rendering the appeal of individuals to the public journals on comparatively unimportant matters of detail as unnecessary as it is undesirable.

Architecture is the first and noblest of the arts. It employs all the crafts and mysteries known for centuries past. Man no sooner appeared upon the earth than he built cities and towers.

Strange then it is that architects are not so well organised as any other important public body. There is no such thing as a College or University of Architecture. Consequently the public, by whom and for whom they exist, take no interest in their sayings and doings. They cannot understand them. If it should be attempted, the great advantage aimed at in any new departure should be, among other things, their education by means of interesting popular lectures, exhibitions, soirées—and though last not least—banquets. If the Academy of the Engineers, who find their advantage in showing hospitality to the public, can find interesting subjects to talk about to the entertainment of their guests, why not the architects, who have been busy creating wonders ever since the beginning of the world, and have always noble works to show, and whose business to day, as ever, is with the fine arts, the sciences and letters? The field for eloquence is simply vast, and doubtless if this proposed change can be organised, the day would soon return when princes felt it an honour to be the patrons of the architect and were fond of building magnificently.

But to conclude. As we all know, there have been bitter complaints about the organisation of the Royal Academy as well as the Royal Institute of Architects and the Architectural Association. Would it not be a noble result for the leading men of these and other cognate societies to meet together in a conference and establish a single Institution—call it the National or Royal University of Arts, or what you will—the laws of which should be so wise and simple that every artist and craftsman would, as a matter of course, naturally find his place under its roof? Then would our friend Furniss rejoice and be at peace. If something of this kind could be done it would be equally to the benefit of the public and the artist. A very small expenditure of money would be required, as the existing buildings would probably be sufficient. It is simply a matter of improved organisation—of a new Royal Charter—and wisely and liberally performed, would be equally a blessing to the British artist and an advantage to English art.

The one great essential of the new institution should be that all its ways and doings be open to the public—that its constitution be based upon popular as well as aristocratic support. With such an institution in evidence, it would be unnecessary to appeal to the press to settle such questions as "Architecture—A profession or an art?" PHIL-ARTES.

The Manchester Society of Architects.

SIR,—Your "Notes and Comments" of November 27 contain some reflections upon the status of the Manchester Society of Architects. As president of the junior society in Manchester at the date of its fusion with the senior society and as one who has taken an active part in the negotiations which have recently terminated successfully, will you kindly allow me space to take exception to the terms of the article above mentioned, the general tone of which, if left unquestioned, is calculated to injure the cause of architectural education in Manchester, and to give offence to those who, of their own initiative, have been the means of bringing about an amalgamation which has produced one of the strongest architectural societies in the provinces.

It must be remembered that the Manchester Society of Architects, founded about twenty-six years ago, consisted entirely of architects who had been in practice for not less than three years. It necessarily followed that so far as their own members were concerned, the question of training or education never has been one of the objects of its existence. At the same time, apart from many good works upon which it is needless for me to dwell, it has been mindful of its obligation to the students of architecture in our midst, and has awarded many valuable prizes gained in competition, also a travelling studentship. The junior society has also received substantial help in many ways from individual members of the senior society. For these some gratitude should be shown by those who have the true interests of architecture at heart, and I would further urge that the labour they have bestowed upon the reconstruction of their society, so as to combine both fellows, associates and students—in fact, to combine all those who are interested in the development of architectural knowledge—should be recognised in a far different spirit from the one pervading the article in question.

In your concluding remark you say that "with wise management the re-formed society will no doubt be able to render some service to the profession." I am convinced it will, that its career of usefulness will be very much extended, and that the educational work will be carried on in a more efficient and systematic manner than it has been done by the junior society in the past; but much of the voluntary labour required to bring this to a successful issue will necessarily devolve upon those who, if treated in the unappreciative spirit of your article, might be alienated from us. Any such proceeding would have a most disheartening effect upon the newly-constructed society, and I therefore ask you to insert this letter in the hope that all cause of offence may be avoided, and that we in Manchester may work in harmony for the good of the profession.—Yours faithfully,

THOMAS CHADWICK.

28 Faulkner Street, Manchester:
December 9, 1891.

Winter Needs: Funds and Friends.

SIR,—As during the nearly fifty years of its existence the Ragged School Union has built many new schools and mission-houses, it has had not a little to do with architects. Its relations with them have always been of a pleasant character, and it owes not a little to their kindness and skill. I should now like them to assist us in meeting the winter needs of the 50,000 poor children attending our 200 local centres. Those needs are food, clothing and bright entertainments. To satisfy them we are in want of money. No sums are too large or too small. They can reach us in the shape of individual offerings, or as the result of collections in offices, on works, and wherever men congregate. I should also like to say the Poor Children's Aid Society is now incorporated with this Union; also that our offices, long at Exeter Hall, are now as below.—Yours obediently, JOHN KIRK, Secretary.

Ragged School Union:
37 Norfolk Street, Strand, London, W.C.

NEW BUILDINGS.

Birmingham.—A mission-hall in Ellis Street, built by the congregation of the church of St. Thomas, was opened on December 5 by the Bishop of Coventry. The building comprises the hall, which will seat between 350 and 400 people, two entrance porches, classrooms or vestry, kitchen, storeroom for chairs, heating chamber, &c. The cost, including furniture, &c., has been about 1,300*l.* The architect is Mr. F. B. Osborn, and the builders Messrs. Hopkins & Son, Birmingham.

Cardiff.—A new building is being erected in Park Place, Cardiff, which, when completed, will be the home of the South Wales Institute of Engineers and the offices of the South Wales and Monmouthshire Coal Owners' Association. The building is of red bricks from Ruabon, with red stone dressings from the Shawk Quarries, near Carlisle. On the basement the heating chambers are located, and a well-lighted "specimen room" is provided, which will be used as a small museum. The ground floor has been arranged for the Institute, and contains a library, 38 feet 6 inches by 22 feet; a writing-room, 18 feet 6 inches by 22 feet; secretary's office, and a lecture theatre, 40 feet by 42 feet. The first floor, which has been devoted to the use of the coalowners, contains a conference-room, 38 feet 6 inches by 27 feet 6 inches, a committee-room and a smaller room, in addition to a suite of offices for the secretary. Mr. E. W. M. Corbett is the architect, and Messrs. Wm. Thomas & Co. the contractors.

GENERAL.

Sir Frederick Leighton, Bart., president of the Royal Academy, and Mr. Eaton, secretary, have just had an audience of the Queen, and submitted to Her Majesty the business of the Royal Academy.

Mr. Catterson Smith has been selected as secretary of the Royal Hibernian Academy of Arts, in place of the late Mr. Colles Watkins.

The Dowager Viscountess Galway has bequeathed to the Nottingham Castle Museum twenty-two original drawings in chalk and water-colours by great masters, including Giorgione, Geurcione, Guido Reni, Paul Veronese and Claude Lorraine; two frescoes on wood, and eleven marble and stone roundels, carved with figures and animals.

A Reredos, designed by Mr. Jethro A. Cossins, of Birmingham, has been placed in Holy Trinity Church, Leamington.

It is proposed to raise a fund for the purpose of providing in Carlisle Cathedral a memorial of the late Bishop Goodwin.

Sir John Maclean, F.S.A., of Clifton, author of "The Hundred of Trigg" and other valuable works, has been appointed president of the Royal Institution of Cornwall, his native county.

The Local Government Board have given assent to the application of the Croydon County Council for permission to expend the sum of 70,000*l.* in the erection of new municipal buildings. The work will be taken in hand almost immediately.

A Proposal is on foot at Glasgow to establish a hospital in the vicinity of the city for consumptives. The offer of a sum of 500*l.* to head a subscription-list for this purpose has been received.

The Architect.

THE WEEK.

THE first stage of the competition for the proposed Art Gallery in Glasgow has been passed. The six designs which will form the basis of the second competition are the following:—No. 9, Messrs. MALCOLM STARK & ROWNTREE, 189 St. Vincent Street, Glasgow; No. 17, Mr. THOMAS MANLY DEANE, of the firm of Sir THOMAS N. DEANE & SON, 3 Upper Merrion Street, Dublin; No. 25, Messrs. TREADWELL & MARTIN, 2 Waterloo Place, Pall Mall, London; No. 30, Messrs. JOHN W. SIMPSON & E. I. MILNER ALLEN, 10 New Inn, Strand, London; No. 40, Messrs. JOHN HONEYMAN & KEPPIE, 140 Bath Street, Glasgow; No. 48, Messrs. JOHN HONEYMAN & KEPPIE, 140 Bath Street, Glasgow. It will be observed that Messrs. HONEYMAN & KEPPIE have won a double chance, and, whatever may be the final result, their success in the first competition is remarkable. The committee being advised by Mr. WATERHOUSE that it would be inexpedient to exhibit the six selected designs, an opinion in which the architects concur, have resolved that, under these circumstances, the exhibition of the designs be delayed till after the final award, when, with consent of the architects, all the plans lodged will be placed in a convenient building for the inspection of the public.

AT the dinner of the Society of Engineers on Wednesday the president, Mr. COLAM, said he thought that the ever-increasing success of the Society of Engineers was mainly due, firstly, to the care which was bestowed in the selection of papers read and the opportunities given to the younger members of the profession to take part in the discussion; secondly, to the summer visits of members to works of engineering interest, at which opinions are freely exchanged with great mutual benefit; thirdly, to the honorary secretary and treasurer, Mr. ALFRED WILLIAMS, whose long experience, common sense and watchfulness was invaluable; and fourthly, to the energy and tact of the secretary, Mr. PRYCE-CUXSON. During the last year the increase of membership has been about 8 per cent., and the attendance at meetings about 5 per cent. Mr. J. W. WILSON was elected president for 1892, and Messrs. VALON, GOODWIN and ANDERSON as vice-presidents.

THERE are so many signs of rigorous discipline in Berlin, nobody can be surprised at the regulations for the use of water which are enforced in the city. In 1865 the charge for water was determined as in London, by the rent of the house where it was used, but gradually a more exact method was employed, and by 1878 the sale was exclusively by meter. The objections to the meter system do not, it appears, apply to Berlin. As might be expected, the system has come into favour in other German cities, and according to an official statistical table, referred to at the Institution of Civil Engineers last week, and which related to water supplies of 7⅝ millions, for the inhabitants of 77 German cities, in 26 per cent. it was apparent that the sale of water was exclusively by meter, and the control by meter of a considerable proportion of the remainder had been adopted. It was conceded that the great stringency with which the various Governments enforced the laws for the protection of the streams against pollution had promoted the adoption of the system, which was first introduced in Berlin.

THE annual meeting and dinner of the Royal Institute of the Architects of Ireland took place on the 12th inst. At the meeting the president, Mr. THOMAS DREW, R.A., gave an address dealing with the contrasts of architectural practice in 1891 and 1839, when the Institute was founded. A most agreeable concert was organised by some of the gentlemen of the choirs of the Dublin cathedrals, with both of which the President is connected as honorary architect. The programme opened with HAYES's old round, "Wind, gentle evergreen, to form a shade, Around the tomb where SOPHOCLES is laid," familiar to A.A. excursionists at many past annual dinners. In Dublin the art of dining out is traditional, and, in spite of the prevalence of discord, there is genuine musical talent available on such occasions. The Royal Hibernian Academy dinners with the double quartette singing of the amateur "Strollers" are already famous. The madrigal glee company of professional guests organised by the President of the Institute, is a good example as an aid towards the enlivenment of all inevitable professional dinners. Members of the choirs, with the President, contributed the part singing and some well chosen solos, and the members of the Institute, among which there is a considerable share of musical power, bore a part in carrying out a tuneful evening.

THE artists and amateurs of Dijon appear to have more respect for an official architect than is common in French towns, for they have elected M. CHARLES SUISSE, one of the Government architects, as President of the Société des Amis des Arts de la Côte d'Or. It has been decided to have an exhibition of paintings, architectural drawings, water-colours and works of sculpture in Dijon during the coming year, and it is to be hoped the new President will be able to rely on the co-operation of artists. M. SUISSE made a complete set of measured drawings of the cathedral of Dijon, which were exhibited this year; the French Government purchased them for the archives of the Historic Monuments Commission.

THE Executive Committee of the fund for providing a memorial to the late Field-Marshal Lord STRATHNAIRN have entrusted the commission for a bronze equestrian statue of the Field-Marshal to Mr. ONSLOW FORD, A.R.A. Great difficulty has been experienced in procuring a suitable site, and much time has been spent in approaching the various authorities for permission and obtaining their negative replies. The only site which now remains is at Knightsbridge, at the junction of the Knightsbridge and Brompton Roads, and the Westminster Vestry are prepared to give their assent to the erection of the statue there. Sir FREDERICK LEIGHTON, P.R.A., has approved of this site. Some of the subscribers were in favour of an alternative site in Belgrave Square, at the junction of Grosvenor Crescent and Halkin Street, but the St. George's Vestry vetoed it. The Knightsbridge site has been adopted by a considerable majority.

THE New York Superior Court appears to have a remarkable notion of the responsibility of architects. Some nine years ago, says the *American Architect*, a Miss JARVIS was sitting at the front window of a house on West One Hundred and Twenty-eighth Street, when a wall which had been built on the next lot fell over upon the house in which she was, and a mass of brick and mortar crashed through the roof and upper floor and struck Miss JARVIS, and injuring her severely and permanently. The girl's father sued the owner, Mr. CHARLES BAXTER, the architect, Mr. CHARLES H. FENTON, and the builder, jointly, for damages for the injury to his house, and, in his daughter's behalf, for further damages for her personal injuries. In both cases he obtained a verdict in his favour, the damages being fixed at 2,500 dols. in each case, or 5,000 dols. in all. The testimony went to show that the mortar used in building the wall was bad, but it seems rather hard to hold the architect and the owner responsible for this, which was probably a violation of the contract by the builder. However, as was once said by a Supreme Court judge in a similar case, a defective wall or structure is to be regarded in the same light as a dangerous beast. If the beast escapes and bites the public, all those concerned in keeping him tied up are jointly responsible for the damage he may do; and, while the architect and owner may not have caused, or even known, the vicious disposition of the wall, they should see, at their peril, that it is kept where it cannot, in any case, lay its claws on the neighbours.

ACCORDING to the official statement a sum of 24,064,000 francs, or say one million sterling, has been expended already on the church at Montmartre. It would be difficult to discover a building which, at first sight, presents a less satisfactory result for so large an outlay. It appears that 5,000,000 francs are required to complete the works in masonry. Painted-glass, decoration, altars, mosaics, frescoes and sculpture will have to be arranged for at a subsequent time. At present the services are conducted with inconvenience to all.

THE ADDRESS AT THE ROYAL ACADEMY.

[By a Correspondent.]

As the eloquent periods of the President have naturally, and very properly, great importance attached to them, and as, notwithstanding their charming effect upon his audience, it was impossible not to feel that there was an unsatisfactory lacuna and logical incompleteness in them, it is a duty for English architects—the objects of the address—to take note of it. It is true that he was talking to *students*, but, old or young, we are all students, and those of the Academy are not mere boys. We must assume that they are reflective beings, and, therefore, he who addresses ideas to them, or withholds information from them, accepts a position of very great responsibility. What was that position? Are we to think that the President has, advisedly and designedly, taken one of the cleverest and most important moves of the last half century for the vital advancement of modern architecture—to breathe life into a thing now dead?

French Gothic architecture of the thirteenth and fourteenth centuries is presented to our admiration in the most eloquent terms as a brilliant racial product, as if it were the beginning and end of all art. Its decline and extinction are noticed, and so is the Classical revival—the Renaissance. That is all. We have heard it all before, only in less beautiful language. But assuredly the President of the Academy cannot have taken the trouble of delivering an address for nearly two hours for the mere sake of indulging in the eloquence that seems to come so naturally to him. No; he would be the first to condemn and spurn such barren work, and as it is sometimes quite possible to know what men think by what they do not say almost as well as by what they do say, we may conclude that he is in perfect harmony of opinion with another late eloquent lecturer of the Academy, viz. that the glorious architecture of the thirteenth and fourteenth centuries should be adopted as the starting-point for modern work, because now, as then, it would be found capable of adapting itself to every new want of our ever-advancing civilisation. Like him, he has no stomach for the present fashion of copying debased buildings—for the ludicrous attempts to revive what were only bad imitations of Italian Renaissance structures. Well, if so, the President would have a very sufficient, numerous, and powerful following to start the new departure, and if his eloquence has had any lasting effect upon the students gathered round him on the Thursday (Dec. 10), we shall be coming within clear view of a new and perhaps glorious epoch in art. All that Sir Frederick Leighton says, however, in honour of the French builders and adorners of cathedrals is equally due to the English architects of those days—nay, rather there is historical evidence that Englishmen led the way in the general movement in art.

The grand front of Wells Cathedral, with its magnificent array of sculptures, was built in 1204 by Jocelyn Trotman, a bishop who was consecrated by King John at Reading in 1206, and who died in 1242. But the first stone of Rheims was only laid by Robert de Coucy in 1211. The works at Canterbury had been going on from 1125 to 1220, when William, "the Englishman," completed Becket's Crown to the general admiration, and great works were in progress at York and at St. Paul's Cathedral, London, at the same time.

"It is very remarkable," says Flaxman, "that Wells Cathedral was finished in 1242, two years *after the birth of Cimabue*, the restorer of painting in Italy; and the work was going on *at the same time* that Niccolo Pisano, the Italian restorer of sculpture, exercised the art in his own country, and it was finished forty-eight years before the cathedral of Orvieto was begun; and it seems to be the earliest specimen of such magnificent and varied sculpture united in a series of sacred history that is to be found in Western Europe."

D'Agincourt, says Niccolo (who was an architect as well as a sculptor), was born about 1200. The late Professor Cockerell considers the glorious sculptures at Lincoln Cathedral fully equal to the best Italian works of the thirteenth and fourteenth centuries. They were commenced 1256 and finished 1282.

Thus, while we have no wish to detract from the President's eulogium of the French race, we claim that Englishmen in the thirteenth and fourteenth centuries were not only its worthy rivals in art, but were characteristically leading rather than following.

If French ecclesiastical architecture of the thirteenth century had "its nice poise of mutually counteracting forces," so had English cathedrals of the same period. If "no one who has not seen, as one still may see in France, a cathedral of which the glass is preserved throughout, or nearly so, can form an idea of the effulgent magnificence and poetic charm which attach to this flinging of a heaven of colour about the majesty of the house of prayer," he has only to visit the Minster at York, if Westminster Abbey, owing to its comparatively small size, does not satisfy him. He will there find windows "limpid with hues of amethyst, sapphire and topaz, and fair as a May morning," or "deep and fervid as a midsummer night," and all made, not by men of the French, but of the English race.

Alas that times—that nature itself—should seem to be so changed! Perhaps the object of flashing the glorious achievements in architecture of the French race before the minds of young Englishmen, without a word about the splendid works of their ancestors, was to provoke them to take no rest till they have established a national school of architecture and the subsidiary arts, which will teach that clever draughtsmanship applied to copying old buildings is not architecture at all, though it is the fashion of the present time to accept it as such. Whether, as I supposed at the outset, this or something like this was in the mind of the President of the Royal Academy of Arts when addressing the students is, of course, uncertain; but assuredly it is a scheme the furtherance of which would be worthy of his brilliant powers and influence.

THE SYDNEY (N.S.W.) ARCHITECTURAL ASSOCIATION.

When writing lately about affairs in connection with the new hospital in Sydney, we mentioned a few circumstances which must have suggested the desirability of many changes in the practice of architecture in that distant capital. It was evident from what was revealed before the Parliamentary Committee that the competition system appears in Sydney under its worst aspects. In order to gain a public commission discreditable expedients are practised, and in consequence people have lost faith in architects. It was admitted by one witness that officials treat them with the contempt which is bestowed on the waifs and strays of humanity that are drifted to New South Wales. The hospital case, however, affords an opportunity for no more than a glimpse at professional life in Sydney, and it may well be feared that, if more could be known, the appearance of things would not become more attractive. That it is never too late to mend is an accepted doctrine in Australia, and it is possible that by this time many have become ashamed of tactics that seem to be derived from bush-rangers, and there is a more civilised recognition of the rights of others. But the young men who are to be the architects of the future have done well to take care of their own interests. They have set up a society in which conduct will count for something. The London rule has been widened, and if "the conduct of any member" (evidently other lapses besides those of professional practice are regarded) is considered to be derogatory to the Association the procedure for expulsion will be commenced. An association which will afford facilities for the study of civil architecture, advance the profession and serve as a medium of friendly communication between the members and others interested in the progress of art, has advantages wherever pupils and students are found, but there are many causes which concur to make one of the kind most apposite in Sydney at the present time. We hope it will be successful, and that the example of the members will have a beneficial effect upon those more ancient practitioners who are recalcitrant to modern ideas of business.

The Sydney Association is under the presidency of Mr. S. Hurst Seager; the vice-presidents are Mr. G. J. Oakeshott and Mr. G. D. Payne, and the secretaries are Messrs. Harold O. Jackson and J. P. Power. It is difficult to organise a society of the kind without the help

of time, but although the Association is not a year in existence, it appears to be already in working order. There are junior and advanced classes for construction and design, meetings at which papers are read and discussed, exhibitions of drawings, visits to buildings, a library, and a publication in which the progress of the Association is recorded. The lines followed are generally those of the London Association in the old days, and it is satisfactory to find so successful an imitation.

At the first meeting the President warned the members about the effects of indifference to the classes. It appears that in Melbourne "the classes were said to have failed in their purpose through the lack of interest evinced in them." In the construction classes the questions are given out a month before the meeting takes place, and it is expected that they will be systematically worked out. At the meeting the results are discussed. Among the subjects treated have been shoring, foundations, walling, piers, columns, arches, trusses, beams and floors, roof coverings, &c. The report of the last meeting, which is dated September 23, states that four papers were sent, and three supplied answers to all the questions. In the classes of design, the drawings of the subjects assigned are to be in pencil. After criticism by the Visitor, they are to be inked in or neatly finished in pencil. The subjects were not beyond the powers of the members, and include a cottage hospital, a suburban residence, a village school, a village church, a country hotel, a small art gallery, &c. According to the last report, only one design in the advanced class was considered as coming within the sum stipulated for erection, and out of four designs only one was Gothic. In the elementary class, it was said that only one student showed a grasp of the subject, which was a park entrance and lodge. But it is not to be expected that beginners can be perfected in the course of a few months. Styles are specially studied in a class.

The papers read at the monthly meetings are quite equal to those presented at societies' meetings in London or the provinces. In succession to the President's address, Mr. F. W. WOODHOUSE lectured on "Art: its claims as a study in relation to history," Mr. G. T. OAKESHOTT on "Sketching," and Mr. F. W. MARKS on "Five Famous Domes." In addition, Mr. MARDEN, the consulting botanist to the Forest Department, read a paper on "Some Ornamental New South Wales Timbers," Mr. GUTHRIE, F.C.S., on "The Chemistry of Building Materials and Professor WARREN on "Stresses in Constructional Ironwork." We have reprinted Mr. GUTHRIE's paper, which will suggest that the students in Sydney cannot consider themselves to be less favoured in respect of technical knowledge than their friends in England.

The Association would not be worthy of its title if some of the members did not dream of the possibility of creating a style that would represent and belong to New South Wales. Perhaps those ardent youths did not relish the following remarks from Mr. WOODWARD, which are, however, applicable in other places :—

> Much is often spoken and written with regard to the desirability and possibility of creating or inventing a new style, not only of architecture, but of pictorial and decorative art for this new country. Now we cannot bestow even the most cursory attention on the history of art without seeing that a new style "cometh not with observation." No artist or craftsman of old yet said, "Go to, let us create a new style or order." Various men in these latter days have thought to do so, but their inventions have perished or withered away, "because they had no root," surviving only as curiosities—examples of the aberrations of the human mind. No! styles, whether of painting, sculpture or architecture in all their details, down to the lowest, grew as grows the grass of the field, the trees of the forest, silently, surely, unhasting, unresting. In this the analogy with the growth of the speech of mankind is perfect. Even supposing it to be desirable nowadays, is it likely that the genius is to arise here who shall do what it has taken the combined effort of generations of the master-minds of the world to accomplish? Do not conclude that this need act as a discouraging thought. Each has power to do what those master-spirits of the past did, to add each his line, his touch, his thought to the work of his time and country, letting his mind work freely on the material provided by others, not in servile imitation, still less in efforts after originality at any price, but frankly accepting the good, and moulding it to his requirements. It certainly never occurred to the Mediæval craftsman that in selecting the oak or maple in preference to the dogtooth or trefoil he was inventing a new style, and it is not by using the waratah or wallaby, the lyre-bird or flannel-flower, as motives for decoration that we shall create an Australian style; but, if it is to be done at all, it will be by the full expression of our thoughts, our aspirations, our wants, our hopes and fears. If these be noble and beautiful, true and devoid of sham, so also will be our buildings; if servile, mercenary, superficial, ostentatious, then our houses, our banks, our offices, even our churches, will reflect these characteristics of our inmost soul.

It is evident that one of the desires of the officers is the obtaining of precise information upon the building materials of the colony, and in course of time the *Sydney Architectural Association Notes* will be authoritative on the subject. A good example of the kind of paper that helps to attain that end is Mr. MARDEN's on "Ornamental Timbers." From it we find that red cedar has already become scarce, and that replanting has had to be undertaken by the Forest Department in order to provide for the requirements of the future. Rosewood is still obtainable in large quantities in pieces of from 10 to 20 feet in length and 12 to 34 inches in width, the price in the log being 15*s*. per 100 feet. Mr. MARDEN says it works well, shrinks little, and is of good appearance. But Mr. POWER, the secretary, said his experience of rosewood was not satisfactory. It was needed for counter-tops, and he found that it split in seasoning, and out of a supply there was not enough to make one counter-top. American timber had at last to be substituted. The red or black pine was described by Mr. MARDEN as proof against the white ant, but, on the other hand, the timber is brittle and inflammable, and it is impossible to drive a nail without preliminary boring. The chestnuts or beans afford beautiful timber, but the stockowners look on the trees as dangerous to cattle, and cut them down without mercy. According to Mr. MARDEN, the loss of timber wealth must have been enormous. Blackwood resembles American walnut. Tulipwood is valuable for cabinetwork; it has been used for panels in doors and dados, "and with selected pieces the effect may be described as gorgeous." Root stocks, which elsewhere are valuable, are generally neglected in New South Wales, although fine veneers are obtainable from them. But as yet much has to be discovered about the endurance of timbers. In the Penrith Bridge hard but unseasoned woods were used and covered with tar, but they decayed rapidly.

Judging by the work already accomplished, the Sydney Association would appear to have a most useful future before it; and if the energy which now marks the arrangements can be continued the Association is likely to become the foremost architectural society in the colony.

FRENCH ARCHITECTURE.*

By SIR FREDERICK LEIGHTON, P.R.A.

STUDENTS of the Royal Academy,—Pursuing the subject which I have for some years past proposed to myself in these addresses to you—namely, the relation between artistic production and its surrounding conditions—I dealt with it, you may remember, at our last biennial gatherings in connection with two members of the so-called Latin group—the Italian and the Spanish peoples. I purpose to-night to complete our survey of that group by speaking to you of its third member—the people of France.

The task is one which I approach with no small misgiving; in the first place, because the evolution of the artistic genius of the French having been uninterrupted from the days of Charlemagne to the days in which we live, an account which shall stop short, as this account needs must, on the threshold of modern times, can offer but a mutilated picture; and in the second, because that genius, which is in the very life-blood of the race, has found vent over so wide a field that it is not possible within the limits of an address, even though I draw largely on your patience, to do more than indicate in the most summary manner the forms it has assumed and the fruit it has borne. Indeed, I shall be forced to lay stress on one form only of its manifestations, touching but incidentally on others; and the topic on which I shall mainly dwell is one which plainly imposes itself by its paramount interest. Vast, indeed, is the field over which the creative genius of the French has been active; not architecture, sculpture and painting have alone absorbed its energies, every form of industrial production has furnished material for its exercise, and has received its stamp. But among its nobler manifestations there is one—its achievement in architecture in the Middle Ages—to which France owes a position of pre-eminence that until the present century she could not claim in either of the sister arts. Fortunately for our inquiry there is nothing from which we may learn more of a

* An address delivered to the students of the Royal Academy at the distribution of prizes on the 10th inst.

race in its days of spontaneous artistic production than its expression in architecture.

In architecture the French have a supreme claim on our admiration, for on the very dawn of modern days they conceived, and, having once conceived, evolved with an unerring certainty of logical procession and with a swiftness surpassed only by the sudden ripening of Greek sculpture in the fifth century before Christ a style of architecture based on a principle wholly new, not only differing from but directly opposite to that which had governed the builders of Rome and Athens respectively, a style which spread rapidly and triumphantly over the whole of Western and Central Europe, and which has in its unity, its flexibility and its varied splendour found no peer since the days of its decline. I mean, of course, the style which, more rightly spoken of once as Frankish—"opus Francigenum"—is now known by a name given to it at first in scorn, the "Gothic" style. To the evolution of this style and to its gradual supersession in the sixteenth century under the influence of the revival of Classic feeling, I propose to devote mainly to-night such few considerations as the limits of our time admit.

But first let us glance at the composition and at the home of this great unrestful, initiating race. It occupies a broad and fertile region blessed with a temperate climate, fanned on three sides by the breath of the sea, favoured with bright skies and a light keen air, which quickens the wit and gladdens the spirit. In this land is bred a mercurial, light-hearted race—one, now, and united, but built up of varied elements, and for a long time fiercely divided within itself. What are these various elements? As far back as sure knowledge reaches—for of those earliest artists, the aboriginal cave-dwellers, but little can be known—we find the country unequally divided between Celtic tribes and an Iberian race, which latter sat on the slopes of the Pyrenees and was spread over the Spanish Peninsula. Now the Celtic tribes which occupied respectively the north and centre of what was one day to be France represented, speaking broadly, two successive immigrations, the earlier that of the Gauls, the later that of the Cymri, and these two tribes, or groups of tribes, furnished different elements to the national character, the Gaul being the more mercurial and indocile—"Ie Celte indocile" Michelet calls him—the Cymri more staid and open to discipline. Along the southern seaboard the ubiquitous Phœnician—need it be said?—set up his counting-houses, penetrating thence to some distance into the interior. Greeks, too, traded with and colonised the region known to us as Provence, founding Phocæan Massilia in the sixth century before Christ.

The genius of Celtic France was thus early fed and strengthened by foreign elements. "Toutes les races du monde," Michelet finely says, "ont contribué pour doter cette Pandore." Nevertheless, we must not lose sight of the fact that the Gallic stock, of which an unquenchable vitality is the primary characteristic, remained in numbers greatly superior to the foreign infusion, though probably the estimate of Amédée Thierry that nineteen-twentieths of modern Frenchmen descend from them must be taken with much reserve; the Gauls never in their thraldom forgot their blood, and in the great upheaval of 1789 the old undying, smouldering consciousness burst into lurid flame. "For more than thirteen centuries," says Guizot, "the conquered people had struggled to shake off the yoke of the conquering race; our history is the history of that struggle," and this duality within the French race is the key to much that is perplexing in the evolution of its intellectual life. Well, what are the main characteristics of this Gaulish people? They are a love of fighting and a magnificent bravery, great impatience of control, a passion for new things, a swift, brilliant, logical intelligence, a gay and mocking spirit, for "to laugh," says Rabelais, "is the proper mark of man"—an inextinguishable self-confidence; the best French writers, whom I may not contradict, add an excessive vanity. And to this native fund were brought from without modifying elements of discipline and control; we shall presently see with what result. The first centuries of Teutonic dominion have left no traces of artistic activity on French soil; for 300 years art slumbered amidst the din and devastation of intertribal war, but if in these dark days the memory of Roman splendour became dim and all tradition of methods of building was effaced, the unborn genius of the Gallic race ripened during this period of incubation towards a freer, a more personal, and a more vigorous life than would have been compatible with a continuous tradition, and accordingly its initiating force makes itself felt at once on the revival of building.

It was that great ruler Charlemagne who first called architecture out of its sleep. Filled with his large conception of an empire of the west, the heir to the greatness of Rome, his mind turned, as was natural, to the restoration of Gallo-Roman splendour. To this end he called around him artists and skilled workmen from the south and east. The Roman basilica was taken as the model of the new churches which, under his encouragement and with his aid, the monastic communities began to raise through the land, and thus Roman architecture became the starting-point of the new development of the art of building.

Nevertheless, other foreign influences became early active through contact, direct or indirect, with other races. An illustration of the profound modifications which such contact could bring about may be found in a comparison, for example, between the sculptured façade of the church of St. Gilles, in Provence, a region much under Roman and Greek influences, and the church of St. Front, at Perigueux. The latter church was begun, according to Viollet-le-Duc, towards the end of the tenth century, a few years after St. Mark's, in Venice, and practically on the same plan; the former is of much later date, yet the southern example is still strongly impregnated with Classic tradition, whilst the Acquitanian church, with its five domes, is wholly Byzantine in its general character. Here the inspiration is derived undoubtedly from the Venetians, who at an early period had established a trade route through France to the western seas, and had an important mart at Limoges; and it is an interesting fact that during the eleventh and twelfth centuries it is in Acquitania alone—that is, in the province within more immediate touch of Venetian influence—that domical churches were built. Now, both these instances, illustrating as they do in a marked manner the receptivity of the Gallic intelligence, exhibit, also conspicuously, the freedom with which it fashioned foreign elements to its uses. This freedom is almost startlingly displayed at St. Gilles, where Classic material is handled with an audacity which, if leading in some points to an almost barbaric incongruity, produce a result in the last degree impressive and stimulating. The work is thoroughly southern; it has none of that logical and orderly cogency which was already at that date the mark of the work of the Gallo-Franks in the north; but it is a work of true genius, and to me infinitely fascinating. At Perigueux also we find the fire of native genius forming and fashioning material not indigenous. In ground plan, as I have said, St. Front is almost identical with St. Mark's, and in its general structural features has much analogy with the Venetian church; nevertheless, the impression produced—I speak of course of the form, for the colour is now from floor to roof that of stone newly and sacrilegiously flayed and scraped—is wholly different; that love for slender and soaring forms which was to mark French architecture in the future is already evident; forms which in the Venetian model are sturdy and squat are elongated here almost to slimness: the whole proportion, and therefore the whole character is changed; the Venetian idea has been, so to speak, translated into French.

The impulse towards a revival of architecture was, we saw, given by Charlemagne, but it was not till the tenth and eleventh centuries that the movement reached its full force; and its development was due mainly to the great monastic community which, founded by St. Benedict early in the sixth century, had poured from the heights of Monte Cassino its beneficent influence over Western Europe. This famous Order had become a mighty power in France, controlling from the central foundation at Cluny not less, it is affirmed, than 314 monasteries and churches over the face of the country, and had offered in days when the land, half wilderness and half shambles, was given over to fire and sword, a sacred refuge and a stronghold to whatever of refinement, of knowledge and of culture still struggled to live. Under the protection of the Crown the convents long remained the sole centres of intellectual light; and if, in the second half of the twelfth century building passes, owing to the development of municipal institutions, mainly into the hands of lay craftsmen—though under the influence of kings and bishops—it was, nevertheless, in the days of paramount monastic influences that the ogival style was initiated and evolved. Let us see by what steps.

The model first adopted in the greater part of France for the uses of the Christian church was, I said, the basilica of the Romans, with its nave and its aisles, its narthex and its apse; in this model, however, certain modifications were needed to meet the requirements of Christian worship and ritual, or for safety, and out of them grew the type of church known as Romanesque. Of these modifications one, the substitution of waggon-headed vaults for timber roofs—a change made necessary by the frequent occurrence of fires—led to momentous consequences, for it is, as we shall see, in the problems of vaulting that the so-called Gothic style had birth. In the vaulted buildings of the Romans stability was obtained through inert resistance: the solid weight of their vaults was taken up by solid masses of brickwork and concrete—you may, in fact, regard these edifices as virtually hewn out of a solid block.

The substitution of the principle of a balance of active forces to this principle of inert resistance is probably the greatest revolution ever introduced in the science of building; we have here the generative principle of Gothic architecture, its essence and its life. How this revolution was brought about I can, of course, only indicate to you in summary outline. Let us first note in passing that the presence of a pointed arch, except as a

structural form, does not constitute Gothic architecture. Isolated radiating pointed arches have been built in ages and countries in which the Gothic style was not dreamt of; a building might be Gothic in structure and principle without showing a pointed opening anywhere; it is through the roof, not through the window, that the formative Gothic idea entered. Let us try to follow rapidly some of the main steps by which it reached its ultimate development.

The first substitute for the discarded timber roof was the waggon vault thrown first tentatively over the aisles, then over the nave; and here an element of weakness soon made itself felt—the walls of the nave carried on piers, and of no great thickness, were not equal to the outward thrust of the vault, and gave way. Various expedients were resorted to; buttresses were added at the points corresponding with the piers, a transverse band or rib was flung across the nave from pier to pier, the vault from being circular was, in some cases, broken and made pointed, rendering the thrust more vertical, but leaving it continuous. The problem was not yet solved; a counteracting force, in which we see the germ of the flying buttress, had, in certain regions, been applied, namely, a half-waggon vault above the side aisles taking up the pressure of the central vault; but this arrangement condemned to practical darkness the upper part of the nave, which, instead of windows, showed a cavernous gallery. In Acquitania, as we have already seen, a succession of cupolas on pendentives was early adopted—an arrangement which, though, as in the case of the cathedral of Le Puy, it yields grand impressive effects, is in many respects unsatisfying. An important step in the new direction was next taken at Vézelay, where intersecting vaults, but without ribs, were substituted for the continuous waggon-head, the thrust of the vaulting being thus directed to the supporting piles. This arrangement was, however, still found unsatisfactory, and on a narthex being added or rebuilt on a large scale, the same disposition of vaults was retained, but they were made pointed instead of round. A few years later, in the early middle of the twelfth century, a Benedictine monk, feeble of frame, but of a lofty spirit, Suger, the great Abbot of St. Denis—who has on sculptors, by-the-by, this special claim, that he boldly withstood the bitter denunciations launched by St. Bernard against the sculptural decoration of churches—began the erection of a church in which the tentative gropings, at which I have just hinted, gave place to the systematic and logical application of a new and fruitful conception—the idea of stability based on the balance of active forces, expressed in a self-sustaining combination of upright supports and vaulting ribs, with detached buttresses bringing their action to bear exactly on the points at which the thrust of the vaults is gathered up.

So late as the days in which Viollet-le-Duc wrote his great "Dictionary of Architecture" it was believed, and he endorsed the belief, that this far-reaching conception had arisen suddenly and spontaneously in the brain of one man. More recent investigation, in which M. L. Gouse, in his sumptuous work on "Gothic Art," has, so far, said the last word, has brought our knowledge more into harmony with the general analogy of things. To the famous abbot belongs, it is true, as I have said, the honour of the first systematic application of the new principle, and his great work must ever remain a landmark in the history of architecture; but it was, in fact, only the last and most complete of a series of experiments covering a period of nearly half a century—experiments of which the earliest is seen in the church of a benedictine monastery at Morienval. This church is in the heart of the group of provinces called the "Domaine Royal," of which Paris, the seat of royalty, was the centre, and it is within this Frankish region that the various other tentatives to which I have alluded are to be traced; it is in this region also that it reached its fullest development and left its most perfect achievements. External conditions were doubtless favourable to that growth; the wealth and patronage of kings and bishops were propitious to the builders of the day; but to these incentives from above was added another which had a deep and lasting bearing upon the revolution which was taking place in architecture, namely, the development of the communes. This development, fostered not only by the kings but by the bishops, who viewed uneasily the strength and independence of the monastic bodies, gave, by laicising it, if I may use the word, a new direction to the art of building. Cathedrals, not abbeys, were now built—wider and loftier structures, breathing an area of larger freedom and expressing a fuller public life. From this day forward the trammels of antique tradition were wholly cast aside, and whilst French architects constructed in a style born on their own soil, they looked at home henceforth for its decoration in the lanes and fields of their native country. In a tumult of creative energy Gothic architecture leapt to its height in an amazingly short space of time. Between the great reign of Philippe Auguste and that of Louis the Saint nearly all the great cathedrals of France were begun or reached completion.

But, indeed, the epoch was in many ways favourable to a great intellectual movement in France. Paris was in the thirteenth century a famous centre and focus of intellectual activity; the French language was widely known in Europe; Brunetto Latini, the master of Dante, wrote his "Trésor" in that tongue, on the ground that it was beyond all others *délitable et commune à toutes gens*. But if these general conditions of intellectual energy favoured the growth of the new phase of art, the peculiar aptitudes of the race were singularly calculated to promote it. The rise and evolution of ogival architecture is proper, we said, to the Domaine Royal—the north and centre of France. Well, what was the race that occupied this region? It was a race of which the basis was Cymric, formed therefore from the more stable and disciplinable of the two Celtic groups; but on this root, enriched already by a Latin element, was grafted a considerable Teutonic growth, which must of necessity have exercised an important modifying influence. Now, this combination would seem well suited to produce that admirably poised compound which we see in the French genius at its best—a genius which, if it is conspicuous for the restless energy, the fearlessness of intellect, and the eager grasp of new ideas which mark the native Gaul, reveals also a sense of measure, a precision, a sobriety and a balance which point to the chastening influences of other blood.

By the side of these general characteristics, we have to note certain purely artistic peculiarities. There is, for instance, a sense of the decorative in form in which the French have remained unrivalled. But I would draw your attention especially to a characteristic bent which has played no small part in the development of their architecture, namely, a strong leaning to long ascending lines, to slimness of proportion and to perpendicular parallelism. You may see a curious illustration of this propensity in a seemingly insignificant matter—the timbering of the rural architecture in the north and centre of France. The cottages on which you will note what I am about to point out are, of course, mostly of modern date, but they represent a tradition of which you may trace the source in the oldest part of those towns in which timbered structures of an early period are still preserved. If you look at the timbering of a cottage or house in a purely Teutonic country—in Germany or German Switzerland—you will find that the spaces left between uprights and horizontals are approximately square and crossed with rather frequent diagonal lines; in the French examples, on the contrary, whilst the diagonal lines are very few, the perpendicular line is absolutely dominant; one horizontal line generally sufficing for a whole wall or gable front, and the vertical timbers being brought so close that the space between them is often no wider than the timber itself. To this strong leaning I shall have occasion to draw your attention again further on.

Now it seems to me, I repeat, that the race at whose attributes and physiognomy we have just glanced was peculiarly fitted to conceive and develop the new style of building—a style in which inertness is replaced by active force, a style which, while in its absolute plasticity it offered the widest scope for innovating genius, required nevertheless for its fullest development the logical clearness and grasp of ideas which were conspicuous in the mental equipment of that race, a style in which liberty and restraint, audacity and prudence, science and emotion were so marvellously blended. It was through the balance of these opposite qualities that Gothic building reached its highest level; it was in the disturbance of that balance, in the undue encroachment of mathematics on sound artistic feeling, that the seed of its decline was sown. From the moment that all the forces of which the poise and stability of a structure were the result were gathered up into a system of ribs, shafts, buttresses and pinnacles, forming a complete self-sustaining skeleton, carrying a roof, not of concrete, but having the play and life of masonry, it became evident that structurally the wall had become superfluous; it was a mere screen, and accordingly the Frankish architects proceeded with constantly-increasing boldness to its suppression, gradually restricting the solids almost wholly to constructive functions; manifest construction became thus a leading leature of the style. You see at a glance how, apart from the primary statical motive, the broken arch became in vaulting almost a necessity; the sides of a square being shorter than its diameter, it is evident that a round arch struck diagonally across it must be higher than the arches spanning its sides, and if the field to be vaulted is a parallelogram or irregular in plan, the number of unequal levels at the key of the arches is further multiplied, and those levels can only be brought into even approximate harmony either by stilting the smaller ones, as was done at first, or by breaking the arches, and this latter course soon became universal.

The pointed arch having thus asserted its place in the construction of a building, the desire to suppress all superfluous wall-space, allied to a sense of fitness, prompted its adoption in the case of the windows, which presently reigned over the whole space between pier and pier, and this expansion of the field of light was further demanded for the display of stained-glass, to which growing importance was constantly given as an element of effect in the internal decoration of churches, and with glorious results. No one who has not seen, as one still may see in France, a cathedral of which the glass is preserved

throughout, or nearly so, can form an idea of the effulgent magnificence and poetic charm which attach to this flinging of a heaven of colour about the majesty of the house of prayer. I may note, by the way, that in France this effect is often heightened by the glazing of the triforium, which is opened out by the substitution of a ridge-roof for a lean-to over the aisles.

But whilst the germs of this architectural growth found favouring soil in the intellectual temper of the race that initiated it, the peculiar æsthetic bent to which I have called your attention, the love of slim and aspiring lines, had special scope in a style in which the operative forces might be gathered up in increasingly slender channels, and in which horizontal lines had no necessary place except to satisfy the eye with a sense of binding between the parts; and in truth the horizontal line rapidly dwindled, almost in some cases to effacement. So, for instance, in the cathedral of Clermont-Ferrand—I quote it because it is peculiarly happy in its elegant proportions—the only horizontal in the whole building, if we except the window-sills, is a very narrow string along the base of the triforium, and this does not go round the pier shafts, which spring, absolutely unbroken, from floor to roof. The supremacy of the vertical line is here further emphasised by the carrying of the shafts of the clerestory windows—as is not infrequent in France—down through the triforium, which thus becomes, in a manner, one with the upper lights. The total effect is extremely dignified, and gives that sense of satisfaction which is inseparable from the spectacle of a constantly-developed dominant idea.

(*To be continued.*)

CHEMISTRY OF BUILDING MATERIALS.*

(*Concluded from page* 371.)

IN actual practice the following process is followed more or less. The quicklime is first slaked with water in the proportion of one of lime to three of water; when thoroughly slaked it is intimately mixed with three or four parts of clean sharp sand and sufficient water to uniform thin paste. The sand used should be thoroughly clean and contain sharp particles. That which has been rounded by the action of water, such as sea-sand, is best. The best sand is powdered quartz or flint. Instead of sand, burnt clay or slag or clinker pozzuolana, the vitrified produce of volcanoes, are often employed. In all these cases care must be taken that the substance is clean and contains sharp particles. The setting of mortar is due simply to drying; the hardening is due to the absorption of carbonic acid from the air and the formation of Ca Co_3. Mortars set in a few hours, but require many years of exposure before they attain their maximum of hardness. It has been found that mortar taken from the Pyramids actually contains free lime in the interior where it has not been exposed to the action of the air. The process then is briefly this: when the lime has set, *i.e.* dried, it begins to absorb Co_2, the calcium carbonate so formed cementing the sand and the building materials (brick) together. It is to be noticed in this point that dry lime only has the power of absorbing Co_2, moist lime does not do so. The sand is merely a mechanical ingredient and plays no part in the chemical process of hardening, neither does it, as has been supposed, combine with the lime in any way. Its action is, as has before been stated, to separate the grains of mortar, and to provide a nucleus for the lime to harden upon, and by making the substance of the mortar more porous, to assist the passage of air and consequently Co_2 into the interior. From analyses of old Roman cement found in Kent, England, by Arnold Spiller, it appears that the whole of the lime is in combination with Co_3 as Ca Co_3, except in such cases where the Co_2 has not penetrated into the interior and it is still in the condition of calcium hydrate. There is no evidence of the formation of silicate. The water originally present in these cements, examined by Mr. Spiller, would appear to have been entirely eliminated, and the amorphous carbonate of lime, by the joint action of carbonic acid and water from the air, has been gradually converted into a crystalline form, a process that would undoubtedly tend to harden the mass. Limes are classed according to their purity and their hydraulicity:—Rich or fat limes, which are nearly pure, Ca O. Poor limes, containing more or less silica as sand or quartz, inert, slightly hydraulic, hydraulic, eminently hydraulic, hydraulic mortars. Hydraulic mortars are such as possess the property of hardening under water or in the presence of water. The above subdivisions discriminate limes which possess to a greater or less degree the power of setting under water or in the absence of air. This property is induced by the presence in the limestone of certain constituents, the most important of which is undoubtedly clay. The presence of clay modifies the slaking action in addition to conferring the power of hydraulicity. Clay is a silicate of alumina, and contains silica in what is known as the soluble form of hydrated silicic acid, in contradistinction to sand, quartz and flint, which consist of insoluble anhydrous Si O_2. I can do no more than state this fact here—the study of these varieties of silicic acid is one which is of extreme interest, both theoretically and practically, but unfortunately also one on which I dare not trust myself in the short space allowed me. The important nature of the difference is, however, so great that all analyses of limestones, to be of any value, should clearly discriminate between the quantity of silica in the soluble and in the insoluble form. Soluble silica in the form of clay, slag, scoriæ, pozzuolana, &c., confers hydraulicity. The other variety or sand, quartz, flint, &c., does not. If a fat lime be mixed with clay in proper proportions, the mortar so formed will be hydraulic.

Magnesium carbonate also possesses hydraulic properties, reducing the energy of slaking and increasing the power of setting. When 30 per cent. of Hy Co_3 is present, lime is rendered hydraulic without the presence of clay.

Alkalies and metallic oxides assist hydraulicity if the heat of calcining is not raised too high. In fact the temperature of calcining is a very important factor in determining the hydraulicity of the lime or cement produced. It must not be forgotten that the presence of oxides of the metals lower the point of fusion of a limestone. Pure silica is an infusible substance, but when mixed with metallic oxide fuses very readily, combining with the metal present.

Fat limes are produced by calcining the purest form of calcium carbonate, that formed by calcining white marble being the purest. It is to be noted that the chemical composition and not the physical structure of the stone determines the quality of the lime, chalk and marble producing the same lime. Neither do fat limes produce the best mortar, in fact, a fat lime ought never to be used in exposed work. Poor limes contain from 60 to 90 per cent. Ca Co_3 with inert substances, as sand, which have no chemical action. Such limes may be used and made hydraulic by mixing with clay.

Hydraulic limes contain from 70 to 90 per cent. Ca Co_3 combined with clay or Ca CO_3. The hydraulicity of such limes increases with the increase in the quantity of clay present up to a certain point. It is found that the hydraulicity is greatest when the limestone contains 30 per cent. of clay. When the amount of clay becomes greater than this the mortar becomes less hydraulic.

Before I speak of the chemical action that takes place in the setting and hardening of hydraulic limes which depends on a different reaction to what takes place in the hardening of ordinary mortar, I will say a few words as to cements. Cements are in many respects similar to hydraulic limes. Natural cements are calcined from limestones containing from 20 to 40 per cent. of clay. A typical example of natural cement is that known as Roman cement, which is made by calcining nodules which occur in the London clay. These nodules contain 30 to 45 per cent. of clay, and are calcined at a low temperature. Cement differs chiefly from hydraulic mortars by not slaking with water. It sets to a far denser substance, and shrinks only very slightly on drying. The best known of the artificial cements is the so-called Portland cement, which is made by mixing chalk and clay with water to a creamy consistency, which is allowed to dry, then calcined at a temperature short of vitrification and ground to fine powder. The clay and chalk are mixed in such proportions that the resulting cement shall contain 20 to 25 per cent. clay. You have noticed that Roman cement is calcined at a low temperature and Portland cement at a higher one. The temperature at which a cement is calcined depends upon the proportion of silica to the other ingredients. A large proportion of alumina and iron in proportion to the silica causes the fusion of the mass at a comparatively low temperature. Portland cement, which contains a large excess of silica, can be calcined at a high temperature without vitrification. The following are the principal reactions that take place when cement is calcined at different temperatures:—

At a low temperature the carbonic acid is driven off, and the silica combines with the lime, but not with the alumina, hence if the stone is rich in clay the whole of the lime is converted into carbonate silicate. If there is little clay present the whole of the lime present is not converted into silicate, and the result is that the product of calcination contains quicklime. This explains the difference in slaking off ordinary mortars, and hydraulic mortars and cements. Ordinary mortars containing no clay, the product is more or less pure quicklime, which slakes, as you have seen, with great energy. Hydraulic mortars contain up to 30 per cent. clay, which produces sufficient silica to convert the greater portion of the lime into silicate on calcining. A portion of unchanged quicklime is, however, left, hence such limes have a feeble slaking action. Roman cement, which we take as an example of a cement burnt at a low temperature, contains 30 to 45 per cent. of clay, which you remember is a silicate of alumina. The whole of the lime is converted into silicate, and the product contains no free lime. When the

* A paper by Mr. F. B. Guthrie, F.C.S., Demonstrator of Chemistry at the Sydney University, read at a meeting of the Sydney Architectural Association.

stone is calcined at a high temperature, a further action takes place between the lime and the alumina, which combine to form aluminate of lime, in addition to the silicate of lime. Further reaction takes place, which results in the formation of a double silicate and aluminate of lime. That is a substance in which lime is combined with both silica and alumina. Now, both these substances, aluminate of lime and the double silicate, possess the property of becoming hard when mixed with water, and independent of the action of the air. The result is, therefore, a cement of great strength. This further explains why Portland cement should be burnt at as high a temperature as possible. Portland cement contains only from 20 to 25 per cent. clay. If this were only moderately calcined the result would be a hydraulic lime, which would slake slightly, and the hardening would not take place simultaneously, the result being a tendency to blow. The higher temperature is used to insure the formation of aluminate of lime and the double silicate and aluminate. The setting and hardening of cements is due to other causes than in the case of mortars which harden by absorbing Co_2. The water acts by allowing the silicate and aluminate of lime to combine with each other to form hydrated silicates, which set by crystallising. There is another class of cements which set by reason of absorption of water, namely, those of which $Ca\,So_4$ is the basis. $Ca\,So_4$ occurs in the tertiary deposits in nature in two or three modifications, as selenite $+ 2H_2O$ in transparent prisms, as gypsum $2H_2O$, and alabaster in opaque or semi-opaque masses. In these forms it is combined with two molecules water, third as anhydrite, which is anhydrous $Ca\,So_4$.

When gypsum is heated at a moderate temperature as high as 120°, it parts with its water, and is known as plaster of Paris. This substance readily re-absorbs the quantity of water which has been driven off, and becomes hard and sets in the process. It also expands slightly in setting, which makes it exceedingly valuable for taking casts of coins, medals, &c. When the gypsum is heated to 200° it becomes hard-burnt, that is, it absorbs water very slowly and does not harden. If it be heated to a still higher temperature to 500° it absorbs water very slowly, the absorption not being complete at the end of several weeks, but it then sets to a very hard alabaster-like mass.

Sulphate of lime is soluble to some extent in water, hence such plasters do not bear exposure to the weather, but are used largely in internal work as coatings to walls and ceilings, their quick-setting and drying properties making them very valuable materials. When plaster of Paris is mixed with certain salts, as alum and borax, they set into a harder cement. Examples of such cements are Keene's cement containing alum ; Parian cement containing borax ; Martin's containing potash carbonate.

With regard to the testing of cements, you will learn more from a visit to cement works, where these tests are constantly employed, than from anything I can tell you. The weight is of importance. This varies from 95 to 130 lbs. per striked bushel, and should be so finely ground that 80 per cent. of it passes through a sieve containing 2,500 meshes to the square inch. A heavy cement sets more slowly, but becomes harder, and is more likely to be thoroughly burnt throughout. The tensile strength is of the greatest practical importance, and is ascertained by moistening the cement with water, and introducing it without pressure into a mould shaped like an hour-glass, and allowing it to dry. The briquettes thus formed are allowed to remain for varying periods in water and in air, and are then placed in a proper testing machine, and the weight noticed at which they break. The briquettes are formed so that the waist—the point where they break is 1½ by 1½—is 2½ square inches. The strength required varies, of course, under different contracts, and according to the work required. The Metropolitan Drainage Works required that the briquettes, after being immersed in water seven days, should bear a weight of 350 lbs. per square inch, *i.e.* 787 lbs. in the briquette area. It is usual to test them after seven days' immersion ; a longer immersion, however, would give a far higher breaking power, and such cement as the above would bear 450 lbs. to the square inch after thirty days' immersion. The chemical analysis of a cement is rather tedious, but does not present any particular difficulties. It is important in such analysis that the distinction should be clearly marked between silica in the form of sand, flint, &c., in which condition it is inert and in the form of clay, to which the mixture owes chiefly its hydraulicity.

Iron.—This most important metal is very rarely found native. Its most important ores are oxide or carbonate. As oxide it occurs as magnatite or magnetic iron ore $Fe_3\,O_4$, as specular iron ore or hæmatite $Fe_2\,O_3$, and brown hæmatite $(Fe_2\,O_3)\,(H_2\,O)_3$. As carbonate it occurs as spathic iron ore, which is nearly pure ferrous carbonate. Clay-ironstone is ferrous carbonate, mixed with clay and other mineral substances. Black-band is ferrous carbonate, containing bituminous matter. The ores are usually roasted, to remove volatile impurities, before being introduced into the furnace. In the blast furnace, which is a gigantic structure 50 to 80 feet high, the ore is introduced in alternate layers with coal or coke mixed with limestone. Hot air is forced in at the bottom, to assist the combustion of the coals ; carbonic acid and steam pass up along with the hot air, and, coming in contact with the white hot carbon of the coal, are reduced to CO and H. When the ore introduced at the top has descended sufficiently to be heated by the mixture of N CO and H, it becomes converted into spongy iron. The spongy iron descends, mixed with the clay and limestone, to the hotter parts of the furnace, where the iron combines with C to form a carbide of iron, while the lime unites with the silica and alumina to form a slag. The iron sinks through the slag, or is run off by means of a clay plug. In addition to the carbon, the iron in the molten state takes up silicon, phosphorus, sulphur. This mixture of iron with C Si PS is known as pig-iron—an impure form of cast-iron. Liquid iron takes up about 5 per cent. C., forming a compound of the composition F_4C. When the iron is rapidly cooled a white crystalline mass is obtained, known as white iron. When cooled slowly some of the carbon crystallises out in scales, and the iron has a grey or mottled fracture from particles of C. When white cast-iron is dissolved in HCl no C is left. When grey cast-iron is dissolved C is left behind, the explanation being that the C in grey iron is not combined with Fe, and is not attacked by H, whereas the C in white iron is chemically combined with F and is attacked by the H forming hydro-carbon. White iron fuses more readily than grey. The specific gravity of cast-iron varies from 7 to 7·25, sometimes higher. The lighter varieties are inferior, both as regards tenacity and stiffness, to the denser, hence the readiest way of judging the strength of cast-iron is to take its specific gravity. Large and massive castings are not so strong as smaller castings of the same materials, the reason being that in the gradual cooling the mass forms into large crystals. This is obviated to some extent by using an iron mould, which chills the surface and makes it cool rapidly.

Malleable and wrought-iron is made from pig in the following manner :—The pig is melted in a shallow hearth in a reverberatory furnace ; air is forced into the molten mass by twyers. The effect of the passage of air is to oxidise the Fe, forming a skin of ferric oxide. This is called fine iron. It is then puddled. This is stirred about ; the C is thus burnt out partly by the oxygen of the air and partly by the ferric oxide, the liquid mass gradually becomes pasty, and is ultimately removed in balls or "bloom" by means of the stirrer. This process is known as puddling. The balls are then hammered under a steam-hammer to squeeze out the slag and impurities. It is further refined ; the main difference between cast and wrought-iron consists in the quantity of carbon. Bessemer's process of decarbonising cast Fe is to blow air rapidly through melted cast-iron contained in a clay pot. Great heat is evolved, and the N and Co evolved keep the mass in constant agitation.

Steel is manufactured by the Bessemer process by burning out all the C and Si in cast-iron as in the manufacture of wrought-iron, and the adding of sufficient spiegeleisen, a variety of cast-iron very rich in C and containing 5 per cent. manganese. Cast-iron contains about 5 per cent. C. Wrought-iron contains 0·15 to 0·5. Steel contains from 1 to 2 to 3 per cent. Steel is also manufactured by the cementation process, by which plates of soft iron are arranged in a stoneware box, with alternate layers of charcoal, the whole closed and heated for several days at a bright red heat. By this means carbon is converted into CO, which penetrates the iron giving up C and becoming CO_2. This CO_2 is again reduced by the charcoal, and forms CO. The steel thus obtained is called "blister steel," and contains about 1·5 per cent. of C. It is covered with blisters from the escape of gas, and is not of uniform texture. It is then fused in crucibles of clay and plumbago and cast into moulds. This is known as cast-steel. Shear-steel is blister-steel treated as in the manufacture of wrought-iron. Steel is especially valuable for its elastic properties. It can be hardened by the process of tempering, *i.e.* by suddenly cooling down from a high temperature, and again softened by re-heating and cooling slowly. Case-hardening is a rapid process of cementation. The rim is heated and sprinkled with carbonaceous matter containing N, as horns, leather or bone. The iron is heated to redness, and the powdered substance sprinkled over it. When thoroughly cooled the surface is found to be hard enough to resist the file. The reaction is the same as in the cementation process. Both wrought-iron and steel may be made directly from the ore by the Catalan forge, in which ore is reduced by C, slag run off, rolled and hammered.

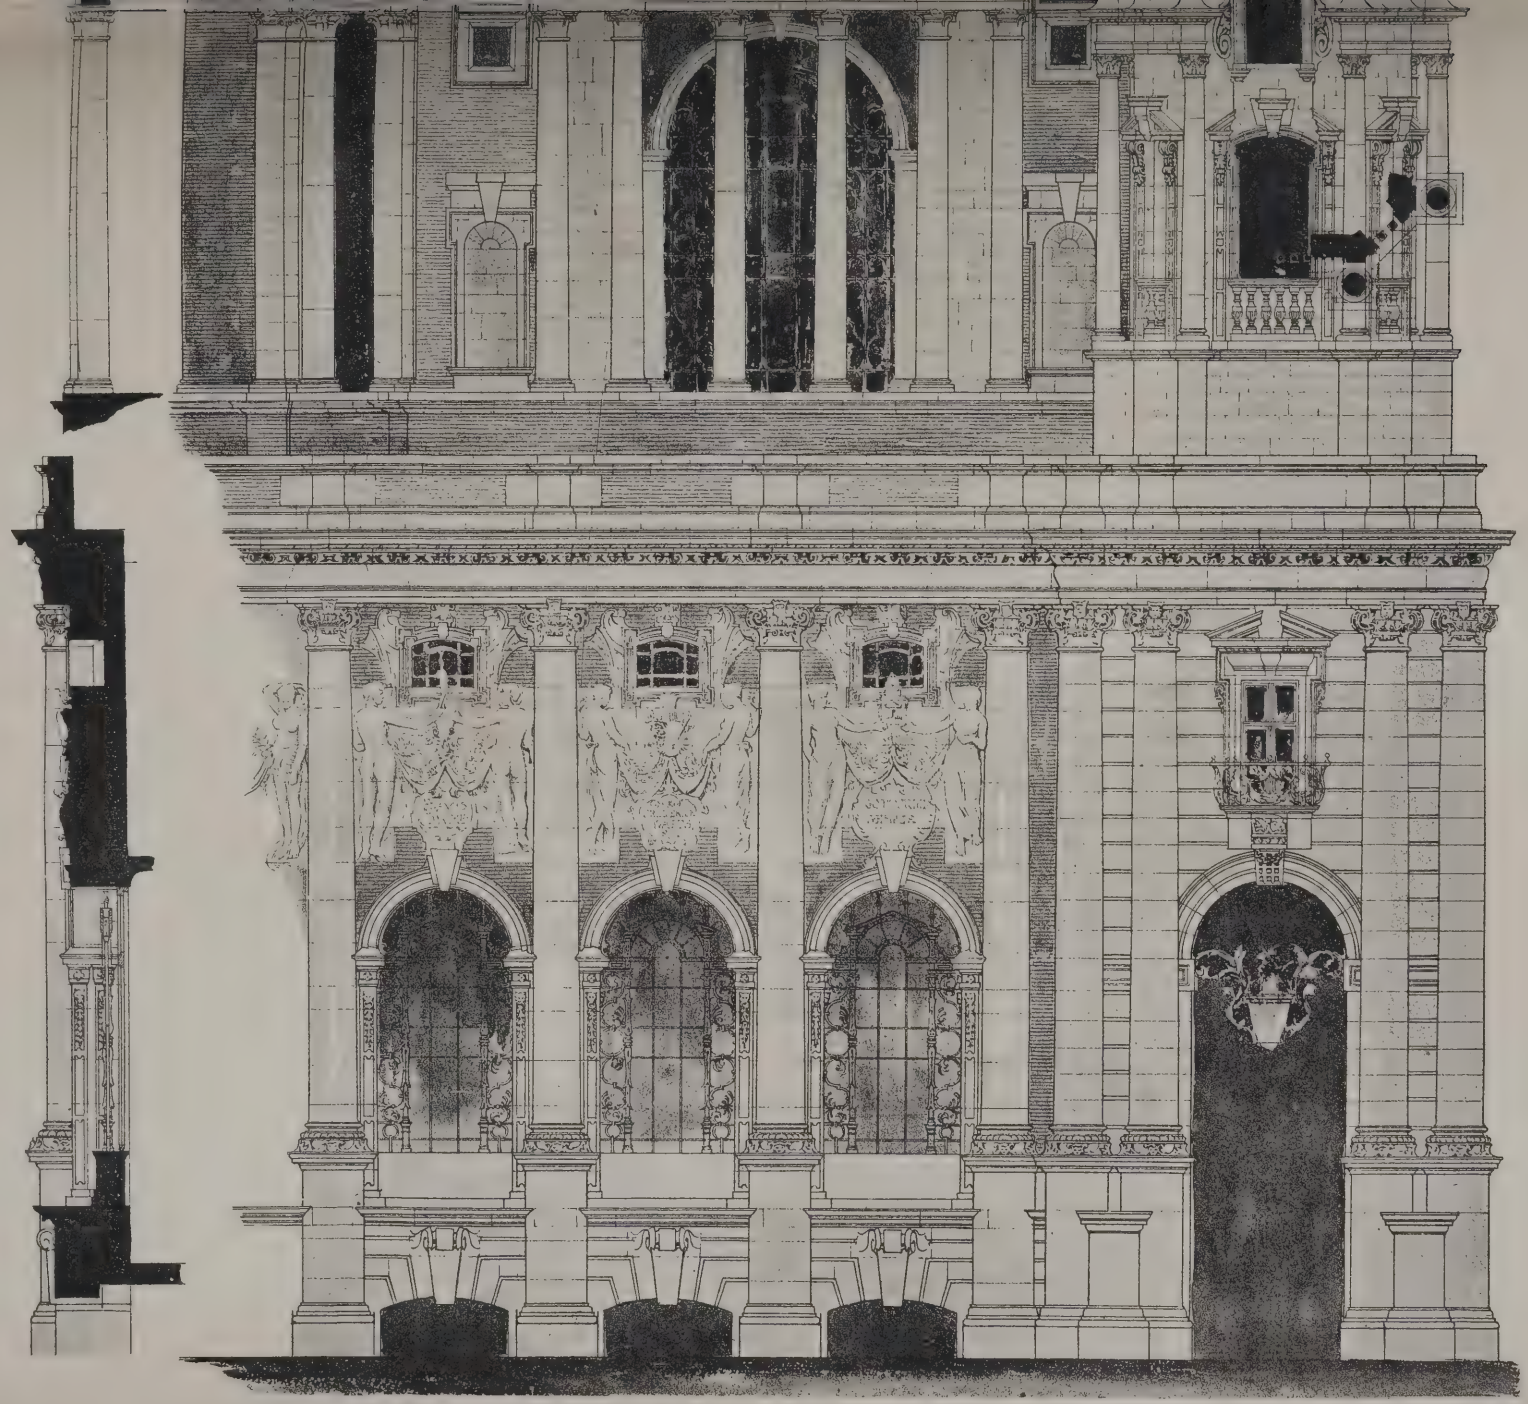
The rusting of iron is brought about by exposure to the combined action of air, H_2O and CO_2, the ferrous carbonate formed being converted into ferric oxide, and subsequently into ferric hydrate. Iron may be protected by painting or by coating with magnetic oxide. This process, known as Barff's, and improved by Bower, consists of passing superheated steam over red-hot iron. The iron combines with the oxygen of the steam and coats itself with a black magnetic oxide of iron which resists further action and will not rust. The disadvantages are that large castings cannot be conveniently raised to a high temperature. The method is very good for small castings, especially those of an intricate nature.

NOTES AND COMMENTS.

IT has been arranged that the sketch models for the memorial of the Emperor FREDERICK, which is to be erected on the battle-field of WÖRTH, are to be sent to the Academy of Arts in Berlin not later than April 1, 1892. They are to be distinguished by mottoes. The memorial is to stand upon the hilly ground on the spot where the Crown Prince watched the operations of the armies. There is to be an equestrian figure of the Prince, who is to be represented in the uniform he wore on the day of the battle. The pedestal will bear reliefs which are to indicate the union of troops from various divisions of the empire in the struggle to win back Alsace for Germany. The principal figure and reliefs are to be in bronze. The sum assigned for the sculpture and pedestal is 200,000 marks. The models are to be exhibited in Strasbourg as well as in Berlin, and in the final arrangements the Statthalter of Alsace will have a voice with the Emperor. The jury will consist of Dr. SCHÖNE, director of the Berlin Galleries; Professor VON WERNER, of Berlin; Dr. ROHDEN, of Hagenau; Professors ENCKE and BEGAS, of Berlin; Professor RÜMANN, of Munich; and Professor DIEZ, of Dresden. The authors of the three models which are placed next in merit to the approved design will each receive 4,000 marks. Evidently it is the desire to give an Imperial character to the memorial, and therefore all German sculptors are eligible to compete.

THE Oswestry Municipal Buildings will be carried out under the direction of Mr. T. M. LOCKWOOD, of Chester, who has acted as adviser of the Council in the arrangements of the competition. In a letter on the subject, Mr. LOCKWOOD says:—"I think it is best to name a sum for architect's fees, and not in the present instance to work on commission. I am willing to undertake the drawings, specification, details and superintendence for the sum of three hundred guineas, travelling expenses to be the amount only paid out of pocket. As I explained, the whole of the plans, elevations, sections and details will have to be redrawn, as practically all I have is the arrangement of plan only, and I would suggest certain slight modifications of the character pointed out to you, a sketch of which I will bring over in a few days." Mr. LOCKWOOD'S offer has been accepted by the Town Council.

AN American artist, Mr. F. B. CARPENTER, has painted a large picture of the meeting of the representatives of Great Britain and America in order to settle amicably the dispute over the *Alabama* affair. The Americans who appear are Mr. HAMILTON FISH, Judge NELSON, General SCHENCK, Judge HOAR, Mr. WILLIAMS and Mr. BANCROFT DAVIS. The English representatives are the Marquis of RIPON, Sir STAFFORD NORTHCOTE, Sir EDWARD THORNTON, Sir JOHN MACDONALD, Professor MONTAGUE BERNARD and Lord TENTERDEN. The painting has been purchased by Mrs. W. W. CARSON, of Dalton, Mass., for presentation to the Queen, who has agreed to accept the work.



THE fifth general meeting of the Royal Society of Antiquaries of Ireland was held in Dublin on the 10th inst., when the great and most successful labours of Mr. ROBERT COCHRANE, the honorary secretary, found due recognition. It is not easy for a stranger to realise the difficulties which are before anyone who endeavours to unite Irishmen, who by destiny are made to be at variance with one another, in admitting that any work deserves their co-operation. But this feat has been accomplished by Mr. COCHRANE, with a result that might be called miraculous. Archæology was becoming a sort of isolated study in Ireland that was to be pursued in secret, and in consequence there was a risk of fads being taken as infallible principles. The new Society has brought about a change, and not only are students of archæology willing to submit their conclusions to discussion, but men of all creeds and parties are not afraid to meet in public and explore uninhabited districts together. It is gratifying to know that so salutary a revolution is brought about by the zealous exertions and disinterestedness of an architect, and our readers will be glad to learn that Irishmen can appreciate the devotion of Mr. COCHRANE to a good cause. At the meeting that appreciation assumed a triple character, as if suggested by the national symbol. The president, Lord JAMES WANDESFORD BUTLER, D.L., and members of Council, presented Mr. COCHRANE with a handsome and costly writing cabinet, in acknowledgment of his services as editor of the *Journal*; the members of the Society joined in offering an illuminated address, bound in album form in the most artistic fashion. The third gift was from the older members of the Society, who were the best judges of Mr. COCHRANE'S services, and consisted of a service of silver plate, which was made from special designs for the occasion. It must be satisfactory to Mr. COCHRANE to find that his skilful guidance of the Society through many difficulties is remembered, and the presentation can be considered as no ordinary ceremony in a country like Ireland, where gratitude is rendered only for political services.

PERIODICALLY since 1863 international exhibitions promoted solely by artists have been held in Munich. Next year the sixth of the series is to be held. The preliminary arrangements have been completed so far as the election of committees. The majority of the members are painters, for they have the public on their side in all questions relating to exhibitions, but there are also some architects and sculptors. The president of the central committee is Herr EUGEN VON STIELER, and Herr ALBERT BAUR is secretary. Professor ALBERT SCHMID is president of the building commission. The preceding exhibitions were opened on July 1, but next year the opening day will be a month earlier. The closing will be on October 31. Communications about works for exhibition must be sent before March 15, and works will not be received after April 15. The Prince Regent has promised the patronage of the actual head of the State, and Prince LUDWIG will act as honorary president. The Governments of Belgium and Holland have already signified their co-operation, and have appointed representatives.

FOUR examples of Florentine sculpture in stucco, in which the various parts are coloured, have been acquired for the Louvre. Polychrome sculpture is generally considered to be made up of materials of different colours, and the *Minerva* of PHIDIAS was probably an early example. FALCONET, the French sculptor, when writing on the subject, says that if employed with intelligence, materials of a variety of colours can be combined in such a way as to produce some picturesque effects, but generally the result is disagreeable. While admitting that sculpture is best when all parts are of one colour, the love of liberty among the Italians of the Renaissance, and the desire to puzzle posterity, did occasionally tempt them to continue the Gothic traditions, and paint both figures and draperies. Polychromy was admired by VEROCCHIO, CARADASSO, RICCIO, BENEDETTO DA MAJANO, and it is supposed that JACOPO SANSOVINO also painted his statues. Works in terra-cotta and in wood were often coloured, although from a great many examples the colours were subsequently removed to satisfy the change in taste. Painters also worked on the sculpture of their friends. LORENZO DI CREDI and COSIMO ROSSELLI helped in that way. The process of painting continued until the sixteenth century, for records remain of commissions for figures in terra-cotta for Italian churches, which were specified to be coloured with oil paints and gold laid on in some parts. The practice must have prevailed in SHAKESPEARE'S time, for the figure of HERMIONE ("by that rare Italian master GIULIO ROMANO"), in the "Winter's Tale," was not intended to counterfeit a white marble statue, although of late years actresses and stage-managers will endeavour to deceive LEONTES and the spectators by an approximation of a plaster cast that coldly stands on a pedestal. For the veins are supposed to look as if blood coursed through them, the lip was warm with life, and the King was not allowed to kiss the face, because, as he was told, "You'll mar it if you kiss it; stain your own with oily painting." Unfortunately in England there is no place to display Renaissance sculpture, and as the polychrome variety is only to be known through books the mode of treatment is considered to be a relic of barbarism.

ILLUSTRATIONS.

ARCHITECTURAL ILLUSTRATION SOCIETY. SECOND SERIES.

NO. 445.—DESIGN FOR COMPLETION OF SOUTH KENSINGTON MUSEUM:—DETAIL. [JOHN BELCHER.]

NEW LIBERAL CLUB, HAMPSTEAD.

IN this building the accommodation provided for the members comprises the ordinary requirements of a club-house, and includes billiard and bagatelle, card, smoking and reading-rooms; and, in addition, there is on the ground-floor a large public room, available for political meetings, concerts, &c., and capable of seating from 150 to 200 persons. The building was erected by public subscription, at a cost of about 2,600*l.*, and much credit is due both to the building committee and to the indefatigable treasurer, Mr. B. A. LYON, for bringing the undertaking to a successful issue. The fronts are faced with red bricks and Ancaster stone, and the roofs are covered with green slates. Messrs. ALLISON & FOSKETT, of Hampstead, were the builders, and the architects, whose design was selected in competition, were Messrs. SPALDING & CROSS, of 15 Queen Street, E.C. The club-house was opened on June 14, 1890, by the Marquis of RIPON, K.G. Our illustration is taken from the architects' drawing exhibited in this year's Royal Academy exhibition.

PALAIS DE JUSTICE, ROUEN.

THE Salle des Procureurs of the Palais de Justice at Rouen dates from 1393, but the other parts were erected by LOUIS XII. in 1499, some say in 1504, as a Court of Exchequer—an institution that led to the Normandy Parliaments, in which popular rights were protected. The building generally known as the Palais forms one side of a square, and adjoins the Salle. The hall, or Grand Chambre, is one of the finest in France. FRANCIS I. in 1517 dwelt in the Palais, and it was in the register described as "sompteux et de grand coût." In the course of the centuries the building underwent changes, and in 1812 a part fell down. Credit must be given to M. GRÉGOIRE for the care with which he restored the Palais. The lower windows of the central tower, shown in the illustration, he found with square heads, and, in fact, there was a medley of incongruous and beautiful detail. The illustration is a reproduction of a drawing by Mr. A. MCGIBBON, of Glasgow, that was exhibited this year in the Royal Academy.

BANKING PREMISES FOR A COUNTY TOWN.

THIS illustration is taken from a drawing by Mr. ALBERT BREDEN, which was exhibited in the last exhibition of the Royal Academy.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting of the Institute of Architects was held on Monday evening, Mr. J. MacVicar Anderson, president, in the chair.

The PRESIDENT announced that under by-law 20 the following had ceased to be members:—Messrs. A. Young, C. L. Cadney, J. Mossop and C. E. Powell.

Examinations.

The PRESIDENT stated that in preliminary examinations held last month in London and Manchester sixty candidates passed, inclusive of twenty-one who were exempted; these were now qualified as probationers. Nine were relegated for further study. For the intermediate examinations in London and Manchester twenty-three passed and four were relegated. In the examination for architecture qualifying for Associateship twenty-six passed out of forty and fourteen were relegated. Of the twenty-six Mr. John Begg was pronounced as having most highly distinguished himself, and was deserving of the Ashpitel medal. Mr. Owen Fleming, London, came next, followed by Mr. John William Twist, of South Shields.

A paper was then read by Mr. Horace Townsend, of New York, of which the following is an abstract, on

American Theatres.

Mr. TOWNSEND, in his introductory remarks, said that having been, during twelve years' residence in the United States, four years a practising architect and the remainder a dramatic critic and writer, he had had exceptional advantages for studying the American theatre. He expressed, though, the diffidence with which he ventured to read a paper on the subject before architects who had more knowledge of theatre building than he pretended to have, and many of whom had erected them. The theatre, he said, was, as now understood, a comparatively modern institution, and less hampered by precedent or tradition than most public buildings; but certain influences caused all theatres to present a family likeness, though the features offered points of difference. It was a curious fact that the American theatre-type followed the French in having no pit, although the theatre in America had, from a historic point of view as well as an architectural one, generally followed England rather than France.

It was not until the middle of the last century that a permanent theatre was established even in New York, and, as far as could be judged, it was not unlike one of the smaller London playhouses of the same epoch. A generation or so ago, however, the Americans had become a theatre-going people, and theatres of pretensions such as the Old Bowery, the Academy of Music, and Walleck's were built, following the English model with one important exception—the pit. It was, he thought, the inherent democracy of the people which led to the planning of the theatre with its "pit" (a term unknown in America) on the ground-floor level, and to the abolition of all boxes save the four on each side of the proscenium. In every case the theatre, even at that date, was conceived on a simple and sensible plan, viz. an oblong block divided in three parts transversely, of which the largest was in the middle occupied by the auditorium; the second in size at one end devoted to the stage, while the third was again divided into three parts by lines parallel to the greatest length of the oblong, the central spaces being devoted to the main entrance, which thus led directly from the street to the auditorium, and in the space on either side were the means for ascending to the higher portions of the house. The very latest American theatres were planned more or less on the same broad lines, but for some score or so of years the theatres erected afforded very few points of difference, many being built from one set of plans. During the seventies, however, a great influx of theatre-building took place, but it was not until the close of that decade that a small theatre erected in New York introduced a new era of American theatre architecture. The Madison Square Theatre, presenting many original points, was the outcome of the talents of more than one man. Two brothers named Mallory provided the funds; an actor and manager, one Steele Mackaye, a portion of the ideas; and two clever young architects, Francis H. Kimball and Thomas Wisedell (an Englishman), the professional skill which put the theories into practice and materially improved upon them. Though the old form of horseshoe balcony or gallery, with the floor sloping upwards on one plane, offered excellent opportunities of hearing, people seated at the sides had a limited view. These architects obviated this difficulty, and gained a fairly large seating accommodation in an auditorium of limited capacity by sloping the main floor uniformly upwards from the stage, which was raised but slightly above the level of the auditorium, and each row of seats on the main floor was raised about 4½ inches above the one immediately in front. The balcony above this main floor was very deep, approaching in its centre much closer to the proscenium line than usual, but instead of the horseshoe curve the front was twice broken abruptly in its outline, being in the centre a little flatter than semicircular, with the sides of an ogee form. Other details of the Madison Square Theatre were then given by Mr. Townsend, notably the arrangement of a double stage, the ventilation and warming of the auditorium, the picture-framed proscenium and the overhead orchestra. Although the theatre was very successful, the practical good sense characteristic of the American people prevented a slavish imitation of it. Certain points not being found wholly successful were discarded, but the heating and cooling apparatus and the seat arrangements were in the main followed by subsequent designers.

The author then proceeded to point out the salient points of difference between the ordinary theatre in New York and London, taking as an example of the former the Madison Square Garden Theatre (not the building above referred to), and of the latter, Terry's Theatre. The Madison Square Garden Theatre was chosen by him as one of the first built under the new building laws, Terry's being also selected as of recent date. A noticeable difference was the greater space devoted to the stage and auditorium in the American theatre, though land was as a rule dearer in New York than London, and rentals higher, while the population was less than half of that in London. Then the great simplicity of arrangement—the main floor devoted to seats of one character, and entered almost directly from the street; the balcony seated in the same homogeneous way, and reached by a broad and direct staircase; and the readier accessibility of the dressing-rooms, some of which open practically on to the stage, and none of them being below the level of the street: a point to be by no

means overlooked. As regards the warming and ventilation, the author was almost inclined to sum up the difference between the two countries by saying the Americans heated and ventilated their theatres as well as cooled them in the summer, while the English did not; but he thought that might be beyond fair criticism. Certain it was that in all the later theatres in America ventilation was as nearly perfect as might be.

Mr. Townsend dealt next with several other theatres in New York, giving a description of each, among them the following:—The New York Casino, by Messrs. Kimball & Wisedell, one of the most beautiful theatres he knew of; Palmer's Theatre, the Metropolitan Opera House, the Broadway Theatre, the Lyceum, the new Fifth Avenue, Mr. Hammerstein's Opera House, and Harrigan's Theatre. Though he had intended to be silent on the subject of decoration, he could not refrain from adding that London had no theatres that could be compared with the Metropolitan Opera House, the Lyceum, the Madison Square, or the Madison Square Garden in that respect; each was distinctly individual and original, and distinctly pleasing in effect. Of other theatrical centres in America, Philadelphia possessed few theatres calling for remark. Chicago, now that McVickar's was burned down, principally the Auditorium, which was a truly American building, called a theatre, and on occasions serving the purpose of one; in point of fact, it was an enormous hall, designed chiefly for great musical festivals and political conventions. The stage was most marvellous. It was worked by hydraulic pressure, and was divided into sections of a few square feet in area, each of which could be raised or lowered independently of its neighbours by touching a button. No borders were used, but sky effects produced by a species of domed panorama. In Boston the author referred to the Boston Museum, the Boston Theatre, the "Tremont," and the Grand Opera House, which was illustrated by working drawings, lent by Mr. N. B. Goodnow, the owner, and described in detail. Mr. Townsend held it was characteristic of the American client to consider that the best was the cheapest in the long run, and to this was greatly due the growth of a healthy and advanced architectural school in the United States; and perhaps also it was on this account that the New York Building Law was adopted without question or murmuring. The Law was founded upon that of Vienna, and some sections referring to theatres were given by the author in considerable detail.

Mr. C. J. PHIPPS, F.S.A., in proposing a vote of thanks to Mr. Townsend, said there was much in the paper he did not agree with. The difference of planning theatre areas in America and England seemed to be chiefly one of name, the "parquet" corresponding to the English pit and stalls, except admission to the whole area was at one price, an arrangement which would not be popular here. The planning of the general area on the street level, spoken of as an improvement, was not unknown here, but most theatres being three tiers in height, by making the lowest level lower than the street, the number of stairs to the gallery was reduced. The idea of enclosing the stage in a frame was not a novel one, as he had introduced that feature in his reconstruction of the Haymarket at Mr. Bancroft's request, but he did not like the effect, and had since removed it. There was much in what Mr. Townsend had said about the ventilation of London theatres, but the managers could not afford the expense of more perfect arrangements.

Mr. T. BLASHILL seconded the vote of thanks, which was supported by Professor KERR, and on being put to the meeting was carried by acclamation.

Mr. TOWNSEND, in the course of his reply, stated the great difference between English and American theatres was that in the latter the greater portion of the house was seated at one price at about the street level, dispensing with the use of narrow and winding staircases.

MANCHESTER ARCHITECTURAL ASSOCIATION.

OWING to the fusion of this Association with the Manchester Society of Architects, the members met together at dinner for the last time at the Grosvenor Hotel, Manchester, on Tuesday. The toast of "The Royal Institute of British Architects" was proposed by Mr. J. S. Hodgson, and responded to on behalf of the Institute by Mr. Lawrence Booth, F.R.I.B.A. Testimonials were then presented by the Chairman (on behalf of the members of the Association) to Mr. A. H. Davies-Colley, A.R.I.B.A., and Mr. J. D. Mould, A.R.I.B.A. Mr. Davies-Colley has been treasurer of the Association ever since its formation (a period extending over sixteen years), and Mr. Mould has acted as hon. secretary for the past six years. The healths of both gentlemen were given with musical honours, and they responded. The toast of "The Past Officers of the Association" was proposed by Mr. T. Cook, and responded to by Mr. Frank W. Mee. "The Success of the Newly-constructed Manchester Society of Architects" was proposed by Mr. A. H. Davies-Colley, and responded to by Mr. P. E. Barker, A.R.I.B.A. The toast of "The Chairman" was then given and responded to, and the proceedings terminated.

THE ROYAL ACADEMY PRIZES.

THE prizes in the schools of the Royal Academy during the year have been awarded as follows:—Historical painting—*Victory*, gold medal and travelling studentship (200*l.*), Ralph Peacock. Landscape painting—*And now the sun had stretch'd out all the hills, and now was dropp'd into the western bay* (Milton's "Lycidus"), Turner gold medal and scholarship (50*l.*), Francis Joseph Mackenzie. Landscape painting—*An English Lane*, Creswick prize (30*l.*), Emily Louisa Long. Painting of a figure from the life (open to male students only)—silver medal, 1st, George Spencer Watson; 2nd, Reginald Arthur. Painting of a head from the life—silver medal, 1st, Henry Lawrence Dell; 2nd, Gerald Edward Moira. Painting of a draped figure (open to female students only)—silver medal, 1st, Helena Maria Swaffield. Cartoon of a draped figure—*Mark Anthony showing Cæsar's Mantle to the People* ("Julius Cæsar," act. iii. sc. 2), silver medal and prize (25*l.*), Herbert Arthur Horwitz. Design in monochrome for a figure picture—Saul hurling the Javelin (Sam. xix. 8, 9, 10), Armitage prizes, 1st (30*l.*) and bronze medal, Paul Raphael Montford; 2nd (10*l.*), Marion Clarkson. Design for the decoration of a portion of a public building—St. Augustine preaching Christianity in England, prize (40*l.*), Paul Raphael Montford. Set of six drawings of a figure from the life (open to male students only)—1st prize (50*l.*) and silver medal, George Spencer Watson; 2nd (25*l.*), Francis Joseph Mackenzie (disqualified owing to having received the same prize before); 3rd (15*l.*), Lawrence Edward Koe; 4th (10*l.*), Gerald Edward Moira. Drawing of a head from the life—silver medal, 1st, Lewis Christopher E. Baumer; 2nd, Katharine Mary Willis. Drawing of a statue or group—silver medal, 1st, Katharine Mary Willis; 2nd, Evelyn Caroline E. Pyke-Nott. Composition in sculpture—Jacob wrestling with the Angel (Gen. xxxii. 24, 25), gold medal and travelling studentship (200*l.*), Paul Raphael Montford. Set of three models of a figure from the life—1st prize (50*l.*) and silver medal, Andrea C. Lucchesi; 2nd (20*l.*), Paul Raphael Montford. Model of a design—"Joy," 1st prize (30*l.*), Andrea C. Lucchesi; 2nd prize (10*l.*), Paul Raphael Montford. Model of a bust from the life (open to female students only)—silver medal, 1st, Jane Adye Ram; 2nd, Edith Bateson. Model of a statue or group—silver medal, 1st, Edith Bateson. Design in architecture—design for a large town house, planned with a view to the proper placing and lighting of pictures, sculpture and other works of art, but not to contain a picture gallery—gold medal and travelling studentship (200*l.*), Alfred Henry Hart. Set of architectural drawings—Hanover Chapel, Regent Street, silver medal, 1st, Francis Edward Ward. Set of architectural designs (upper school)—prize (25*l.*), Alfred James Edwards. Set of drawings of an architectural design (lower school)—prize (10*l.*), Henry Ernest Kirby. Plan of a building, a public library—prize (10*l.*), Henry Ernest Kirby. The Landseer scholarships in painting and sculpture of 40*l.* a year each, tenable for two years, given for the best work done in the examination for passing into the second term of studentship, have been awarded—in painting, to Gerald Edward Moira; in sculpture, to Paul Raphael Montford.

DISCOVERIES IN CHESTER.

A MEETING of the Lancashire and Cheshire Antiquarian Society was held in the Mayor's Parlour at the Manchester Town Hall on the 11th inst., when a paper was read by Mr. E. F. Benson, of King's College, on the Roman remains discovered at Chester during the recent excavations. He said the excavations had been going on since September under the charge of the City Surveyor of Chester. The results so far had been very good. A piece of the east wall had been opened and a number of interesting tombstones had been brought to light. The Roman military tombstones hitherto found in Chester were tombstones of men belonging to the Twentieth Legion. But the tombstones recently discovered belonged to the Second Legion (*adiutrix*). They were more weather-worn than the tombstones of the Twentieth Legion, and on that account and for other reasons they were supposed to be of earlier date. In all there were ten of these tombstones. The legion in question was in Britain for less than thirty years during the latter half of the first century, and his theory was that it took the place of the Twentieth Legion at Chester while that legion was absent in Scotland with Agricola. Photographs of a number of the tombstones were shown on a screen. The tablet on which the inscription was placed is round at the top, and not square, as is the case of the tomb-

stones of the Twentieth Legion, and the inference was that round tops were the fashion at the time the Second Legion was at Chester, and that the square top came in later. The inscriptions gave various particulars with regard to the deceased, such as their names, ages, the years they had served, their place of birth, and usually a word or two in praise of their career. Mr. Benson afterwards discussed at length the rival theories as to the origin of the wall—the one that the stones are Roman but that the wall was not built by Roman hands, and the other that the wall was Roman *in situ*. The latter was the view he supported. In concluding, he said there was plenty of work still to be done, and expressed the hope that it would not be stopped for want of the money necessary to carry it on. A vote of thanks was passed to Mr. Benson for his paper.

Professor Boyd Dawkins said there was the clearest proof that the original buildings of Manchester were the work of the Roman Legion whose headquarters were at Chester, so that the history of Chester was to a large extent connected with that of Manchester. He was sure that considerable light would be thrown upon the Lancashire Roman period by the inquiries which were being carried on at Chester, and which he hoped would be continued.

MUNICIPAL BUILDINGS, BATH.

A SPECIAL meeting of the Town Council was held on Friday last to consider the question of providing a new municipal building for Bath, the present structure having become altogether inadequate to meet the existing needs. A report was presented recommending the adoption of the plan sent in bearing the motto "Adelphi," for the construction of a building at an estimated cost of 22,500*l*., which, together with other expenditure, would necessitate a loan of 35,000*l*. being acquired. The Council discussed the subject at some length, and eventually adopted the committee's report. The Town Clerk announced that the author of the accepted plan was Mr. J. M. Brydon, London, who received the first premium of 100*l*., the other premiated plans being those sent in by Messrs. Burgess & Oliver, London, who received 75*l*., and Mr. T. B. Silcock, of Bath, 50*l*.

TOTNES TOWN HALL.

THE Town Clerk of Totnes has explained the alleged vandalism by pulling down the ancient Grammar Schoolroom adjoining the Guildhall. He says that the building in question has been rebuilt and remodelled from time to time until the whole of its ancient character long since disappeared, except that in a cellar beneath it can be traced a portion of the old walls of the town; and that the present modernised building is not to be pulled down, but simply remodelled for use as a police-station, the cellar and remains of the ancient town wall not being interfered with. The building in question was the property of the Totnes Endowed School Governors, and on new premises being acquired for the school it was sold to the Town Council, who in turn sold it to the County Council for Devon, whose joint committee are making the alterations; so that the Conscript Fathers of Totnes are not responsible for the way in which the alterations are to be carried out. As to the suitability of the building for the purpose to which it is to be put, the joint committee of the County Council consider it most suitable, and the Home Secretary approves it.

THE ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting of the Association was held on Friday evening, Mr. F. T. Baggallay, president, in the chair.

Mr. T. G. JACKSON read a paper on the

Training of Architects.

Mr. Jackson said:—When you asked me to address you this evening on some matter connected with our common calling, it seemed to me that I could not do better than choose for my subject that of the training of architects to the pursuit of architecture. It is a subject about which more has been said and written of late years than at any time before. It is a subject, too, about which there is, perhaps, more difference of opinion among us than about any other connected with our craft. That some better system of training young architects in the way they should go is desirable seems admitted on all sides. For although the advantages of pupilage or apprenticeship are so great that they are not likely to be given up, still the student must of necessity supplement the experience gained in his master's office by study and reading of his own, and the office is and should be to him rather the place where he may expect to see put into practice the lessons he has learned elsewhere than the place where he can expect to be taught directly everything that he ought to know. He has, therefore, to join classes at art schools and to enter on a course of reading, sketching, and independent study of his own, and it is here that his troubles begin, and here, too, that he is likely to be perplexed by the totally different courses that are proposed to him.

The first nostrum that is offered him is one that is at first sight quite beside the mark—examination. To his demand for instruction the Royal Institute of British Architects replies, "We don't profess to teach you; you must get taught as you best can, but if you come to us afterwards we will examine you."

Now, the question of examination is not exactly our subject to-night, but it touches it in so many points that it cannot be avoided. For the present, however, we will pass it over, and by-and-by I shall find it necessary to say something more about it. After we have defined, with what preciseness we may, the kind of training and instruction necessary to make a man a tolerable architect, we shall be better able to judge how far the test of examination is applicable to it.

A better answer to the demand is that which you yourselves of the Architectural Association have given. The voluntary or mutual system of instruction which you have for so many years usefully carried on is now being expanded under your new scheme into a wider and more complete plan of architectural education which, if it is properly carried out, ought to go far towards supplying the want of which students complain. You are just at the beginning of a new career; it rests with you either to make it barren or fruitful; the question of its future usefulness depends entirely on the direction you give it at first starting—whether you shape it on the old lines of text-books and stale examples and conform it to the cut-and-dried rules of a hard-and-fast curriculum, or whether you guide it with a lighter and more liberal hand, and, recognising that all men are not gifted in the same way, give to your system that elasticity which will enable each student to develop any special gifts he may possess. The success of your scheme will, in fact, depend entirely on the view you take of the student's needs and of the nature of the instruction that will do him most good.

What, then, is it that the student wants to be taught in order to become an architect? In the first place, it is clear he must learn how to build well. Construction, planning, choice of material, and the proper use of it according to its nature, are not architecture, but they are the foundation of it; and, more than that, it is they that have moulded all the architectural styles that have ever really lived into the form by which we know them. But skill in construction and knowledge of building materials will not suffice to make the architect. He must not only be a good constructor, but he must know how to construct artistically as well as solidly. What architecture does for building is to give it the means of expressing itself, and of expressing itself with beauty and propriety. It does for building what the actor does for the play. The play may be written as well as you please, the repartee may be brilliant, and the dialogue sparkling; but if you drawl it out in an inexpressive monotone, you will at the utmost convey the bare meaning of the words, and you will awake no emotion. But let the actor declaim the same words with passion and feeling, and he will make you ready to start from your seat, or draw tears to your eyes. Just so with our art; two designs may be equally good in point of plan, convenience and construction, but the inartistic design, which stops with mere building, will give no pleasure and rouse no emotion; while the other, in the hands of an architect worthy of the name, arrests your attention and delights and satisfies the sense.

But though good building must precede good architecture, do not think that architecture is a sort of ornamental varnish that may be laid on to something else that is brought to it ready made. It cannot be applied to a building by way of improvement in the same way as you put gilding on to a picture-frame or butter on to bread. Your art and your construction must go together, hand in hand, from the very beginning. From the very first you must work with a view not only to strength and convenience, but also to beauty and fitness; from the first your plan and your architectural design must grow up side by side. While you contrive approaches and arrange your rooms, your mind will be busy at the same time forming a picture of the building as it will work out on these lines, and as you go on you will shift a room, or a wall or a pillar, recess one part, project another, or drill the whole into symmetry according to the architectonic idea in your mind and to the character you wish the building to have. All this will advance *pari passu*; there is no especial moment at which one can say, "Here architecture comes in." It has been there from the beginning, inseparable from the plan and construction, affecting and modifying them in a hundred ways, and being affected and modified by them in its turn. For their influence is reciprocal. If it is bad to study construction independently of architectural considerations, it is, perhaps, worse to study architectural design apart from construction. It cannot stand alone. Construction is the frame

work or skeleton on which the figure is modelled, and if you deprive it of its backbone, architecture falls into a helpless mass of powerlessness, as incapable as a jellyfish.

This, then, is what the student of our craft has to learn in the first place, and as the key to all that follows—to construct well with an artistic motive. Mere constructive skill will make him an engineer, but will never make him an architect; and mere acquaintance with architectural forms and skill in reproducing them may make him a good draughtsman, but will never make him an architect. Construction and design must be learned together, not as separate studies, but as one simple subject to be mastered by every one who aspires to be an architect.

Now, while there is abundant opportunity for learning building construction pure and simple, irrespective of æsthetic considerations, there is no school, so far as I know, for teaching construction in the architectural sense which I have indicated, and here is a want that your new studio may admirably well supply if you manage it aright. By way of making quite clear what I mean, let me make some remarks on what I saw there a few weeks ago when at your invitation I attended as visitor of the Advanced Class of Design.

Among the designs that were then produced were several that showed considerable promise. Mistakes in planning, of course, were to be found, but they were generally of a kind that experience would easily correct. What struck me as especially amiss was that the authors of these designs had seldom or never really considered how their designs were to be carried out. There were open-timbered roofs that looked pretty enough on paper, but which I was obliged to point out could not be constructed, because timber was not to be had 3 feet wide. There were arches, graceful and stately, which, for want of proper abutment, would infallibly have brought the building to the ground. But the worst was that the designers showed so little appreciation of the scale to which they were working. The drawings were all to the scale of 8 feet to an inch, and few of the students had thought what would be the effect of their details when enlarged to the real size. Some of them, when asked to sketch to a larger scale a section of the jamb of their windows or doors, were unable to do it. They had never thought about it, any more than they had about the scantling of their timbers or the abutment of their arches. Now, these are examples of design being studied apart from construction, and I should like to repeat here the suggestion I made there—that every student as he goes on with his design should make detailed drawings to a larger scale, or sometimes full size, of each piece of construction or each architectural feature. He could not fail then to know his own meaning. He would not be misled by his own small-scale drawings, than which nothing is more deceptive even to an experienced eye, much more that of a student. This year, among the designs sent up for the National Art Prizes at South Kensington was one which showed considerable ability, and was drawn in a taking way. A scroll of simple foliage, delicately touched in, filled a space over a doorway, and in the drawing looked very well; but measurement pitilessly exposed the fact that the leaves were 4 feet across, of which the author was probably quite unaware. He had been deceived by the scale of his own drawing, and had he been going to erect the building he would have had to alter his design, for with his absurd leaf the panel which it fitted would have had to go, and the whole composition would have been affected. There were submitted for composition numerous other designs where construction had been altogether ignored or evaded—domes and lanterns with no visible means of support, and so on; but I have selected this simple instance because the author had evidently to a certain extent considered his design properly and thought it out, and would not have made this mistake had he taken the trouble to make a working sketch, however slight, to a larger scale.

Another suggestion I ventured to make in your studio the other night was that besides being always required to draw details of the designs to a large scale, the students should proceed to write a short specification of the work. What is a specification? I do not mean the senseless farrago of repetitions and stock phrases that some people write, but a sensibly written document, with no unnecessary verbiage. It is simply a letter to the workmen telling them once for all what, if you had no specification, you would have to tell them bit by bit as the work went on. You forestall the innumerable questions the workmen would have to ask when the occasion arose, by writing their instructions down for them before they begin. But it serves another purpose as regards yourself. It forces you to define to yourself your own intentions. It perhaps reveals to you something in your design that will not do, and compels you to alter it; it obliges you to fix the notions that were floating in your mind, so as to admit of being put down in black and white; and it discovers to you any point on which your knowledge is imperfect, and about which your ignorance may need to be enlightened. I venture to suggest this as an excellent corrective to the tendency to fanciful and unpractical design, of which I saw signs in your new studio, and which cannot too soon be reduced to the stern rule of common sense and necessity.

Let this, then, be the first rule of your studio, that every student should make it clear in his own mind, and to that of his teacher, how his design is to be carried out—how the thing he is designing is to be made; and, if he cannot explain this satisfactorily to himself and others, he should be told that it is of no use his going on till he has cleared up the mystery and solved the problem in a satisfactory way as regards both sound construction and good artistic form.

The great importance of this becomes evident when you consider what it is that an architect is called upon to do when he has a building to erect. Unlike the painter and sculptor, he does not produce his result by handling and shaping the materials himself, but by directing others how to do it. Remember that it is your work to design for craftsmen. What you draw on paper they will have to make somehow as best they can, and if you do not know how your own designs are to be carried out, how are they to know it? As you are working out your plans and elevations, try and put yourself in the place of the clerk of the works or foreman who will have to work from them; ask yourself what explanations he would need, and amplify your details and descriptions to meet his imaginary wants. In this way you will avoid making mistakes and omissions which might upset your design, and which otherwise you might not be able to detect; and you will discover to yourself your own ignorance and see what it is you have still to learn.

And while I am on the subject of your drawing-classes there is another suggestion that occurs to me, and that is that the students should as early as possible be accustomed to put their designs into perspective. Nothing is more misleading than the habit of designing in elevation. An elevation is nothing but an upright plan, just as a plan is, if I may so put it, a horizontal elevation. Both are mere conventional representations, mere working diagrams, correct for use with rule and compass, but conveying no idea of the effect of the design. You may take it for a general rule that a building which looks well in elevation rarely looks well in perspective, and as we see buildings in perspective, and never in elevation, you will readily see which of the two ought to be first studied. My own practice, except in the simplest buildings, where I can trust my experience without trial, is always to start a perspective at the same time as the elevations, and when the building is got to look right in perspective, I work back from it to the elevations, and alter them to suit the perspective. And this I would strongly recommend to your students as the best way of shaking their confidence in geometrical drawing, and teaching them as they go on to consider how the proportions and dimensions they are adopting will strike the eye in actual work. Some of the best among the designs which were shown me the other night would have come out in perspective very differently to the intentions of their authors, and I fear have caused them considerable disappointment. It is a common joke against architects that they take in unwary clients by showy, attractive drawings, that hold out a promise which the building fails to realise; but I am sure that architects themselves are quite as often taken in by their own pretty drawings, which come out very differently in bricks and mortar from what they appeared on paper.

So much, then, as to drawing, which, after all, is not the main thing, for our drawings, it should be borne in mind, are not to be regarded as works of art, but rather as diagrams to explain the design to those who have to realise it. The design is the great thing, and the main object of an architect's education should be to train him in habits of design, to strengthen his imaginative powers by exercise and to correct his taste by showing him good models. Two things are necessary to him—imaginative power and knowledge. No one can give him the former, and if he is quite devoid of it, it is useless his thinking of being an architect. But it is not necessary to have genius in order to turn out very fair work, work which is quite capable of giving a great deal of pleasure, much more than that afforded by the efforts of genius when misdirected and ill-applied. "If you have great talents," says Sir Joshua Reynolds, "industry will improve them; if you have but moderate abilities, industry will supply their deficiency. Nothing is denied to well-directed labour; nothing is to be obtained without it. . . . I will venture to assert that assiduity unabated by difficulty and a disposition eagerly directed to the object of its pursuit will produce effects similar to those which some call the result of natural powers." Moderate powers of imagination will grow stronger by practice, by observation and by discipline. They can, in short, be educated like any other faculty.

The other necessary qualification, knowledge, depends on the student's own industry, assisted by proper teaching, and this assistance you now propose to give him. Some things he will learn from books; the history of his art can be acquired only by reading, and some knowledge of it is, of course, indispensable, while, if he has time for it, he cannot know too much. But let him be on his guard against thinking that a historical knowledge of art will do anything of itself to make him a better

architect. "A perfectly illiterate man," says Sir Joshua, "will never make a great artist;" but all the same, a man may be a very good artist without being a man of letters. It is impossible that every student of architecture should attain the same literary culture, nor is it necessary. No doubt the more you love your art the more curiously will you study its history, but do not suppose that by learning the names, dates and history of the authors of the buildings of the past you are studying architecture. You are merely following an interesting and natural course of antiquarian research, which it is most highly desirable that you should follow, but take care to disabuse yourself of the notion that it will help you in the least degree to be a better architect. Not that I would in any way dissuade you from these studies if you have time and taste for them; they are not architecture, it is true, but, at the same time, if you are nothing but an architect you will be a very dull fellow; only, distinguish carefully in your mind between the study of your art and the study of its history and antiquities, which is a totally different pursuit. As an art-student you must of course understand the sequence of styles and their characteristics, how they grew out of one another, and, in their turn, developed into something new; but in that capacity you will have nothing to do with the social history of the age of which they formed the outward expression. Your business is with the value of ancient buildings as works of art; if you admire them, analyse the causes which make them beautiful; if you are disposed to criticise them, do not be deterred by any reverence for their antiquity, but judge them fairly to the best of your powers. Look at them with your eyes open, appraise them without prejudice, try to understand them without being blinded by the charms of old association and historic interest, and in that way you will get from them all the help they are capable of giving you in your architectural training. In short, be an artist first and an antiquary afterwards, remembering that your vocation is not the study of the art-work of the past, but the creation of works of art in the present.

With this point in view, do not confine your study to old work. Watch also the current architecture of the day, so far as it is worth watching. It has always been the laudable practice of your Association to visit new buildings and works in progress, and you cannot do better than continue that practice in the future. When one does find good modern work there is something about it more inspiring and stimulating than there is about old work, however superior the old work may be. You feel that your own case is not hopeless when you see good work done by your friends and contemporaries, who are within your reach, not removed, like the great masters dead and gone, who speak to us only by their works. You there see also the application of novel materials and new ways of using the old, and you find in them suggestions for new design on your own part, and if there be any real life in the work you are studying it cannot but be enlivening to be brought into contact with real living art in your own day and country.

Bearing the same point in mind, let your reading be of a practical kind. Besides books of technical instruction in carpentry, masonry, brickwork and so on, read such works on architecture as deal with it from the constructional as well as the historical and æsthetic side. There is no better reading of this kind than is to be found in Viollet-le-Duc's great "Dictionary." His conclusions are sometimes fantastic and his judgment prejudiced, but if you read carefully his article on "Construction," which occupies nearly a volume to itself, analysing and making notes as you go on, you will rise from it a wiser man and will have got a better understanding of the nature and motives of Mediæval architecture than by any other reading I can tell you of. There is nothing comparable to it unfortunately in English, and indeed considering the mass of printed matter about architecture, it is wonderful how few books there are of any direct use to the student. Encyclopædias, dictionaries and handbooks there are in plenty, but few of them go really deep into the subject. A work that professes to treat of all known styles, ancient and modern, within the boards of an octavo volume or two, cannot be more than superficial. Even Fergusson's books, excellent as they are, capable as far as they go, are more useful to the amateur than the student.

Above all, do not try and make yourselves all at once encyclopædias of architecture. Confine your study at first, and, indeed, to a great extent all your life afterwards, to those styles which practically concern our modern use. Egyptian, Assyrian, Persian and Indian architecture are interesting studies, and no educated man would like to be entirely ignorant of them; but the knowledge which contents an ordinarily educated man will suffice for you. Dare I say the same of Greek art? I approach the question with some trepidation, but, to speak honestly, I should say that it may safely be put on one side by the student and regarded, even in his riper years, rather as a splendid illustration of what art can achieve under certain conditions than as having any direct bearing on his own work. With Roman art it is different; as the system of Roman polity permeates our civil constitution, and the roots of Roman speech intertwine themselves with our language, so did Roman architecture, in its progressive transmutations, give birth to all modern European styles, both those of the Middle Ages and those of the Renaissance. Roman art must be studied, though to my thinking—I say it with diffidence and the consciousness that many of my hearers will disagree with me—it is most interesting when regarded in its parental relation to the styles to which it has given birth, and which will naturally be the main objects of your studies.

But it is not by reading books and studying illustrations that you will learn practical architecture. Reading about things is very different from seeing them; you will learn more by one visit to an actual building than by pages of description. Accustom yourself from the first to regard your books only as guides to teach you what to look for in real buildings, and follow up any course of reading by going to see for yourselves the things you have been reading about. In the same way do not think that by drawing in an architect's office you will ever learn how designs will come out in reality, or even that you will thoroughly understand the meaning of your own drawings. Go, if you can, to the building itself; see for yourself how the details work out; how the different parts are constructed, what difficulties they present and how the workmen surmount them. I have always recommended my pupils at the end of their term to put themselves for a season under a clerk of works, and help him to set out the work and direct the workmen. I cannot say they always take my advice, but those who have done so have not failed to benefit by the practical knowledge they gained.

(*To be continued.*)

Mr. H. O. CRESSWELL proposed a very hearty vote of thanks to Mr. Jackson, who that evening had done them an inestimable service by his calm and quiet consideration of their scheme, and by giving them the benefit of his ripe experience. He wished they had had that benefit while they were discussing the scheme, but it was not too late to embody the ideas thrown out by Mr. Jackson. They had not taken up the scheme till after the deepest thought and most earnest consideration had been given to it. They had not put it forward as a perfect scheme, nor had they any thought that it could not be improved. Mr. Jackson's suggestion that in working out designs details should also be worked out, had been attended to, and it was an instruction that it should be done. He cordially endorsed the suggestion that pupils should begin as early as possible to study perspective. Many showed a great ignorance even of the very rudiments of perspective. The suggestion as to the workshop was most valuable. It was also suggested at the previous meeting, though it was not made clear whether they were to run one themselves, or how it was to be managed. Visiting a series of workshops, he believed, would be advantageous. The question of examinations could, he thought, hardly be discussed by the Association. They, taking things and taking pupils as they were, had formulated their scheme. It was impossible for them to consider whether the examinations should be swept away or not. They had to recognise the examinations as a fact. If they did not prepare students for them, the students would go elsewhere. That was what had happened, and their students and attendance of the classes had fallen off previous to the starting of the new curriculum. One most important point of the scheme was that pupils should begin their studies as soon as they entered the office, and by continuous and assiduous study get their knowledge without recourse to cramming.

Mr. F. R. FARROW seconded the vote of thanks. He expressed his cordial agreement with Mr. Jackson's views about cramming. He had had some experience in the matter, and he endeavoured as far as possible to mitigate the evils of such a procedure, and to advance students with as little as possible of the cramming system. On other points he perhaps was not in perfect agreement with Mr. Jackson. A knowledge of the history of architecture—not of dates and of artists' names, for that was not history at all—in other words, the record of how the men of the past dealt with the problems of art was necessary for the purposes of design. Originality could only come by acquaintance with the artistic work of the past as well as of the present. In designing, two mental processes were at work. The one direct and conscious in the dealing with the problems of the actual requirements; the second a semi-conscious drawing on what was stored up in the mind. This was the only explanation of how ideas instinctively suggested themselves to the designer in the course of his work. Mr. Jackson's buildings were an instance in point. His inspiration could not be traced to any building or example, but suggested his acquaintance with the work and buildings of all periods. He did not think they could understand Roman work without a thorough study of Greek work. The late Wm. Burges had told them that from Greek art they could learn principles that the study of Greek art was absolutely necessary for a man to become a good architect. Mr. Jackson, he thought, would be pleased to hear that the most of their new students had come to learn architecture rather than study for examinations. Some of course intended to go up for examination.

Mr. REGINALD BLOMFIELD said he was glad to hear that all the students were not making the examinations their aim. Mr. Farrow's remarks on Greek art were most interesting, but the burning questions of examination and education were uppermost. They (the party he sided with) had been asked why they did not join in helping the Association and its work. The question, Is architecture an art or profession? was one of facts and not of names. After mentioning the various views, Mr. Blomfield said they looked on an architect, not as an unpractical man, but as a most practical man, who could do nothing unreasonable. They would discard from architecture the work of the quantity surveyor, and that business generally understood as the commission agent's. They would have students study materials, and work in the workshops, studios of sculptors included. It was desirable that there should be a proper school of design, and that, he thought, should be carried on by the Academy of Arts. He hoped to see a compact body of skilled men who would carry out the excellent motto of the Association, "Design with Beauty, Build in Truth."

Mr. S. VACHER said he thought pupils should have one day in the week to work in the contractors' workshops. Nothing would be gained by visiting workshops in swarms. Many of the students of architecture should be told after the first year or two that they were not fitted to become artists, and that they should take up something else. Some would make excellent draughtsmen, others craftsmen, &c. The Institute examination questions were not practical ones. Architects did not really begin to learn till they began to practise. Would it be possible for young men who had secured a commission to pay fifteen guineas, say, to an architect like Mr. Jackson to examine their designs?

Professor KERR said he had come expecting to hear some allusions to the question, Is architecture an art or a profession? now agitating the profession. He was glad to have heard the views of Mr. Jackson and Mr. Blomfield. He had never made any contention to be a great artist. Generally speaking, he would advise young men not to strive too earnestly after such a position. What the public of this country wanted was a certain amount of grace conferred upon their buildings, the buildings themselves being previously thoroughly well designed. Of course, when a genius was met with it was a duty to give his ability fair play, and to encourage him to the utmost. Generally speaking, the average man—and of course the meeting was composed of average men, with a few exceptions—would find, when he took up designing, that wisdom lies in moderation even in artistic aspiration. There was an entire misconception of the feelings and views entertained by the Institute. There was no disposition to discourage art, but the contrary. If Mr. Jackson and the other gentlemen would join them, they would give them as much rope as they liked in regard of art. The examinations he had nothing to do with, except the voluntary one which Mr. Vacher told them he had passed. Mr. Cates's examination—well, it was Mr. Cates's from beginning to end—he had nothing to do with it. Mr. Cates was a perfect man of business, a perfect representative of the three elements that had offended Mr. Jackson, Mr. Norman Shaw, &c. They should bear in mind that they were servants of the public.

A VOICE: No, no.

Professor KERR: No? I will speak, then, to those who consider they are. He did not, he said, mean to disparage art at all. He had defended it all his life, when a boy foolishly perhaps. The public opinion of the cultured classes of this country wanted their houses thoroughly well planned; secondly, the body corporate of the building well built; thirdly, in moderation as much substantial grace as could be put on the building. If they put too much, he would leave them to settle the matter with their employer. If they could put a moderate amount of grace on a building, there was an immense gulf between them and those who could not. Mistakes were made by the most artistic painters when they touched on architecture in their pictures. It was astonishing what even a small amount of good art would do for architecture. Mr. Cates had virtually said that in other societies of a kindred nature to the Institute, they found a bar to entrance identified with an examination of some sort, and he said it was desirable to place this bar at the door of the Institute. Who was to say "No"? He (the speaker) was particularly anxious it should not be carried too far; he would even grant that it seemed likely it would be carried too far. But do not let them disparage their colleagues for simply endeavouring to make a respectable appearance before the public. He could never forget that in his young days the Institute was a learned society. In a certain way it was on a level with the Royal Society and the Society of Antiquaries. Whether it was so now he would not say, but if Fellows were to be admitted by examination, it would not have that level any longer. It was well enough to examine a young man for associateship. Young men failing to pass could be told to come again in another year. But who could repair the injury done to a man who had been ten years in business? They would not submit to it. That a proper test, and one involving no indignity, so he would call it, should be applied, he granted. Professor Kerr expressed great satisfaction with the doctrines promulgated by Mr. Jackson as to education. Nothing could be more sound, practical, or more deserving of the greatest consideration of the Association. In what Mr. Jackson said, he represented the views of the Institute to the letter. As to the scheme of education started so courageously by the Association, it was not for him to express any opinion. He agreed with Mr. Jackson that the way in which it was started was vital. They must not expect too much at first, but go on steadily for a year or two, and see what could be done and what could not be done. Their President could not take too serious a view of his position in regard to it. Looking at the whole question, the Association was to be congratulated on the boldness, earnestness and intelligence with which it was being conducted.

Mr. E. S. PRIOR disagreed with Professor Kerr. If architecture were such as he represented it to be they should lay it aside altogether for their own peace of mind. The way to serve the public was to lead them to a better idea of architecture. Professor Kerr said he would like them to come back. At the time they had been asked to come back they, after consideration, expressed to the Institute their distrust of the examinations as fraught with disaster to architecture. This was a vital objection with them, and the Institute answered by saying that they could make no change; that the examinations were included in the charter. But Professor Kerr's remarks had, he thought, nothing to do with the subject for discussion that evening, in other words, education. Architectural education might be viewed in two senses, as an end for its own sake, or as a means as now generally understood for passing the examinations. A society wishing to do the best for its members that desired to become architects should have nothing to do with what he would call general education, but only with education for the purpose of making an architect. When first he was a pupil his master told him it was no good trying to be an architect unless he could be a good architect. There might be humdrum doctors or lawyers, but not humdrum architects. Architecture was a serious operation; everything must be sacrificed to it and the knowledge of it not acquired in a humdrum way. That was one of the first lessons he learned. Next, the learning to draw was merely learning a shorthand method of representing what a building was really going to be. As to books, his master gave him Viollet-le-Duc's book, but said it was only archæology and would not teach him architecture. Knowledge of construction, he was told, would come in time. It did come in time. His master sent him off to act as clerk of works for one of his buildings. He had supposed there was a great mystery in construction, but there was no mystery in it at all. It was all a matter of common sense. There was no science of construction; it was the experience of construction found out by a man working with his own hands. He was the real artist who worked with his own hands, and not the man who sat and worked in his office. The architect must make himself thoroughly conversant with his work. No such knowledge could be got from books; it must be got by working by hand, by continually seeing work done and by mixing with workmen. Since those days these impressions of his had deepened, and it was his opinion more than ever that an architect must devote himself heart and soul to his work. He could not follow Professor Kerr in his definition of an architect, a matter dealt with by Mr. Jackson, that an architect was a three-legged animal—an ass, a horse and a mule. An architect could not be a commercial man, nor a professional man only striving for a living and an income. The education started by the Association should be a true education to form men for a reality and not for a sham.

Mr. E. PRIOLEAU WARREN objected to several of Professor Kerr's opinions. Examinations no doubt afforded the best facilities for those who wished to make a respectable appearance before the public, but he hoped none would have that aim. Everyone had in some way to be a servant, but he objected to their being the servants of the public, and most entirely protested against the expression if it meant subordinating their own taste to the whims of the public. He was glad to find the Association prepared to take up an independent position in education, and was not aiming at becoming a cramming school for the Institute examinations. A real architect knew he was an artist. It was not supposition. An inferior architect indeed was precisely as much entitled to consider himself an artist as the inferior painter or sculptor.

Mr. STATHAM said there was a difference between houses, pictures and statues; houses were lived in. It was somewhat important that those who designed buildings should be able to save us from bad drainage and other faults of construction. The progress in sound technical knowledge was in a great measure due to the movement for holding examinations.

The PRESIDENT remarked that they had had the pleasure of hearing the views of the memorialists from Mr. Jackson and Mr. Blomfield. The examinations had been started, and provision had to be made for them, but it was a mistake to suppose the scheme was only meant as a preparation for the examinations. He then put the vote and it was carried by acclamation.

Mr. JACKSON, in reply, said Professor Kerr had not removed any of his objections to the course the Institute had taken. The view he had always taken of architecture was, that grace could not be added to a building; construction and design must go hand-in-hand. If education was needed for architects, still more was it needed for the public. It was the business of architects to teach the public by putting good work before them and not pictures, as it was well known the Architectural Room at the Royal Academy was never entered by them. Why should architects more than other artists be a close body? He could understand an Institute of Architecture, but not an Institute of Architects that was a close body. It was injurious to the Institute. He would like the distinction between architects and builders done away with. Nine-tenths of our buildings were not designed by architects at all. Why trouble about the other tenth? What did the Institute intend to do with the majority of those buildings? Should not the Institute be composed solely of architects? But was it? If an architect took a right view of his art, he should give his whole time to it. Many a man called himself an architect and surveyor. If a barrister worked as a solicitor he would be disbarred.

INSULATED CONDUCTORS.

A PAPER was read by Mr. W. H. Preece, F.R.S., on "The Specification of Insulated Conductors for Electric Lighting and other Purposes," at the meeting of the Institution of Electrical Engineers. In this paper the fallacy of the present mode of specifying electric light conductors was exposed, and a new standard of insulation, based on the well-known qualities of guttapercha, was proposed. The qualities of the numerous insulating materials now in the market were measured and determined in this new standard, and it was shown that any classification of cables should be based on the pressures to be resisted, and should depend on the thickness of the insulating wall. The introduction of cheap and nasty cables, owing to competition and the absence of specification and inspection, was strongly commented on. It was shown that all danger was eliminated by the use of proper material and proper design.

Correspondence

Architecture—A Profession or an Art?

SIR,—Is not your correspondent "Phil-Artes" filled with a sort of superstitious faith in the virtues of an architectural society? As far as I can discern there is not the least necessity for the confabulation he proposes between deputies from the existing societies and Royal Academicians. If by some fortuitous combination of circumstances they could be brought to an agreement about a brand new society, where would be the gain? Could any society aid in discovering clients or ensure that commissions would be equitably distributed? The only advantage that can be derived from an organisation of the kind desired by "Phil-Artes" would be a further cheapening of assistance. At the present time, thanks to the action of the societies, it is easy to find assistants who are glad to work without salary. As one applicant of the kind said to me, "How are my friends to discover that I am not well paid? and at any rate I am gaining experience." When the market is stocked in that way, clerks who are not temporarily employed, must accept a lower salary than hitherto was to be secured. By what operation of a new and universal society would it be feasible, if it were desirable, to extort services at a less rate than is now generally paid? The question of education is a bore to most men, for it appears to be interminable; but it is the stock-in-trade of all architectural societies, and if it were set aside their real worth would be apparent. As long as office expenditure is diminished by the prevalence of education, I suppose architects have no right to complain. Fortunately, it is not necessary to belong to a society in order to have the choice of excellent and cheap assistants.

The new society which "Phil-Artes" desires to see set up would necessarily resemble those which exist. That is to say, the majority of the members would pay in order to derive advantage from being inscribed in the same list with the minority. If Mr. Norman Shaw would accede to the appeals and join the Institute, the subscriptions could be raised at once. It would be well worth a couple of extra guineas a year to be able to boast of fellowship with a gentleman of his eminence, and the wise men of the Institute would not fail to utilise the opportunity presented by so fortunate an accession. But as Mr. Norman Shaw has contrived to do good work without any help from a society, why cannot other men, although endowed with less power, imitate his example? From his letter I fancy "Phil-Artes" must belong to a society like many, and has suffered inconvenience in consequence, but I fear the taking-up with a new society would be like the change from the frying-pan to the fire. No society will enable him to get over difficulties, or will find him clients to propose them. His best plan, I humbly suggest, will be to imitate—Yours obediently,

AN UNKALENDERED ARCHITECT.

The Ordnance Survey and Archæology in Ireland.

SIR,—That part of the address of the President of the Royal Irish Academy in your last number which relates to the Ordnance Survey must amaze all those who are old enough to be acquainted with the facts of the case. There was a time when Bishop Reeves, who delivered the address, looked up to the late George Petrie as his father in archæology, and used to confess his filial obligations openly in Dawson Street and elsewhere. He was not afraid to sympathise with Petrie and his friends after they were treated most shabbily by the Government in connection with the Survey. But now all is changed, and his lordship has become oblivious of the transaction. The Ordnance Survey, it appears, "has conferred many benefits directly and indirectly on our country, and among them the purification of the Academy traditions and the infusion of fresh energy into its constitution. It gave an impulse to patient investigation and inductive conclusions, and it fitted for after-life a body of men who, trained in the strictest discipline of mental investigation and exactness, were prepared, when their temporary engagement was concluded, to be the missionaries of sound reasoning and dispassionate judgment in the application of the arts and sciences. It was in this school that Petrie found encouragement and O'Donovan employment."

Your English and foreign readers must be puzzled when they find so many results attributed to the operations of a Survey which they believed was carried out by officers and men of the Royal Engineers. It may be well therefore to inform them that Dr. Reeves, whose description is most indefinite, was not referring to the measurements of the country by chains and theodolites, but to another work which was not contemplated when the Survey was commenced. That supplementary work was described by Lord Brougham as "a corollary to the Survey, more valuable than the Survey itself," but it was never completed, and the advantages which, as Dr. Reeves supposes, issued from it are therefore only imaginary.

It originated, strange to say, out of the necessities of orthography. Ireland is not only divided into provinces, counties, baronies and parishes, but into townlands, which vary in size from single fields to large districts. The Royal Engineers, or Sappers as they were called, soon found great difficulty in respect of the names of the townlands. The tenants supplied names which were not confirmed by the owners and their lawyers; sometimes the names were given in Irish, sometimes in English, and occasionally in a mongrel combination. A denomination of twenty syllables in Irish must have sounded as strange gibberish to the privates and sergeants of the Sappers, who were generally Englishmen, and it is easy to imagine the mess they got into in attempting to write the words. But it was known to the heads of the Survey Department that the townlands were a topographical puzzle, to which some clue might be afforded by accurate spelling of the names. It was remembered that in 1815 there was an inquiry, and while some witnesses described the townlands as divisions of land that were commenced to be laid down in the time of James I. and afterwards by Strafford, there were others who considered they were made by ancient tribes. Davis says that "some of the townlands from their names seem to have been household lands of princes, others were hospitality lands attached to the caravanserais which the ancient Irish so liberally endowed, but most of them must be accounted for in other ways. We should be disposed to say that each was the possession of a large family or small sept, by the aggregation of many of which the great princedoms were made up. If these names and divisions are of older date (as we believe), then they either originated in, or were used for, the annual distribution of lands which was customary under the Brehon law." There was no man better fitted than Captain Larcom, R.N., who had charge of the preparation of the Ordnance maps, to appreciate the importance and interest of the most exact spelling of townland names, and he prevailed on the authorities to allow him to engage experts for that purpose.

The new department was placed under the charge of George Petrie. He was known as a landscapist and archæologist who was familiar with all parts of the island. Petrie was also a pioneer of the school of scientific archæology and was most careful in weighing evidence. His character was formed long before his appointment on the Ordnance Survey, and it is unfilial if not absurd for Bishop Reeves to suggest that Petrie owed anything to his co-operation with sappers and miners. John O'Donovan and Eugène Curry were, however, the chief experts, for they were masters of the Irish language. The former had commenced the preparation of his Irish grammar

in 1828. It was my privilege to have been united with O'Donovan in some archæological investigations, and I can say that he was employed on the Survey because he was qualified for the post that was offered to him. He was not taught by the sappers. In Ireland he was recognised as the first of Celtic scholars, but he was modest, and often told me that he was far behind Jacob Grimm in knowledge of the relations of Irish to other tongues. But great as he was as a linguist, I believe that the bent of his mind was towards topography. Like Antæus, he was strong when he touched the ground. Dr. Reeves and many others who knew O'Donovan as a translator, editor and commentator may be amazed when I say that if Fate had placed him in Germany or France he would have been the first geographer of the age. To bring out his powers to their fullest extent it was best to begin with something on the earth's surface. Anything he saw upon the ground he remembered, and to mention a fragment of an old wall was enough to draw a history from him. Ireland produces strange geniuses like O'Donovan, and as the sappers were able in every village to find barefooted boys to work out their areas (I believe Dr. John Tyndall's scientific powers were first exhibited in that way), they also found no difficulty with higher requirements. In O'Donovan they had a compound of the topographer, philologist and archæologist ready-made for use. His relative, Eugène Curry, was a man of another sort. He possessed one of those oppressive and mysterious memories that are found only among the Celts, and which seem to reach back for centuries. As an Irish scholar he had the tenderest conscience for details, and I am afraid the substitution of one letter for another in spelling, if he afterwards fancied he committed an error, made him suffer pangs of remorse. To say of such a man that he was taught exactness on the Survey, plainly shows that Dr. Reeves's memory has not grown tenacious under the weight of a mitre.

The truth is that with a most trifling sum Petrie was able to do wonders, because he was able to utilise men who, like himself, stood in no need of training by Ordnance lieutenants. Why had not Dr. Reeves the courage to state what did occur, and why did not the members of the Irish Academy insist on a more accurate version? Was the presence of a Lord Lieutenant supposed to make it necessary that the history of the affair was to be related as if it had been composed by a clerk in one of the circumlocutory offices?

As Petrie and his company of friends have gone to join the Vallanceys, Bethams, Ledwiches, O'Connors, O'Briens and the rest of the imaginative archæologists, it does not, however, matter much to say in public they were fitted for afterlife in Mountjoy Barracks. Their countrymen neglected them during their lives and are not likely to be anxious about their reputation. But there is a subject on which they were interested, and which is of much importance to living Irishmen, that was in the most mysterious way ignored by Dr. Reeves. Can any reader, from the address, imagine that part of one imperfect volume represents the labours of the archæological department, with the exception, of course, of the correct spelling of the townlands? The Ordnance memoirs were to relate to the geology and social condition, as well as to the archæology of the counties, but the appearance of a single volume frightened the Government, and the publication was summarily suspended.

Amphora cœpit
Institui; currente rota cur urceus exit?

Dr. Reeves did not inform the Academy of so melancholy an ending to the labours of Petrie and his band of archæologists. Nor did he suggest to the Lord-Lieutenant that some use might well be made of the four hundred manuscript volumes which were produced for publication. The archæological part of the Survey thus ended in a most discreditable fiasco. Is it any wonder that after such a fate for his labours O'Donovan should have told me that he had resolved to keep his children from learning one word of Irish? There is no danger now to arise if all the information were published, and the President of the Royal Academy might well have drawn attention to the subject.

There is another and no less disagreeable matter which must also be noticed. The Bishop says that through the Survey the Academy traditions were purified. Can he have forgotten the discussion which took place over the publication of Petrie's first volume on the Round Towers, and how many members of the Academy insisted on claiming the copyright because the author was awarded a prize that was offered for an essay by the Academy, and the difficulty with which the subject was settled? Poor Petrie did not attempt to test the justice of the Academicians a second time, and in consequence the rest of his great work which represented so many years of toil and so much enthusiasm was never made public. His fine woodcuts were used to illustrate a theory which Petrie would have abhorred.

Again, does the Bishop forget the circumstances attending the election of John O'Donovan, and how Academicians who were jealous of the reputation of the body were compelled to go about and solicit members not to degrade the Academy before foreigners by rejecting a man whose name was known to all those who were engaged in tracing the branches of Sanscrit? Yet at the time it was notorious that there were many Academicians who were unable to spell English words. The objections to O'Donovan were three:—He had worked for the Academy; he was poor; and he was a Romanist. The two cases afford an odd commentary on the Ordnance purification.

I must apologise for writing at such length. But as I know *The Architect* is read by archæologists in England and elsewhere, I should not like them to imagine that the address by his lordship of Down, Connor and Dromore, which you printed last week, embodies all the facts about the indebtedness of the foremost Irish archæologists of the century to the training they underwent under the direction of the Ordnance surveyors, who were little better than machines. It is a libel on men who merited to be treated with reverence by all members of the Academy. Let any critic compare the work done by Petrie and his friends before they accepted their unlucky appointments with their work of a later time, and I defy him to trace any improvement which can be attributed to the Ordnance Department. With quite as much justice the Bishop might have claimed the marvellous poetic faculty of metempsychosis of Clarence Mangan as being derived from the honest but prosy sappers, because he was a clerk in the Department, or the enterprise of Mr. George Smith, with whom "the Academy went hand in hand," in buying antiquities, because he sold Ordnance maps. Loyalty is an excellent thing, and it is well to display it, but it becomes ridiculous when it leads people to believe that uninformed soldiers are the best teachers of archæologists.

I feel I cannot expect much grace owing to the length of my communication, but you and your readers may rely on the accuracy of all it contains. I am quite confident that his lordship the President of the Irish Academy will admit that I am right throughout, and will not hazard the contradiction of one word in this letter. He knows all the facts, but I suppose he considered it was necessary to display his admiration for officialism, and to endeavour to conciliate the scientists in the Academy, who would keep all archæologists out of the President's chair. *Vitium fuit, nunc mos est, adsentatio.*—Yours obediently,

T. C. D.

GENERAL.

The Liverpool Autumn Exhibition closed on Saturday. The total receipts amount to 3,796*l.*, as against 2,985*l.* last year, the sales of pictures amounting to 7,327*l.*, or 1,200*l.* more than was received during the exhibition of last year.

The Dean and Chapter of Rochester Cathedral are about to make an appeal for funds to complete the restoration of the cathedral in a less leisurely and more thorough manner than hitherto has been possible.

Mr. Marr, C.E. (Jenkins & Marr), of Aberdeen, has been appointed architect to the Governors of the Robert Gordon College.

The Designs of Mr. Thomas W. Cubbon, architect, of Birkenhead, have been adopted for a Wesleyan church and schools about to be erected at Ambleside, in the English Lake District.

The Rev. F. F. Grensted will read a paper, entitled "Egypt as a Home of Early Art," at the meeting of the Liverpool Architectural Society, on Monday, the 21st inst.

A Church, designed by Mr. Brooks, is to be built in Dover, which will be the largest in the town, and will cost over 10,000*l.*

Mr. Lennox Canning, A.R.I.C.S., Mem. Inst. Austrian Engineers, has been appointed engineer to the Town Council of Bloemfontein, Orange Free State, South Africa.

Plumstead Church, Norfolk, has been destroyed by fire. The nave, chancel and tower were all recently restored, and the bells rehung, but the edifice must now be rebuilt. A beautiful carved wood screen has also been destroyed. The registers date from 1558.

In Connection with the Architectural Section of the Glasgow Philosophical Society, Mr. Alexander M'Ara, at the last meeting, read a paper to the members on "Limes and Cements," with experimental tests.

At the Fortnightly Meeting of the Carlisle Architectural, Engineering and Surveying Association, Mr. Higginson, architect, read a paper entitled "With the Society of Architects in Belgium." The chair was occupied by Mr. Howard Smith, the city surveyor.

At the Annual General Meeting of the Manchester Association of Engineers the chair was occupied by Mr. Samuel Dixon, in the absence through indisposition of the President. The principal business was the election of officers for the ensuing year. Mr. G. B. Goodfellow, of Hyde, was unanimously elected to the presidency, vice Mr. J. West, M.I.C.E., who retires after having held the office for two years.

The Architect.

THE WEEK.

An account of an action taken by the representatives of the late Mr. John Rhind, architect, of Inverness, against Sir John Ramsden lately was given in the *Architect*. The sum that they sought to recover was 2,034*l*., balance of fees for architect's work at the mansion-house of Ardverikie and other works on Sir John Ramsden's estate. It was contended that Mr. Rhind had originally estimated the cost of the mansion at Ardverikie at 12,758*l*., whereas it had cost upwards of 32,000*l*. Sheriff Blair, who tried the case, found that no agreement was made between the parties as to remuneration, and that there was no warranty by Mr. Rhind that the works should not exceed the estimates. It was decided that 2,300*l*. was fair charge for the work done, and, after deducting a sum of 1,600*l*. paid to account, judgment was given for the balance of 700*l*., with costs. The decision was appealed against in the Court of Session, but it is understood the appeal will be withdrawn. As some amends to justice it is to be hoped the expenses which will have to be paid will fall entirely on the defendant.

Among the numerous and varied undertakings of the Cardinal Lavigerie is the erection of a cathedral in Tunis, and the design will be obtained by competition. The interior is to measure 60 mètres (196 feet 9 inches) by 27 mètres (88 feet 6 inches), and is to comprise nave, aisles, choir and sanctuary. There is to be a crypt with access to the sanctuary. The competitors are allowed a free choice as to style; at the same time it is suggested that a reproduction of one of the ancient Christian basilicas or of one of the ancient temples of Tunis would have suitability. The limit of the expenditure is fixed at half a million of francs (20,000*l*.), including architect's commission. A similar sum may also be assumed as obtainable at a future time for decoration, works of art and furnishing. The successful competitor will be entrusted with the execution of his design, and he will have to direct the works in person or by the agency of an architect who will have to be approved by the ecclesiastical authorities.

It is a pity contractors cannot be persuaded to settle their disputes without the agency of a public trial. A case came this week before the Chancery of Lancashire which, if followed out in the ordinary way, is likely to leave all the parties much poorer than they are at present. The whole affair turns on the penalty clause. On June 12, 1890, Mr. R. H. Heenan, the plaintiff, entered into a contract with the Cheshire Lines Committee to widen certain viaducts. The contract was to be completed in March 1892, and the penalty of delay was 50*l*. a day. The plaintiff entered into a sub-contract with Mr. Ives, the defendant, and under that sub-contract there was a special provision for punctual performance. The case for the plaintiff was that Mr. Ives had not fulfilled his contract duly in respect to performance, that he had made default, that Mr. Heenan had exercised his power of forfeiture and determined the contract, that he sought to enter into possession in November 1891, and was resisted by Mr. Ives and his workmen. The plaintiff obtained an injunction of which he now sought the continuance. He was desirous to restrain the defendant from preventing him from taking the execution of the sub-contract entirely out of the hands of the defendant, and from taking possession of and retaining, either for his own use or for the use of the parties he may employ, all or any materials, engines, or implements which the defendant may have upon the works mentioned in the contract. On the other hand, the defendant charged the plaintiff with being the cause of the delay, and asserted that the materials supplied by the plaintiff for the execution of the contract were not supplied in proper time, and that the quality of materials was bad. Sir F. H. Bristowe, Q.C., after hearing the statements of counsel, said that when the case was before him on the last occasion nothing was said concerning delivery of goods by the plaintiff to the defendant under the terms of the contract. Nothing was said to him about the correspondence, which went to show that there had really been a dispute between the parties concerning the delivery, and that the defendant had been complaining month after month as to the supply. The Vice-Chancellor would express no decided opinion as to whether or not the plaintiff was in the right, but he decided to let the present motion stand adjourned, making no further order. If the plaintiff and defendant are as wise as business men, and especially contractors, ought to be, they will take advantage of the respite and come to terms. They are not likely to have a more satisfactory settlement made for them by the judges than they can arrive at by themselves.

The Glasgow Corporation have arranged for a course of lectures in connection with the Arts and Galleries Trust. On Saturday Mr. Macgillivray, the sculptor, gave a lecture upon "The Sculptures of the Parthenon," with lantern illustrations. He began by an historical survey of the period in which the Parthenon was built and the government of the time. He described its magnificence of colour and decorative detail. The effect, however, was not bizarre. This was avoided by the skilful use of the colours and materials in their quantities and tones. Reverting to the present, the lecturer said we must all regret the almost total disappearance of all that had been described. He continued his historical survey by tracing the various changes from Pagan to Christian uses, and illustrating these changes down to the destruction of the Parthenon. Dealing next with the sculptures, he described them as distinguished by grandeur in the three great elements of the plastic art, namely, line, mass and movement. In the general character of the work there was nothing personal in the local sense. Their expression was eminently normal in quality and abstract in kind. The technical treatment of the material which they displayed had never been surpassed, nor had the spirit of nature ever been so wonderfully embodied. They must have been the production of a climax in the art of a school which had arrived at maturity, for we scarcely distinguished in them the traces of the archaic work by which they were immediately preceded, nor any sign of the pretty, almost effete, style which was presently to follow in the art of Praxiteles. After describing the marbles, Mr. Macgillivray said that to attempt to notice in detail the fragments of these great sculptures would lead to questions of doubt and argument unsuitable for so slight an essay. It would be equally unprofitable to attempt any critical notice of the pieces, as the result would probably be a wordy pile of admiring phrases. Without further ado therefore he left the subject and its charm, hoping that those to whom it had been introduced might desire to have further acquaintance with it. In conclusion, the lecturer expressed the hope that the new Art Galleries about to be erected in Glasgow would contain a complete collection of casts from the fragments existing of the sculptures of the Parthenon.

M. Rodin has made another attempt to satisfy the Commission having charge of the scheme for a monument to Victor Hugo in the Panthéon of Paris. As is usual with all attempts to apotheosise the poet, earth, air and water are dragged in as his slaves. Hugo is shown as supported by a rock against which he leans; three female figures with ugly faces are borne by waves to his feet, and above his head is a figure with vast wings that is supposed to represent heavenly inspiration, and therefore places a hand on his forehead. There is nothing that at first sight appears to be symbolical of Hugo's writings in the whole mass of plaster. There was more of the volcano (with, of course, French fire) in the man than of air or ocean, although Baudelaire said that Hugo's voice became deep in rivalling the sound of waves. Or if there must be something figurative, why not have a lion to represent the great sounds of the writer, which could draw so much money from French publishers, and a dove or something with "a monstrous little voice" to suggest the courtier who could write such humble letters when he sought the honour of a King of Prussia's patronage? M. Rodin is a man of genius, but he seems to have gone for inspiration to critics like Baudelaire, who could work themselves into frenzies of admiration, instead of judging Hugo by the lights that nature gave the sculptor.

ARCHITECTS' DIPLOMAS IN ITALY.

AS it will be necessary, if merely out of courtesy, for the French Government to express an opinion on the desirability of making the possession of diplomas a necessity for the practice of architecture in France, many inquiries have to be instituted. M. ACHILLE HERMANT was appointed to ascertain the conditions under which Italian architects work, and he has completed his report. It is hardly necessary to say, for the fact was generally known, that in Italy people believe in diplomas, and M. HERMANT can therefore only corroborate and give a sort of official endorsement to evidence that was plain to all intelligent travellers.

The position of Italy in relation to the question that was to be investigated is not difficult to understand. Architecture was one of the arts which had declined among a people who were the descendants of those who might be said to have recreated all the arts, and more especially the art of building. What use was new architecture in cities which were said to be the most appropriate refuges for all who had no ties to bind them to the world? As late as 1868, we find Professor DONALDSON, who was disposed to take the most favourable view of Italian work, saying, and no doubt with much sorrow, in his report on the Paris Exhibition, "The architects of Italy are not apparently animated by the same energy and brilliant qualities as distinguished their colleagues in the other departments of the fine arts. In their best drawings they look back upon the past." The latter words were applicable to others besides the architects, for it is not so long since Italy seemed to produce nothing but antiquaries among the educated classes. There was no great demand for new buildings during many long years, and the designs which were prepared for them were in art what the *libretti* for operas were in literature. The revolution in politics was not without effect on architecture. When the old order of government was changed, one of the results was seen in the eagerness with which new buildings were undertaken. It seemed as if Italy wished to manifest independence in that way. As generally happens, whenever sentiment gets the upper hand of prudence, more buildings were erected than were necessary, and many losses followed. It is possible also that several times the architects and builders were more distinguished for courage than for experience, and from want of training they caused accidents. But all these circumstances were to be expected in a country where the people were without the practical sense which comes from devotion to business, and to whom dishonesty was occasionally as excusable as punning, and overreaching the height of felicity.

Simultaneously with the zeal for building, the new conditions of life were exemplified by the development of all corporations and societies that could be utilised for modern purposes. If the architects at the time of the unification had been banded in any great association, they could easily have obtained approval of any proposals they put forward with the object of improving their profession. But as there was no union among them, the position of guardian to architecture was, without delay, assumed by colleges and other educational establishments, and there was no power to prevent the exercise of so much authority. The successive Governments were only too glad to allow the exercise of that kind of responsibility which made no demands on the straitened treasury. The people were too ignorant to be able to understand the limits of the teachers' powers. They knew that formerly Italian artists gained reputation through ways that were not direct, and accordingly it did not seem remarkable that after a course or two of mathematics or chemistry a student should be considered as competent to stand forth as an architect.

It must, however, be admitted that the curriculum that has to be gone through contains much it is advantageous to know. At Naples, where the people are supposed to take life easily, the lower and higher courses would take seven years to go through. In the first year the subjects are mathematics, Italian literature, universal history, elements of architecture, drawing, modelling and perspective. In the second year the subjects are continued, with the addition of general physics. The third year's courses comprise mathematics, chemistry, universal history, application of the orders of architecture, ornament, perspective, and the history of art. The first year of the advanced course is devoted to descriptive geometry, analytic geometry, graphics, mineralogy and geology, applied chemistry, elements of architectural styles, application of perspective to architectural details, interior decoration. The second year's work consists of applications of descriptive geometry, theory of mechanics, graphic statics, technological physics, developments of architectural projects, application of perspective to exterior and interior views, æsthetics and history of architecture. During the third year the subjects are applications of descriptive geometry, applied mechanics, applications of graphic statics, construction, topography, jurisprudence, architectural composition and restoration, perspective exercises. The fourth year's work is a continuation of most of the preceding courses in applied mechanics, construction in metal, technical architecture, jurisprudence, composition and perspective. After going through so large an amount of technical instruction, a student would, no doubt, be competent to begin work in an architect's office; but the people consider the courses are adequate to enable any one to practise. A college diploma becomes in their eyes a proof of experience, and it is a master-key for all offices in which architects are needed.

In Naples a man can design a house or a shed for himself or a friend, but it is risky to do more unless he possesses a diploma. Without that document an architect cannot be employed on any buildings which are required for governmental or municipal purposes. He is no less kept at a distance by the provincial or communal administration. His evidence is likewise of no account in Courts should he appear as an expert. Public work being withheld from architects who have not diplomas, it must follow that their private practice is restricted. But if such men are not allowed to design buildings, there is apparently no restriction about construction, and they can become contractors.

The practice in Rome is no doubt intended to be shown as an example to other cities. At the present time a diploma from the schools of engineering is requisite for all who desire to practise as architects. In some municipalities it is incumbent on an architect when setting up to bring the document to the public offices and have it registered, in order that his position may be legalised. In Milan an architect must also produce a diploma as evidence that he studied in one of the institutes in Rome, Naples, Palermo, Bologna, Turin, Padua, or in the advanced technical institute of Milan. In Palermo there is a municipal register of architects, and in order to have his name inscribed in it, an applicant must produce a diploma. Apparently all that is sought after in the Italian cities is knowledge of construction, and an engineer would thus become eligible for designing public and private buildings, although he may have given no attention to the art of architecture. The municipal regulations are consequently the real cause of the inferior style of many of the modern buildings of Italy. They are produced by men who have no more claim to be considered as artists than the designers of the majority of the railway termini and bridges in England.

There may have been valid reasons for insisting on evidence of knowledge of construction in Italy. In spite of the diplomas, new buildings collapse occasionally of late years, and it is possible that with more laxity in the municipal regulations the number of catastrophes would be increased. But the conditions of France and Italy do not correspond, and the arguments in favour of a diploma in one country are not necessarily convincing in the other. Certainly it would be remarkable if France were compelled to go to Naples for instruction in administration. In the French schools there may be too little attention given to construction, but that can easily be remedied. When in practice French architects must somehow become skilled in construction, for the law is severe in the infliction of penalties for all cases of accidents which arise from want of skill, and the Courts are not disposed to be lenient.

An attempt has been made to persuade the French Government that a diploma is indispensable if architecture as an art and secure building are to flourish in the land. But it should not be overlooked that the principal agents in the agitation on the subject are holders of such a docu

ment, but they find that it has no magic power, and commissions do not come to them. The Government will, however, be able to discriminate between public necessities and private interests.

TYPOLOGICAL MUSEUMS.*

MUSEUMS may be established for different purposes, and the objects in them should be collected and arranged to further the particular purposes for which they are intended.

Technical museums may be established for instruction in art, to improve the taste of those engaged in manufactures. Of these the South Kensington Museum, with the origin of which this Society had much to do, may be taken as the type. The National Gallery, in this sense, may be regarded as a museum of painting for the encouragement of artists. In a technical museum the object is simply to collect specimens calculated to serve, if not as actual models, at any rate as examples of styles to be imitated: the historical arrangement of them is of secondary importance. Although no doubt the same purpose might be served, and the interest of the museum increased, if they were historically arranged, still it would undoubtedly be proper in a museum instituted for this purpose that the primary arrangement should be from the standpoint of art. It is not a museum for general educational purposes, as it can never have been contemplated that the whole or the majority of the visitors should qualify as manufacturers or artists; or, if it is efficacious for general education, it is only so in the sense of improving the public taste.

Next we have to consider the purposes to be served by such an establishment as the British Museum. The British Museum was no doubt in its origin pretty much what local museums have hitherto been, a collection of miscellaneous antiquities, some small, others of enormous size. The collections of late years have been enlarged and classified in historical grand divisions or geographical areas, and the additions have been made as time went on with more regard to scientific arrangement in proportion to the advance of knowledge. But it has not been collected from the first upon any system, or with a view to any special purpose, certainly not for educational purposes. It has been necessary to obtain specimens as opportunity offered, and to exhibit them in rooms that are ill-adapted for displaying them historically, designed in subordination to architectural considerations, and not with a view to the best means of arranging the specimens. As a large store of antiquities it is probably the most useful institution in the world for savants, who know what to look for and wish to study them, in order to form their own classifications and deductions. As an educational museum it is simply bewildering, and although lectures have lately been given upon the collections, such lectures are available only for comparatively few persons, and those not the working classes, who go there to obtain knowledge by examining the antiquities and forming their own ideas upon what they see. It would be impracticable ever to convert the British Museum into an educational museum. More than half the objects would have to be eliminated and the apartments altered to suit an educational arrangement. It would spoil the museum for the use of savants. I call such a museum a museum of reference, or it might, perhaps, more properly be termed a museum of research.

I hold that the great desideratum of our day is an educational museum, in which the visitors may instruct themselves. For good or for evil, it is not here the place to discuss the question; we have thought proper to place power in the hands of the masses. The masses are ignorant, and knowledge is swamped by ignorance. The relative numbers of the educated and uneducated are enough to insure this. The knowledge they lack is the knowledge of history. This lays them open to the designs of demagogues and agitators who strive to make them break with the past and seek the remedies for existing evils or the means of future progress in drastic changes that have not the sanction of experience. It is by a knowledge of history only that such experience can be supplied. It is true that the history of laws, customs and institutions cannot be displayed in museums. You cannot place the successive links of development side by side in such a manner as to appeal to the eye, but the material arts are capable of such an arrangement, and the knowledge acquired in the one branch will be to some extent available in the other. The law that nature makes no jumps can be taught by the history of mechanical contrivances in such a way as at least to make men cautious how they listen to scatter-brained revolutionary suggestions. The knowledge of the facts of evolution and of the processes of gradual development is the one great knowledge that we have to inculcate, whether in natural history or in the arts and institutions of mankind, and this knowledge can be taught by museums, provided they are arranged in such a manner that those who run may read. The working-classes have but little time for study; their leisure hours are, and always must be, comparatively brief. Time and clearness are elements of the very first importance in the matter under consideration. The more intelligent portion of the working classes, though they have but little book learning, are extremely quick in appreciating all mechanical matters, more so even than highly educated men, because they are trained up to them, and this is another reason why the importance of the object-lessons that museums are capable of teaching should be well considered.

For an educational museum originals are not necessary. Casts, reproductions and models are preferable; the proper specimens can be more easily selected; they are infinitely less costly. Such collections are not dependent on the chance of obtaining what is wanted from original explorers. Museums of casts do not compete with the research museums, in which the originals should be stored. Models occupy less room than originals, and can be more easily arranged to exhibit sequence within a limited space.

In an educational museum specimens should be selected that are useful in displaying sequence. These should be arranged so as to show how one form has led to another. When there is actual evidence of the dates of the objects, of course the arrangement must be for the most part in the order of dates. But when, as in the case of most prehistoric objects and many of the arts of savage nations, the dates cannot be given, then recourse must be had to the sequence of type, and that is what I term "typology." It is not an accepted term, and I am not aware that it has been applied before to the study of sequence of the types of the arts. But it appears to me that a name is wanted for this branch of investigation, which the term "typology" supplies.

If it were taken to imply the study of fixed types as characteristic of particular phases of the arts, it would be erroneous. It includes the growths, varieties and developments of the several types. It supplies the want of dates by showing how certain forms must have preceded or followed others in the order of their development, or in the sequence of their adoption. It may be said, as a rule, that simple forms have preceded complex ones. Within certain limits this must be true, but it is not always the case, for in many instances progress consists in eliminating superfluous complexity and reducing the expenditure of time and labour. We have in this, as in all mundane affairs, to deal with degeneracy and decay as well as progressive growth: the two have gone on side by side. It is the work of typology to unravel the true thread of events, and place the objects in their proper sequence for the use of students. Typology forms a tree of progress, and distinguishes the leading shoots from the minor branches. The problems of the naturalist and those of the typologist are analogous. The difficulties are the same in both. In some cases the number of missing links makes it impossible to determine the true succession of forms. In such cases recourse must be had to survivals, as in the case of the majority of savage weapons or forms of art, in which the successive links, being made of wood or perishable materials, have decayed. But a theoretical and fairly accurate development may nearly always be traced amongst the arts of savages by objects in present use. When a simple form is suited to its environment, or when its use fulfils common purposes that cannot be better served by its successors, or when economy of labour is a desideratum, the simple form survives; as, for example, in the case of the common door-bolt, which is the father of all kinds of complex door-locks, and which is still used upon the same doors as the contrivances that have sprung from it; or in the case of the common hand-made pots that are still baked in an ordinary turf fire in the Hebrides, at the same time as the most skilled productions of our modern potteries. So in natural history, invertebrate and vertebrate animals and mammalia are all found living side by side in the same localities, although we know that they represent successive stages in the development of species. Typological sequence or typological continuity may be said to be established when the true succession of forms have been brought out. This is the object of an educational museum. Not only must the objects be specially selected and arranged for the purpose, but the building must be adapted to the proper display of them. Architectural features, handsome halls and corridors are impediments; at any rate, they are points of secondary importance. In my address to the Anthropological Section of the British Association at Bath in 1888, I suggested a rotunda as the best form for a national educational museum of arts, a plan of which was exhibited. The concentric circles of a circular building adapt themselves, by their size and position, for the exhibition of the expanding varieties of an evolutionary arrangement. In the innermost circle I would place the implements and other relics of the palæolithic period, leaving a spot in the actual centre for the relics of tertiary man, when he is discovered. The simple forms of the palæolithic period would require no larger space than the

* A paper by Lieut.-General Pitt-Rivers, D.C.L., F.R.S., F.S.A., read at the meeting of the Society of Arts on December 16.

smallest circle would be capable of affording. Next in order would come the neolithic age, the increased varieties of which would fill a larger circle. In the bronze age a still larger circle would be required. In the early iron age, the increased number of forms would require an increased area; Mediæval antiquities would follow, and so on, until the outer circle of all would contain specimens of such modern arts as could be placed in continuity with those of antiquity. Separate angles of the circle might be appropriated to geographical areas, and where civilisations in the same stage of development are allied to one another, they might occupy adjacent angles within the same concentric ring. Models would be largely used to explain the *gisement* of the relics exhibited. The sections and subsections would be divided under the head of arts, such as pottery, glass, enamels, architecture, house furniture, modes of navigation, land transport, house furniture, tools, weapons, weaving apparatus and textiles, metallurgy, painting, writing, music, mensuration, sculpture, ornamentation, personal ornament, agriculture, hunting and fishing apparatus, trapping, machinery, fortification, modes of burial, modes of punishment, monuments, coins, religious emblems, toys, heating and lighting, food, clothing, basket-making, narcotics, medicine, domestication of animals, and so forth. A manufactory of reproductions, casts and models would be attached to the institution, in the same manner as that established in connection with the museum at Mayence, under the direction of Professor Lindenschmit. The museum would be divided into departments, under the control of separate keepers. By such an arrangement the most uninstructed student would have no occasion to ask the history of any object he might be studying; he would simply have to observe its distance from the centre of the building, and to trace like forms continuously to their origin. Where breaks in the continuity of any art must necessarily occur, references might be posted to show the position of the concentric rings and cases, in which the threads of connection might be taken up again and followed. Such a museum would require constant rearrangement, as knowledge increased, and the cases might perhaps be put on wheels to facilitate their readjustment. An iron building with a glass roof would be the best for the purpose, and the less ornamentation it had about it to divert the eye from the main object of the establishment the better. Existing buildings, such as the Olympia, might perhaps be made use of as a commencement, as it would not be necessary the building should be round, provided the arrangement was concentric. But the Olympia would not be half large enough.

I have been much interested to learn, since my address was delivered to the Anthropological Section at Bath, that Professor Flower, who has already done so much in his Natural History Department since it was transferred to South Kensington to arrange the collections on an evolutionary plan, has independently thought out the idea of a large rotunda for exhibiting the development of species and varieties. A letter which I have received from him gives a rough sketch of the kind of museum that he would propose for the purpose, the present building being, in his opinion, quite unsuited for scientific arrangement. I have little doubt, therefore, that eventually this idea of concentric arrangement will be carried out, and that we shall have somewhere in the metropolis two large rotundas—one for natural history and the other for the arts of life. Professor Flower embodied his views on the arrangement of a natural history museum in his address to the British Association at Newcastle in 1889, in which he expounded very much the same principles for a natural history museum that I had advocated for an arts museum at the meeting of the previous year at Bath. That views so similar should have suggested themselves independently to workers in two separate departments, affords satisfactory evidence that they are in harmony with the requirements of the age.

In order to explain more clearly what my method of arrangement is, I have had prepared a number of large diagrams to show the continuity of several of the series exhibited in the Pitt-Rivers collection at Oxford. Some of these diagrams are very old, and formed part of lectures delivered at the United Service Institution in 1858-69, the Royal Institution in 1875, and elsewhere. Others are of more recent date and are taken from my provincial museum in Dorsetshire. Most of the diagrams were used in a lecture on my collection that was delivered lately at Oxford, at Salisbury and other places.

Having now laid before the meeting my views upon the evolution of types, I desire to make a few remarks on the evolution of my own collection now presented to the University of Oxford.

My attention was first drawn to this subject nearly forty years ago, when, in the year 1852, I was engaged as a subaltern officer on the sub-committee of small arms at Woolwich in the experiments which led to the introduction of the rifle-musket into the army. A large number of inventions were submitted to the committee for trial, and I was then led to take notice of the very slight changes of system that were embodied in the different inventions, and also of the fact that many improvements which, not being of a nature to be adopted, fell out of use and were heard of no more, nevertheless served as suggestions for further improvements which were adopted; and it occurred to me what an interesting thing it would be to have a museum in which all these successive stages of improvement might be placed in the order of their occurrence. I made a collection of arms at that time, which was the foundation of the present museum. Although this collection of arms was not a very good one, as my means of collecting were small, it led to a museum of savage weapons, and ultimately of various other arts, which were exhibited at Bethnal Green and South Kensington for nine years. Mr. Herbert Spencer, in his "Principles of Sociology," published in 1876, thus speaks of it as he saw it at that time:—"The collection of implements and weapons arranged by Colonel Lane Fox,* to show their relationship to common originals of the simplest types, suggests that primitive men are not to be credited with such inventiveness as even their simple appliances appear to indicate. These have arisen by small modifications, and the selection of such modifications has led unobtrusively to various kinds of appliances without any distinct devising of them." The portion of the museum relating to arms was described in an illustrated catalogue *raisonné*, which was in fact a treatise on the development of arms; this went through two editions at South Kensington, commencing in 1877. The collection afterwards grew to such size that I was anxious to see it housed in some public building, where it would be developed in other hands on the same lines, and I ultimately presented it to the University of Oxford. In doing this I made only one proviso of any consequence, which is contained in the deed of gift, viz. "that the general mode of arrangement should be maintained, and that no changes should be made in the details hereafter, except such as should be necessitated by the advance of knowledge, and should not affect the general principles originated by me." This took place in 1884. During the seven years that have elapsed since, the museum has been rearranged in the order in which it was exhibited at South Kensington, so that, in the main, the order of the several series is exactly the same. Some new links have been added to the old series, and some new series have been introduced. This has been done in the first place by Professor Moseley, whose death has been so great a loss to science, and afterwards by Dr. Tylor and Mr. H. Balfour, and has been carried out to my entire satisfaction in every respect, except perhaps the great length of time that it has taken to rearrange, which, I am informed, was unavoidable, as a building had to be erected for it, for which the University very liberally voted 10,000*l.*

But these are not times in which anything can afford to remain buried seven years, and I have had some difficulty in persuading people, now that the collection is resuscitated, that it is the same Lazarus that was alive before. In the meantime, however, I have formed another museum, which, although it is a provincial one, is in some respects better than the first, because such series as it contains are more fully represented. The subject of provincial museums has been lately much discussed in the newspapers. I have often observed that a little knowledge of the subject is necessary to create an interest. I have often noticed that visitors to our larger museums will wander listlessly through the rooms until they come upon something they understand a little about. Then they open their eyes and prick up their ears. It is interesting to them to compare the products of other countries and people in those particular branches of industry that they are familiar with. A local museum should therefore contain a good historical series of the prevailing manufactures or industry of the locality. Acting on this principle, it appeared to me that in a rural district, sparsely inhabited, with scattered agricultural villages and ten miles from every town and railway station, the chief feature of the collection should be agriculture and peasant handicraft.† I cannot convey my views on provincial museums better than by describing my own museum, because it has been collected from the first on a definite system, and has undoubtedly been a great success.

No. 1 room, 20 feet by 13 feet, contains pottery, costumes, personal ornament now in use by peasants in Germany, France, Spain and other nations. Some of these are of archaic design and are probably survivals. The second room, 19 feet by 14 feet, contains carvings by Brittany peasants, chiefly of the seventeenth century, French pottery in present use and village implements of various kinds. The third room, 18 feet by 13 feet, is devoted to a series of tools, household utensils, cooking appliances, &c., of different periods. The fourth room, 24 feet by 14 feet, has an additional series of country tools, and here commences a general series, illustrating the history of pottery, which is continued in rooms 5 and 6, and includes a sufficient number of specimens of each division to represent their kind, viz.:—Ancient British, Silesian bronze age, Etruscan,

* In 1880 I changed my name to Pitt-Rivers, in accordance with the will of the second Lord Rivers.

† The population of Farnham and the neighbouring parishes is:—Farnham, 301; Handley, 868; Tollard Royal, 247.

Egyptian, Swiss Lakes, Cyprian, Greek, Roman, Saxon, Norman, Mediæval, English toft ware, English salt-glaze, Staffordshire and other Old English wares, Scotch pottery, German, French, Swiss, Spanish, Italian, Persian, Anatolian, Japanese, Chinese, Moorish, Peruvian, Mexican. Then follows similar specimens of glass and enamels from different countries. Another general series not yet arranged will be devoted to sculpture and modelling. In the fifth and sixth rooms are models of excavations made by me in the locality, the relics from which are arranged in the adjoining cases. These are available for archæologists who may visit the district to see what it contains of local interest. Other models of ancient monuments, ninety-five in all, have been made under my supervision by my archæological staff, three to four in number, who are constantly engaged upon the work. These models certainly form the chief feature of the museum, and they are unique. The sixth room, 62 feet by 19½, contains also a general series of implements of the palæolithic, neolithic and bronze periods, iron age, Roman, Egyptian and Mediæval periods. The seventh room, 81 feet by 24, is only in process of building. The eighth room, 85 feet by 18, is devoted to agricultural implements and appliances, and contains spades and agricultural tools of all kinds, showing the survival of the Roman wooden iron-edged spade in several parts of Europe; querns and grain-rubbers, some of which are in present use; a Norse mill, showing the earliest application of water-power to the quern; grinding and winnowing machines; some models of crofters' cottages; a series of models showing the varieties of ploughs in present use in different countries; country carts, explained in the same manner by means of models; a series showing the development of locks and keys; a series of crates carried by country women of different countries on the shoulder, and collected expressly to show the women of my district how little they resemble the beasts of burden they might have been if they had been bred elsewhere. All these things are well ticketed, but an explanatory catalogue has yet to follow.

THE TOTNES TOWN HALL.

ANOTHER letter on the Totnes Town Hall from Sir J. C. Robinson has appeared. He says :—

The Totnes Grammar School has undoubtedly been altered at various times, but it still retains many of its original and most interesting features. The very fact of these alterations, made from century to century, has indeed added to rather than detracted from the interest of the structure. Together with the Guildhall, which it adjoins, it forms a group of ancient buildings of infinite picturesqueness and old-world charm. The quaint old doorway, mullioned windows, with their diamond-paned casements, and a curious bell-turret on the roof are still intact. Mr. Windeatt informs us that the building is now to be "remodelled," but that a portion of an old wall in a cellar is to be retained. This is a small mercy to be thankful for. Further than that Mr. Windeatt does not seem to know precisely what the county council intend to do. I am afraid, from the information given me in Totnes, that the intention is to entirely do away with the ancient features I have alluded to, in short, to substantially "remodel" an ancient building into a new one of entirely different design, and which would be quite out of character with its surroundings. As to the suitability of the site for a police-station, it is difficult to see how a building standing quite away from a thoroughfare, and which cannot be approached within 100 yards by any wheeled vehicle, can be suitable for such a purpose. Its entire unsuitableness was, in fact, pointed out to me during my short stay in Totnes by a leading inhabitant of the place. I may state that the matter was brought before the Society of Antiquaries at their meeting on Thursday week. The meeting was a very full one, and several of the members present were acquainted with the locality. Very strong feeling was expressed as to the course proposed to be taken, and it was resolved that a letter in the name of the society should be written to the Mayor of Totnes calling his worship's attention to the subject, and requesting his good offices in respect to it. This was accordingly done.

SOMERSET HOUSE.

THE following letter has been sent to the Secretaries of the Institute of Architects by the Secretary of the Office of Works :—

Her Majesty's Office of Works, 12 Whitehall Place, S.W.: December 16, 1891.
King's College Buildings.

Gentlemen,—In my letter of November 12 I informed you that the First Commissioner was in communication with the Council of King's College on the subject of the addition to the college buildings recently erected at the eastern end of Somerset House.

Mr. Plunket is aware of the great interest which the Royal Institute of British Architects has taken in this matter, and he therefore desires me to let you know what has passed, and the position in which it now stands. When it was found that building operations were being carried on, directed to the addition to the college of a structure which must seriously affect the river frontage of Somerset House, the First Commissioner deemed it his duty to communicate with the Council on the subject. Accordingly, on the 2nd ult., after some preliminary investigations, he caused a letter to be addressed to them, in which he claimed (as he believed he was entitled to claim) that under the deed of grant by which, in 1829, the land was made over to the Council the assent of the Crown was necessary before additions could be made to the buildings of the college.

To this claim the Council demurred, and the point was then referred by him to the law officers of the Crown. They have now given it as their opinion that the Council are within their right in erecting the structure in question, and that unless it interferes with the light and air of Somerset House the First Commissioner has no controlling authority. It cannot be said that the new structure does so interfere, and while the First Commissioner entirely concurs with your society in considering that it impairs to a lamentable degree the architectural effect of the river façade, he is compelled to conclude, though with great regret, that it is not in his power to pursue the subject further.—I am, Gentlemen, your obedient servant,

H. W. PRIMROSE.

The Hon. Secretary and Secretary to the Royal Institute of British Architects.

TESSERÆ.

Idealism and Realism in Art.

IDEAL beauty does not mean, as some seem strangely to suppose, an original or newly-imagined or invented type, the brilliant and original offspring of the gifted artist's mind and "evolved out of his inner consciousness." Human intelligence can only give form or expression to that of which it has, or has had, perception. It can originate nothing of the kind. Its power is not creative, but is limited in art to combination and the adaptation of existing elements. The result of a wholly ideal or imagined beauty, distinct from anything known in nature, could such be conceived, would be a monster of some kind, whereas the test of ideal beauty is the truthfulness of its resemblance to nature. Ideal beauty in imitative art simply means the highest idea or conception the human intelligence can form of natural perfection in distinction to the appearance nature offers in her ordinary aspect, where her normal excellence may have been impaired by accidental disturbance. The realistic school, as opposed to the ideal, aims at exhibiting objects precisely as they are exhibited ordinarily, that is, without selection and without improvement. In the lowest form of this school, and it has its degrees, no imperfections are allowed to interfere with the truth of the imitation. It is enough if the object be found in nature, and ugliness, coarseness, even decay and disease, are for this reason considered worthy of careful representation. The naturalistic and realistic schools have their source in the reaction from the tame, uncongenial repetitions of the classical antique that so long oppressed art. The principle of admitting subjects of present interest as fitting objects for its exercise merits, therefore, full acknowledgment; but it has its dangers in practice. How far its application or exercise may be safe or permissible in the art of painting, which has so many and diverse means of attraction in colour, chiaroscuro, perspective, atmosphere and the power to represent unlimited space, it may be difficult to say; but in an art like sculpture that has none of these accessories to depend upon, and whose most sure and approved instruments are simplicity, breadth of treatment, refinement and beauty of form, it may safely be asserted that such freedom, unless most judiciously exercised and controlled, is utterly incompatible with the conditions on which it can exist, if it is to aspire to rank, even *longo intervallo*, with the noble achievements of the great masters of sculpture.

Durability of Stone.

The physical properties which contribute to durability of stone are hardness, toughness, homogeneity, contiguity of the grains, and the structure, whether crystalline or amorphous. Although hardness (resistance to crushing) is often regarded as the most important element, yet resistance to weathering does not necessarily depend upon hardness and the non-absorbent properties of the stone. A hard material of close and firm texture is, however, in those qualities at least, especially fitted to resist friction, as in pavements and road metal and the wear of raindrops, dripping rainwater, the blows of the waves, &c. Porosity is an objectionable element. An excessive porosity increases the layer of decomposition which is caused by the acids of the atmosphere and of the rain, and also deepens the

penetration of frost and promotes its work of disintegration. If the constituents of a rock differ greatly in hardness, texture solubility, porosity, &c., the weathering is unequal, the surface is roughened, and the sensibility of the stone to the action of frost is increased. The principle which obtains in applying an artificial cement, such as glue, in the thinnest film in order to secure the greatest binding force finds its analogy in the building-stones. The thinner the films of the natural cement and the closer the grains of the predominant minerals, the stronger and more durable the stone. Of course the further separation produced by fissure, looseness of lamination, empty cavities and geodes and excess of mica tends to deteriorate still further a weak building-stone. Experience has generally shown that a crystalline structure resists atmospheric attack better than an amorphous one. The same fact is generally true with the sedimentary rocks also, a crystalline limestone or good marble resisting erosion better than earthy limestone. A stone that is compactly and finely granular will exfoliate more easily by freezing and thawing than one that is coarse-grained. A stone that is laminar in structure absorbs moisture unequally, and will be seriously affected by unequal expansion and contraction, especially by freezing and thawing. Such a stone will gradually separate into sheets. A stone that has a granular texture, as contrasted with one that is crystalline or fibrous, will crumble sooner by frost and by chemical agents, because of the easy dislodgment of the individual grains. The condition of the surface, whether rough or polished, influences the durability, the smoother surface being the better. The stone is more durable if the exposed surface is vertical than if inclined. The lamination of the stone should be horizontal.

Pictorial Effect in Painted Glass.

Pictorial effect is a quality common to sculpture, picture and glass, though different in each. In the two first it is always regulated by the space it occupies. No figure-painter, no sculptor of alto or basso-relievo, would so treat a subject, extending over a series of distinct spaces, as to ignore the forms of the architectural construction which bounded them. Each group would be complete; their connection would be made by the interest of their story. The metopes of the Parthenon, to a certain degree, illustrate this. It is much to be regretted that glass-painters are impatient of this law, which binds all other arts. They also violate the very nature of their own materials in the attempted pictorial effects of atmospheric perspective. These are properly attained only by modulation of colour and loss of outline. Neither of these are properly producible, for modulation is impossible where every piece of glass is of a different tint; and loss of outline is impossible where every piece is held in its place by a black frame of lead. It is answered that these effects are possible, and easily produced by painting in coloured enamels. Let the answer hold good; but we come then to the question of other limits—limits of the right and wrong of human labour, and limits of the duty to human sight. Excessive "finish" is not a necessary quality of high art; the highest art is that in which the greatest conception is the best expressed. The too high-wrought picture in glass condemns itself by the prodigality of human labour on a material so fragile that the least injury would mar it, and if the artist were dead or distant it would be irreparable. It condemns itself also by offering such work as no eye can rest upon to analyse without pain and fatigue. The fault of ambition lies in the pretension of an unjustifiable independence. If the glass-painter be impatient of all limits, whether of architecture or of the special qualities of his own materials—limits, too, of the pleasure, power or endurance of human sight and the use or abuse of his own labour—let him throw up his art and take to canvas. Then he may labour without stint and satiate the eye without fatigue; but if he is to be a glass-painter, let him honour his own art, and neither borrow the specialties nor wander into the province of another.

Completeness in Italian Architecture.

The mistake of building the front of a palace in stone, and suddenly dropping off, the instant the corner is turned, into brick, might occur to even a millionaire in this economical age, but would scarcely have presented itself to a Medici or a Farnese in the old days of Italian magnificence. Not that the wealth or the inclination to do what is handsome might be less in the one case than in the other, but that public opinion and system would keep the patrons of old straight, and allow those of to-day to fall into what cannot but be regarded as an architectural meanness. It would be, of course, too hard to point to any particular cases where hundreds are almost daily guilty of committing similar solecisms in taste, but unless we are to look for the exemplification of nobility of structure to those whose means place it within their power, how can we expect it from those to whom an increased expenditure might be a really important consideration? Nobility of material lavishly used, ample space, solidity of structure, and the gift to the eye of something obviously designed rather to please than to pay, together with the effect that such departures from rigid utilitarianism produce instinctively on the spectator—sources of effect lavishly indulged in in Italy at every period of her history—are only beginning to be appreciated amongst us in the present day. At the times when architects such as Inigo Jones, Wren, Gibbs and Chambers endeavoured to maintain in this country the principles of grand Italian architecture, founded upon the universal practice during the best Classical and Mediæval periods, marble, oak and stone were freely used. Cortiles and loggias, colonnades and arcades, were not banished as profligate waste of ground and money. Carving and the elaborate working out of ornamental features in true and just proportions were considered to be essential to fine effects. Paintings were not to be hung by accident against walls, here a *Madonna* and there a set of boors drinking, but allotted places were provided for them in the vaults and on the walls of the principal apartments. Sculpture, too, found its niches, and when English talent failed to supply it the services of foreigners, in despite of strong insular prejudices, were freely enlisted. And it was precisely when the public taste adopted a meaner class of building materials, a grudging spirit in the distribution of space, and a lower kind of internal decoration, that the arts of design in this country, with some few honourable exceptions, fell to zero. From that pitch of degradation and disintegration they are now happily rising into a concrete and perfect form, with a reaction the vigour of which is scarcely to be paralleled in the world's history. We are beginning to do better in each separate department of production, we are beginning to recognise that excellence in one must necessarily be combined with excellence in others, and we are beginning, in fact, to learn and practice the very system still lingering in the hearts and habits of the Italians.

The Decline of Italian Architecture.

The pernicious influence exercised by Bernini and Borromini, whose trivialities obtained excessive vogue during the greater part of the seventeenth century, tended to the production of that *rococo* style which caused a great deterioration in the florid ornament of the Roman, Venetian and Northern Italian schools. But, extravagant as Bernini was, it would be unjust to deny that he frequently redeemed his excesses, as in the colonnade of St. Peter's, and in the church of St. Agnese, in the Piazza Navona at Rome, by great facility of design and a certain not unnoble bravura of style. Borromini's great follower, Guarini, out-Heroded Herod, and demonstrated by an *argumentum ad absurdum* the ridiculous consequences of adopting the whimsicalities of Borromini. The brilliant talents of Vanvitelli, and the majestic scale upon which he worked out the immense palace at Caserta tended to maintain the dignity of his art during the greater part of the eighteenth century, and showed that magnificence and grand conceptions of pictorial effect had not yet deserted Italian architecture. From his death in 1773 architecture and ornament also greatly declined, and although monuments upon a large scale have been frequently erected since that period in Italy, but few of them are worthy, in any quality excepting that of scale, to rank with the purer taste of earlier times. The feeble classicisms of the style of the Empire were generally slavishly reproduced in Italy during the early part of the present century, and until comparatively recent days little of considerable merit has been executed. The works of Piranesi, Albertelli, Cicognara and Canina, and the illustration principally by foreigners (such as Percier and Fontaine, Mazois, Grandjean, Famin and Montigny, Gauthier, Letarouilly, Zahn, Gütensohn and Thürmer, Grüner, Taylor and Cresy, Willis and Hessemer) of their great monuments of art, have led to a return to a purer class of architectural ornament than had been previously in vogue; while the earnest writings of the Count Selvatico, and the translation of Rio's "Poesie Chrétienne," have introduced to the Italian architects those rational principles of design, including the treatment of constructive form and of ornament, originated amongst us by the younger Pugin. The great scale of the existing edifices, and the reparations which it has been necessary to make from time to time to save them from destruction, have constantly maintained Italian artisans in the practice of rivalling the ancient work, so that in every department of building hands at least abound perfectly capable of carrying out the most difficult designs.

Restoration of Walls.

For protection against the admission of wet from the top of the walls, much can be done by coating them roughly on the parts invisible from below with a concrete of cement and fine gravel, by resetting loose stones in cement, by filling in with the same material cavities and open joints, cracks, &c., always taking care, as far as possible, to do this in a manner little, if at all, visible from below. In extreme cases, where arches threaten ruin, it may be desirable to go the length of erecting centres below and rectifying them and filling in the joints with cement. When any large mass of a wall threatens to fall, shores should be applied, the foundations examined and strengthened, if necessary, loose stones keyed in, open joints filled and, in very

bad cases, bonded; but this should be done under the eye of a person who has a feeling for the work, both on its own account and as a picturesque object, so as to avoid any unsightly tampering with the old work. The only cases where such is necessary seem those in which the shattered piers or walls are insufficient for the weight they have to bear. In such cases they must be underbuilt, buttressed or propped in the same way. Here it will be best to make the new work rough and of old materials, but in no degree to mask it, but rather to make it manifest that it is only added to sustain the original structure. It is clear that in such cases it will be best to call in an architect, provided he is one who has an earnest care for the conservation of the work and a full appreciation of the value of its authenticity. The importance of applying to the finer details a preservative and indurating solution, if such is to be found, is almost as great as that of the upholding of the masses; the pulverisation of the surface seems in many cases to be going on at a constantly accelerating pace and threatens the speedy loss of the true forms of the mouldings and the sculpture.

Utility and Art.

That theory which would base architectural beauty upon utility and fitness is so far from being satisfactory as clearly tracing the source of the former quality to the two latter, that, instead of removing perplexity, it rather increases it. In direct opposition to such doctrine everyday experience convinces us that so very far from constituting æsthetic beauty, mere utility and fitness contribute very little at all towards it, even in architecture, where, as far as the purpose of building is concerned, they might seem to be not only indispensable but all-sufficient, and afford all the pleasure which the mind can derive from examining and contemplating edifices of any kind. Yet such is assuredly not the case; on the contrary, it is only when it aims at something more than utility, when it indulges in the superfluous or the useless—in short, when it steps into the province of art and aims at the idle gratification of the eye, that architecture is entitled to the high distinction claimed for it and the lofty pretensions set up in its behalf. Upon the utility principle of beauty a turnip-field would be a far more agreeable prospect than any to be met with in Swiss or Italian scenery; and upon the common-sense fitness and utility principle, a church erected according to the Islington or Bethnal Green taste ought to delight quite as much as, if not more than, any of those glorious examples of our ancient ecclesiastical architecture which so wonderfully impress the mind. Unless the word "utility" be exceedingly elastic indeed, and its meaning so ductile that it may be drawn out like gold to a most prodigious extent, utility cannot at all be said to recommend the dome of St. Paul's, it adding nothing whatever to the serviceableness of the building; while, on the other hand, the unsightly platforms or galleries with which churches used to be encumbered ought to be accounted beautiful, since they certainly had the plea of being useful as far as affording sittings goes.

Roman Sepulchres.

Bergier, in his "Histoire des Grands Chemins de l'Empire Romain," in citing the well-known law of the twelve tables, "Hominem in urbe ne sepelito neve urito," seems to hint that the injunction was confined to the city of Rome until the time of Hadrian, who extended it to every city in the Roman Empire, "ne sanctum municipiorum jus polluatur," for that superstition of the Greeks had descended to the Romans, that the town was defiled and polluted in which dead bodies should remain. The Greeks themselves had perhaps borrowed the notion from the Egyptians, whose cities for their dead are, to this day, evidence of the population and importance of those which once existed for the living. The sepulchres for the dead in the Roman times were arranged by the side of the highways, to keep them in the memory of the survivors; and this purpose is neatly and distinctly declared in the inscription on an ancient tomb, erected to one Lollius, and cited by Bergier, which declares that he was buried by the wayside, in order that passengers might salute him with their valedictions, as they passed onward on the road: "T. Lollius, T. Lollii masculus, &c. Hic *propter viam* positus, ut dicant prætereuntes—*Lolli, Vale!*"

Individual Standards of Taste.

It is sometimes asserted that that which pleases is beautiful to the person pleased, and that every one has the right to exercise his own fancy in determining what is or what is not beautiful. This is a fallacy. The abstract right to derive pleasure or gratification from any object, or it may be work of art, may be conceded; but no amount of satisfaction it may possibly afford can endow a work with beauty if it has it not. Nor is every one capable of judging off-hand whether or not this quality is present. In art it is not, as many suppose, merely a question of individual feeling. Certain qualifications are required to form a sound judgment on so subtle a problem. This is especially the case in estimating what constitutes beauty in the human figure, so full of variety in all the conditions of sex, age, strength and character. There must be, in the first place, some knowledge of the construction of the figure and of the laws of action; the power to discriminate between various classes of form; and by practice and careful education of the eye, to know how to compare art with nature in her best aspects, in living models, and thus to determine what it is that artists and poets mean by ideal beauty. It is scarcely saying too much to assert that sculpture, especially in its highest forms, can never be popular in the ordinary sense. To be able to appreciate it, and to judge of its merit as a phase of fine art, a people must have some preparation or education, or they must be so accustomed to see good works, which, indeed, is a form of education, as to be capable of perceiving at a glance what claim it has to notice. In England there is little or no opportunity of acquiring this qualification. Education in the principles of art and in æsthetics is not recognised in our schools or university system. The consequence is most injurious to real and true art, in so much that the field is left open to the very worst and lowest influences, and no surprise can be felt that, under such circumstances, incompetent judges and committees patronise unworthy practitioners, and thus have the dangerous power to place before an ignorant public works that can have but one result, namely, to vitiate the public taste and to depress the standard to the level of inferior productions.

Church Spires.

The origin of the spire, like that of the pointed arch, is merely matter of conjecture. The probability is that it arose out of the peaked roof usually given to campaniles and towers of a preceding period, which form was afterwards gradually improved upon and refined, till it eventually grew up into the slender tapering spire. According to such supposition, we would refer to the tower of Thaon church in Normandy as an example exhibiting the rudiments of the spire, it being no more than a steep peaked roof or low pyramid, whose height does not exceed three-fourths of its base. A peak of this kind differs also from the spire, both in being the same in plan as the tower on which it is placed, and in being immediately set upon it, whereas the spire is almost invariably an octagon or other polygon, and is surrounded at its base with a parapet. In Italy, where campaniles are usually detached square towers of very slender or lofty proportions, the spire is almost unknown, for such towers have seldom more than a mere pyramidal roof or peak, which, though it may be considered as the germ from which the Gothic spire was afterwards developed, is in itself of quite different character; yet, at the same time, that of each is best adapted to the respective style. There are some few instances of square spires, among them a very singular one at Egeln in Germany, where two such spires are set immediately together upon the same tower. But however slender in their proportions such spires may otherwise be, they have a certain heavy massiveness of form. When, therefore, greater loftiness and lightness were aimed at in this feature, the adoption of a polygonal plan for it became almost matter of course, for although in a geometrical drawing the general outline and proportions of a spire are the same whether it be square or octangular in plan, the perspective or actual appearance is widely different, because in the latter case the diagonal breadth of the square tower below is cut off, and each side or plane of which the spire is composed becomes a much more pointed triangle. Besides which, the polygonal spire produces a degree of contrast and variety highly favourable to general effect in the Pointed style.

Pâte sur Pâte.

The name of *pâte sur pâte* explains sufficiently the process which consists in staining the body of the hard porcelain in celadon or other colour by the addition of a coloured mixture, of which oxide of chrome is generally the chief ingredient, and then, when the piece is still in the clay state, to paint or rather model upon it with a brush, using the white body of the porcelain as the pigment, and taking advantage of the transparency it will acquire when fired to produce an effect similar to that obtained in the Limoges enamels by working the semi-transparent enamel on a black ground. Consequently the artist will increase the thickness of the white clay for the high lights, and decrease it where the colour of the ground is to be seen through. Much experience is required to calculate the effect, the white clay before firing being equally opaque in the thin as in the thick parts. Of course any mistake is irremediable, as it can only be seen after the piece is fired. It was from studying the Chinese celadon that Ebelmen started this kind of porcelain. The colours used, on account of the high degree of temperature, are extremely limited. We have already mentioned that chrome was the foundation colour for all the grounds; to this must be added cobalt, nickel and uranium, which are also used to stain the clays when some other tint is wanted in addition to the white. This scarcity gives a slight monotony to the general effect of the pieces.

NOTES AND COMMENTS.

THE restoration of the church of St. Bartholomew the Great, in Smithfield, is making steady progress under the direction of Mr. ASTON WEBB. Since the south transept was opened in March the triforium arches have been opened up, and the roof over the south triforium has been reconstructed, while that on the north side (which has been occupied till quite recently by the boys' school of the parish) has merely been repaired. The Norman vaulting below both of these triforiums, which has been long destroyed, has now been renewed throughout, thus rendering the building much more secure from fire. The opening of the north triforium gives access to Prior BOLTON'S window, the stone sill of which has been worn to a remarkable extent by feet. It will be interesting to know whether archæologists can now add anything as to the probable use of this window. Access to this triforium is by a spiral stone staircase. The old brick tower—which is, in a measure, picturesque and historically interesting—is to be retained, after being strengthened by iron ties, and the copings reset and repointed throughout in cement. A stone porch will shortly be added. The pre-Reformation peal of five bells have been tuned and rehung and set in ringing order. The north transept is to be taken in hand next, all preliminaries regarding the blacksmith's forge and the charity house occupying the site having been completed. This will expose a considerable amount of old work at present entirely concealed, and probably lead to a more correct knowledge of the plan of this part of the building.

THE guides who lie in wait about the courtyard for visitors to the Louvre will not be grateful for the latest innovation. M. GUILLAUME, the architect who has charge of the buildings, has been instructed to prepare two plans of the galleries on a large scale, which will be placed at the entrance of the Pavillon Denon and at the staircase Henri II. They will be tinted in different colours, and will give indications of the principal contents in legible printing. Plans of the kind have been long needed, for the majority of visitors are unable to realise the number of galleries that can be visited. Hence it is that, while the picture galleries and the sculpture halls are occasionally crowded, the range of galleries which contain the discoveries of Monsieur and Madame DIEULAFOY and much else that has interest are left to the attendants. In fact, it would be well to have smaller plans, which could be placed at points where there is a variation from a direct line of galleries, for the Louvre is not half known.

ACCORDING to Mr. DEACON'S last report the progress of the tunnel under the Mersey, which forms part of the works for the water supply of Liverpool, continues to be satisfactory. Out of 805 feet—the distance from the centre of the Lancashire shaft to the centre of the Cheshire shaft—a length of 352 feet was completed at the end of last week. On the resumption of work on November 12 last, after the Corporation had taken it into their own hands, a rate of about 25 feet a week was attained. The rate has since been increased, and last week a length of 49 feet 6 inches was driven and lined. It is probable that about 50 feet a week will prove to be the maximum speed attainable with the old shield, defective in many respects and patched as it is. This is undoubtedly satisfactory progress, but with a new shield, designed by the light of experience gained in this work, there can be no doubt that a higher speed can be obtained, and that the operations could be carried on with little or no risk. The immunity from serious stoppages since the resumption of the work has been chiefly due to the fact that no important disturbance of the strata surrounding the tunnel has taken place. The materials are still for the most part open gravel, sand and silt, crossing the face of the work in ever-varying thicknesses, and so long as they remain unbroken and the shield is simply called upon to cut through them a circular hole 10 feet 3 inches in diameter, the difficulty and danger of driving are reduced to a minimum. The tunnel is now under the deepest part of the channel, from which it is separated by about 22 feet of open water-bearing strata. The depth of water in the channel at high tide is 22 feet, and the head of water at the lower part of the exposed face is then about 54 feet. It is anticipated that the tunnel will be completed in about nine weeks.

AT this season, when imagination is allowed fair-play, many young people will be reading ancient stories in which benevolent beings that are not of human kind appear as actors. But the wonderful fish that appeared this year in Lough Erne, in the North of Ireland, was as great a wonder-worker as many of them, and served archæologists, who in general are not favourites with the "good people." The representatives of the animal kind in the legends as a rule take care to avoid suffering indignity—for pain is out of the question—but the Ulster fish allowed himself to be hooked. As often happens, he then descended to the bottom of the lake, and it was supposed it was only in the sulks. Then there was motion, and the line became entangled in something that was supposed to be a stump. When the fish rose to the surface the men found, instead of a stump, a very ancient shrine. It was secured by the chairman of the Enniskillen Town Commissioners, but whether for public purposes or for his own cabinet is not stated. It appears that on the shore opposite the point at which the shrine was found are the remains of a stone structure—no doubt an abbey—around which there is an irregular square foss, one side of which runs along the top of the steep bank and bounds the shore of the lake. Tully Castle is quite near, and the stones of the abbey may have been utilised to build it. The shrine is 7 inches by $3\frac{1}{2}$ inches, and in height $5\frac{7}{8}$ inches. It consists of two distinct parts, an inner and an outer shell. The sides and the lower parts of the two ends still remain. There are no signs of ornament about it. The outer shrine has a lining of yew wood in two distinct pieces. The greater part of the exterior is plain and unornamented. Below on both sides there are remains of four bosses of which the circular traces still remain. It is needless to inquire about the fate of the principal agent in the discovery. "Patitur qui vincit" has no partial application.

IT is worth recording that the Municipal Council of Paris have at last recognised in an inexpensive way the marvellous powers of THÉOPHILE GAUTIER, who once was known as "le bohème mérovingien de la rue de Navarin." Although, in the days when he was the model for *Jeune France*, he allowed his locks to fall in curls to his waist, and wore vests of crimson velvet and boots of yellow leather, went hatless through the streets, and was a terror to the *quartier* from his experiments in pyrotechnics, in his province as a writer poor THÉO was unmatched. VICTOR HUGO considered he was the only man, after himself, who could write pure French. Many of the painters and sculptors of Paris owed their reputation to his articles, and, like most critics of art, he found ingratitude from the men he created. GAUTIER'S own ambition was to paint pictures instead of writing about them, and his manner of describing things displayed a faculty for the picturesque which, under a different sort of training, might have made him one of the glories of the French school. But he could not become envious through his own failures, or by seeing the success of many artists, and his fondness for bestowing praise grew with his years. GAUTIER did not covet honours during his life; a modest competence, and a seat in the Academy, were his desires, and neither fell to him. GAUTIER'S reputation rests on books and the traditions of his manner of living. Paris is without a statue of him. It is true there is a bust in the dreariest of the corridors of Versailles, but so many figures of nonentities are ranged in that refuge, few visitors have patience to seek out the features of the author of "Mademoiselle de Maupin," "Capitaine Fracasse," "Caprices et Zigzags," and many other masterpieces in prose and verse. As he once wrote "le buste survit à la cité," perhaps the Parisians consider that GAUTIER should not be commemorated by a work of sculpture, in case their city became a ruin. At any rate, in his case they have adopted the more economical plan of naming a part of one of the suburban highways after him. In Auteuil a section of the Rue du Point du Jour is henceforth to be known as the Rue Théophile Gautier, and so great a distinction ought, it is supposed, to satisfy the shade of the French GOETHE.

CENOTAPH FOR MELBOURNE, AUSTRALIA.

THE bust in statuary marble, which forms an important part of this cenotaph, is Mr. STORY'S work, and was executed in Rome. The frame is in English red alabaster, with red marble columns and panels. The heraldic devices in white alabaster are painted in proper colours and gilded. The carving was done by Mr. LAWRENCE TURNER; the decoration by Mr. H. A. B. SMITH; Mr. E. PRIOLEAU WARREN was the architect. The monument is to be erected on the wall of a church at Melbourne.

HOUSE AT EASTBOURNE.

For description see page 351, December 4.

COTTAGE DISPENSARY, WALTHAM ST. LAWRENCE, BERKS.

THE cottage contains a parlour-kitchen, with scullery and offices, a dispensary and a waiting-room on ground floor, and three bedrooms above. The ground-floor walls are 14 inches thick; those of the first floor half-timbered. The cost was about 540*l.* The work has been carried out by Mr. J. B. SEWARD, of Wokingham, for Mr. W. LANDSDOWNE BEALE, Mr. E. PRIOLEAU WARREN being the architect.

MANSFIELD HOTEL, GOSPEL OAK, N.W.

THIS building has been erected on the site of the old hostelry which was known for many years as the Old Flat Iron, named through the peculiar shape of the site on which it stands, and is situated at the junction of Lismore and Mansfield Roads, Gospel Oak. The whole of the ground-floor is faced with Aberdeen and Dalbeattie red and grey granite, and the upper part is of Boreham red bricks and Coombe Down Bathstone, relieved by pilasters, &c., of Lawrence's Bracknell rubbers. The ceiling of the bars is of enamelled iron supplied by Messrs. SIMPSON & Co. The whole of the internal fittings are executed in Cuba mahogany. The gasfittings and ornamental ironwork and grills, &c., have been carried out by Messrs. WYKEN & Co.; the pewterers' work by Messrs. SANDERS & SONS; the whole of the glazing by Mr. H. CONOLLY; the tiling by Messrs. CARTER, JOHNSON & Co.; the constructional ironwork by Messrs. LINDSAY & Co., and the carving by Mr. GILBERT SEALE. Mr. L. F. LUNDY, of Shepherd's Bush, carried out the building contract from the designs and under the superintendence of Mr. ALBERT E. PRIDMORE, architect, of 2 Broad Street Buildings, E.C., and Watford, Herts.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Edinburgh Architectural Society was held last week. Mr. James Bruce, W.S., moved:—"That this Association, as taking a deep interest in the careful preservation of the ancient buildings of Scotland, particularly of those in and near Edinburgh, has observed with great satisfaction that the Most Honourable the Marquis of Lothian, Secretary for Scotland, has recently been personally present at an examination of the present condition of the Royal Palace of Linlithgow, which has been in a roofless state since the fire of 1746; that the Association feels that the buildings of the palace are presently in a critical state, and expresses a hope that without delay such steps will be taken by Government as will prevent the further internal decay of the palace through exposure to the weather, and remove the immediate risk of the masonry falling, and thereby causing serious destruction to the remainder of the fabric." In submitting his motion, Mr. Bruce spoke of the dilapidated condition of certain parts of the palace, and of the great loss which Scottish historical and architectural art would sustain if means were not taken to preserve the structure. Mr. Thomas Ross, architect, in seconding, stated that the present state of the palace was simply deplorable from a historical and architectural point of view. The motion was unanimously adopted, and it was agreed to forward copies of it to the First Commissioner of Her Majesty's Works, to the Secretary for Scotland, and to the Lord Advocate. Mr. G. Aitken, architect, gave notice of a motion in favour of the removal of the Wellington Statue from its present site, on the grounds chiefly that it was now an obstruction to the thoroughfare, and that it was incongruous with its surroundings. Mr. J. M. Gray, curator of the Scottish National Portrait Gallery, afterwards read a paper on "Sir Henry Raeburn and Portraiture in Scotland." Having, towards the outset, pointed out the historical value of portraiture, Mr. Gray remarked that in Scotland the usual sources of portraiture were sepulchral slabs and brasses, illuminated manuscripts and coins, and sometimes charters. Dealing specifically with painted portraiture, Mr. Gray described as one of the first great examples, splendid as a specimen of religious and art portraiture alike, the altarpiece of Trinity College Church, Edinburgh, now preserved in Holyrood, one of the finest examples of early Flemish art in Britain, and certainly by far the finest in Scotland. Then Mr. Gray treated of the portraiture of Queen Mary's time, taking particular note of portraits of the ill-fated queen herself. There was no doubt, he concluded, as to what Queen Mary was really like, though as most of the artists who portrayed her were comparatively poor painters we did not realise the beauty and loveliness attributed to her, but had, as it were, a map of her features. Mr. Gray next directed attention to some of the leading Scottish portraitists of succeeding centuries, giving particular notice to George Jamesone, William Aikman and Allan Ramsay the younger, until he came to Raeburn, the Scottish portraitist, said the lecturer, in whose best work they found almost at its highest the purely æsthetic value that came from technique, from the masterly use of material, and one in whom they found this purely sensuous charm united to the very utmost value of record. No other Scottish portrait-painter was worthy to stand by his side. The only other Scottish artist fit to be named in the same breath was a genre painter, David Wilkie. On the motion of Dr. Marshall, seconded by Mr. James Orrock, R.I., Mr. Gray was thanked for his paper.

THE SHREWSBURY BATHS COMPETITION.

THE Baths Committee of the Shrewsbury Town Council have reported that having carefully considered the plan to which the first premium was awarded by the Council, they were of opinion that some slight alterations might with advantage be made, and the cost of the baths reduced. Having conferred with the architect, he at once fell in with the views of the committee, and considered the suggestions made would be an improvement in every way, as well as a saving of 500*l.* At the committee's request Mr. Johnson has prepared a set of amended plans, which, while maintaining the features of the accepted design, differ in some minor points, such as the following:—One pay-office is provided instead of two, so as to economise in the cost of management. Second-class bath to be the largest, and arranged so that swimming contests and other entertainments may take place in it. A gallery will be provided, also two additional exits for use on special occasions. The committee are satisfied that it is not advisable to reduce the length of the baths, but think that 30 feet is ample for the width, and it will be noticed that in the amended plan this reduction has been made. The committee unanimously recommend that the plans now submitted be adopted, and the necessary steps taken with the view of proceeding with the work as speedily as possible. It is also recommended that Mr. John Johnson, of 9 Queen Victoria Street, Mansion House, London, the author of the selected design, be engaged as architect, and instructed to prepare the necessary working drawings and specifications for obtaining tenders, and that for this and attending to and being responsible for the erection of the baths, he be paid the usual 5 per cent. commission (to include the premium of 50*l.*), together with the usual travelling expenses. Mr. Johnson undertakes to bear the cost of the alterations in the drawings, and the committee think, under the circumstances, it is only equitable for his travelling expenses to be repaid. The following is Mr. Johnson's report:—

9 Queen Victoria Street, Mansion House,
London, E.C.: December 4, 1891.

Dear Sir,—Having conferred with the Baths Committee, I beg to forward plans amended in accordance with their views, in which I fully agree, the alterations being improvements, besides lessening the cost from 7,000*l.* to 6,500*l.* The simplicity of the general scheme is maintained, and accommodation provided much beyond the original requirements, which I may mention for comparison:—

Required.—First-class swimming-bath, 75 feet by 35 feet, equal to 2,625 feet area; second-class ditto, 60 feet by 30 feet, equal to 1,800 feet; total water area, 4,425 feet. First-class gentlemen's private baths, 3; second-class ditto, 2; first-class ladies' private baths, 4; second-class ditto, 2; total 10.

Provided.—First-class swimming-bath, 75 feet by 30 feet, equal to 2,250 feet area; second-class ditto, 90 feet by 30 feet, equal to 2,700 feet area; total water area, 4,950 feet. First-class gentlemen's private baths, 4; second-class ditto, 5; first-class ladies' private baths, 4; second-class ditto, 5; total, 18.

By having only one pay-office, the cost of management is reduced, and all entrances are under observation. A large entrance-hall is now provided, which will be most useful when swimming and other entertainments are given. The reversal of deep ends of swimming-baths will place the shallow ends next the entrances, and the laundry portion will be available for retiring-rooms when desired. The gallery is arranged to second-class bath, that now being the larger, and two additional exits provided. The first-class swimming-bath when used by ladies can be entered without passing through gentlemen's waiting-room, and altogether the amendments will result in the production of a building admirably suited in every way for the intended purposes.—Yours faithfully,

John Johnson.

The recommendations of the Baths Committee were approved by the Town Council.

FRENCH ARCHITECTURE.*

By Sir Frederick Leighton, P.R.A.

(*Concluded from page* 378.)

I SPOKE just now of the peculiar charm and splendour which is bestowed on the French churches by their stained-glass windows. But another element of dignity was added to them by a wealth of sculpture, on which time will not allow me to dwell. It must suffice to say that while the carver's art in France was during the Gothic age prolific beyond example, it early reached and throughout maintained a high standard of excellence. It was everywhere full of sincerity and freshness, often of great beauty and stateliness, and always in its application marked with a strong sense of fitness and artistic propriety. Sparingly used in the interior of the churches, in which a noble restraint invites to grave and silent contemplation, it spread with unstinted, though well-marshalled, profusion over their external features. The sacred edifice thus challenged the passer-by through its manifold magnificence; and this alluring wealth was most widely spread about the portals through which the faithful were to be drawn.

But even as the stability of a Gothic church rested on a nice poise of mutually counteracting forces, so the maintenance of the style itself at its perfect point depended on a due balance of the intellectual forces which had generated it. This balance was soon to be disturbed. The fascination of the statical *tour de force*, the craving to bring down to an irreducible minimum the amount of material that would suffice to the stability of a building extravagantly lofty, was irresistible. Mathematical calculation played a daily more absorbing part, and resulted in the rearing of such a structure as the choir of Beauvais, which, presuming too much on abstract calculation, was so lacking in solidity that it gave way within a few years of its erection, was rendered relatively stable only by doubling the number of its supports, and is held together to this day only by a network of iron ties—a building which distresses by its stilted and meagre aspect and lifts its vault to such a height that the eye cannot be directed to its summit without considerable physical discomfort. Another, no doubt in its way beautiful, church which exemplifies the training down of constructive forms to the last extreme of attenuation is St. Urbain of Troyes, in which the flying buttresses have the skeleton meagreness of iron girders, and the principle of external props is carried so far that two tiny vaulted porches at the north and south entrances think it necessary to provide themselves with flying buttresses standing out at either angle on the pavement. This building has the further peculiarity that it seems by some fissiparous effort to have split its substance into two layers, as though the outer church had been shed, so to speak, leaving another inner one intact and complete. Again, you will see that by the elimination of all idle portions in a structure of which the active portion is a skeleton, line becomes dominant through the omission of planes; lines were soon needlessly multiplied; narrow ridges first ran up the faces of the shafts, and then, as if convexity of surface was in itself a culpable waste, what had been a shaft was hollowed into furrows divided by an arris; concavity and rigidity invaded everything with an exasperating angularity of effect. Of this you may see an illustration in the cathedral of Auxerre, where the choir retains the fuller forms and those of the nave shrivel into concavity.

But if the causes we have noted led, in structural forms, to a rigid multiplicity of vertical lines, exterior decoration, which rapidly grew in exuberance, gave scope to that love of sinuous serpentine forms, born of a sense of the grace of motion, which has always marked the French, and, whilst vertical constructive lines multiplied themselves in the interior of the churches, an incontinent exuberance of fantastic curves began to spread over their exterior surface, clothing them with an embroidery of wildest decorative fancies. In this development of what became in the end an uncontrolled orgy of the chisel, the first step was a breaking-up of the tracery of the windows and a substitution for geometric forms of a flame-like—flamboyant—arrangement of curves, both picturesque and graceful, but wanting in the dignity and fitness of the earlier device. Meanwhile, into whatever excesses the French carvers were betrayed at this period of Gothic art, the vivacity and spontaneity of their genius ever light up their work and disarm criticism. We feel throughout that, with whatever redundancy and mannerisms, they are expressing themselves sincerely and in their own vernacular. How necessary to all excellence is this cardinal virtue of sincerity will be borne in upon you if from the façade of this cathedral of Troyes you turn to a famous rood-loft in the church of the Madeleine in the same city, the work of one Giovanni Gualdo, an Italian, who, being buried beneath it, declares in his epitaph, not without some boldness, that he will not be found crushed when he is called to judgment. This rood-loft is of extravagantly flamboyant character; but whilst the work of the French carvers at the cathedral is instinct with living grace and power, the genuine expression of something spontaneously conceived, the work of this Italian, which was not a natural utterance, is, like all Italian Gothic detail, intolerably clumsy and coarse, to a degree which would be perplexing, in view of the amazing beauty and subtlety of Italian handling in Renaissance ornament, if we did not remember that the latter was with them a sincere and natural mode of expression.

Gothic architecture, though it continued till late to produce fine work, had lost its perfect balance already before the close of the thirteenth century; it had forfeited also some of that rich personality which marked it before it had become to some extent a matter of recipe in the hands of the Freemasons. Nevertheless, however little scope it found during the disastrous period of the English wars, it held its own with the vitality of an indigenous growth, and, as we shall see, fought long and manfully with the new ideas in the days of the sudden swinging back to Italian influence of which I shall now have to speak.

But before leaving this branch of our subject I will venture to note an instance, as I think it, of the fine tact of the French church-builders, namely, their adoption, which I cannot regard as fortuitous, of the circular east-end, the "chevet." Mr. Fergusson, indeed, sees the source of the French ground-plan in the addition of a nave to an original circular building; this ingenious explanation does not, I think, offer an adequate solution. It seems to me but just to give full credit to the French builders for the higher fitness of any form they adopted. How beautiful a square east-end may be we in this country abundantly know, but it is difficult to divest oneself of the feeling that a church so terminated is a more or less arbitrarily truncated arcade which might be produced indefinitely; in the circular arrangement, on the contrary, not only is the design more visibly closed, but every limb of the encircling bays strives back, and is gathered up into a key suspended immediately above and emphasising the holiest spot, the altar of the sacrifice.

And now we turn to a wholly new phase in French art, the expression of a new order of ideas and of materially altered social conditions. During the fourteenth and fifteenth centuries the prestige of the fighting nobility had suffered much through the introduction of artillery and the reverses of the English wars; the middle classes, on the other hand, had under the favour of the kings steadily risen in importance. Before the end of the fifteenth century the printing press had begun to scatter knowledge far and wide. The discovery of a new continent across the Atlantic was stirring the imagination of the Old World. But it was a discovery within that Old World which was to exercise the deepest influence on the intellectual condition of France, the discovery of Italy, through the expeditions of Charles VIII. and Louis XII., for a discovery it may be called, though it must not be assumed that Italian influence was entirely absent in France until that period. Already in the middle of the fifteenth century René of Anjou, himself a painter and the friend of the leading humanists of his time, had made his court at Tarascon a centre of culture and of art, and employed the labour of Italian artists. Within the first half of the century, too, a great painter, Jehan Fouquet, had brought back from Italy a marked leaning to the new classic spirit. Nevertheless it was not until the return of the romantic stripling Charles VIII. with the flower of the French nobility from his futile and fantastic campaign that the desire for all things Italian took wide and lasting hold of the French—at least, among the nobility—and this enthusiasm, further whetted during the chequered campaigns of his successor, Louis XII., grew at a rapid pace. It was not, however, till the second decade of the sixteenth century that through the example of that brilliant *dilettante*, Francis I., the Italian contagion

* An address delivered to the students of the Royal Academy at the distribution of prizes on the 10th inst.

showed important results. Within the thirty-five years of his reign a host of palatial buildings were raised in a new style, which, if it had not, as had the style it pushed aside, the virtue of indigenous growth, was certainly marked by extreme charm and beauty. It was not, I say, of spontaneous growth, but neither was it a wholly alien product, for the people from whom it was adopted had in past times left on the more vivacious Gallic stock distinct traces of its blood, and the French have not ceased to this day to claim kinship with the Imperial race.

Meanwhile, borrowed though the new style was, the French at once moulded it to their own genius and produced a result distinctly personal to themselves, and the modifications they introduced in the Italian style were just such as you would expect from the different temper of the race. The restrained and sweet gravity which delights us in the purest examples of trans-Alpine Renaissance is, it must be admitted, too often wanting in the French work of the same class, and if, as I believe, the rank of a work of art is according to the dignity of the emotion it stirs in the beholder, then the creations of the great Italians rise to a higher level than those of the artists of the French Renaissance. For vitality and variety, on the other hand, for exuberance of fancy, for resourceful ingenuity of construction and for a delicate sense of rhythm and proportion, the superiority of the work of the French is, in my opinion, conspicuous. Above all things it is their own, and for this reason it seems to me that the jealous investigation which has been noticeable in recent times in France, as to how far Italian artists have been unduly credited with the building of certain of the masterpieces of the Renaissance in that country is, however valuable in the interests of truth, of no great moment to the dignity of French art. Close study of documents has led, as is well shown, for instance, in Palustre's beautiful instalment of a "History of French Renaissance," to the dismissal of claims hitherto advanced in various cases in favour of Italian artists; it is bringing into greater prominence the names of native *maistres massons* whose claims had been underrated, men who had inherited traditions which made them greatly superior, as builders at all events, to the artists who came amongst them from beyond the Alps. But, apart from such inquiries, it is patent that all but every work of the French Early Renaissance, however it may have originated, bears the unmistakable stamp of the fusing energy of French genius. That the style was not born in France is a fact no one can challenge; that it was recast in that country into a distinctly French thing no narrowness could dispute.

The keynote of the Renaissance movement being the assertion of the beauty of life and the dignity of man, its influence was naturally most felt in connection with secular life. The great era of church building was past, and, indeed, for a population reduced by long and wasting wars the existing places of worship were not insufficient. The main determining motive of artistic activity under Francis I. was the ambition of the king and his nobles to multiply places of delight for their residence, especially in the country, and to replace by sights of beauty, such as they had learned to love and covet in Italy, the moated gloom of their ancestral châteaux, built and well-suited for purposes of protection and defence, but little in harmony with the tastes of the pleasure-loving court and the lighthearted young king who led it. Prodigious and breathless was the activity with which châteaux were raised, first in the royal province watered by the Loire, and then in and about Paris. It would be fruitless to enumerate at length even the chief of the stately buildings, which from that time to the death of Henri III. occupied the energies of French architects; nor can I do more here than name a few of the foremost of these considerable men, such as in the first line Jean Bullant and Philibert de l'Orme; and in the second, Colin Biart, Pierre Chambiges, Pierre Nepreu (*alias* Trinqueau), Gadier, Le Prestre and Hector Sohier. It will be more profitable to note a few points in connection with the evolution of the style itself. Although, as I have said, the great outburst of activity in the new direction coincides with the reign of Francis, Italian influence had already begun to assert itself in architecture as in other things in the preceding century, through Charles VIII. at Amboise, for instance, and more effectually under his successor, who built the east wing of the Château de Blois, and whose great Minister, Cardinal d'Amboise, raised near Rouen the magnificent château of Gaillon, known to us now through a few fragments only, and the precious work of Du Cerceau. In these buildings, however, the French and the Latin elements are jumbled into a pasticcio rather than fused into a whole. As an interesting example of this confusion, I will instance the period of the Ducal Palace at Nancy, in which the decorative magnificence of the whole design palliates the maddest marriage of heterogeneous forms ever conceived in an artist's brain.

It is interesting to observe the attitude of a people possessing great building traditions and very definite æsthetic propensities, in the face of an innovation imposed on it, in a manner, from without, but stimulating to its sense of beauty and its appetite for the new. Two influences were adverse to the new fashion—first, the spirit of the men of the burgher class, who clung to a style identified in their minds with their nationality and the growth of their liberties; and secondly, the conservative attitude of the Church, jealous of an art so secular in its inspiration, tenacious, too, of a tradition of building closely bound up with its history and exactly moulded on its needs. We see accordingly on the one hand the municipalities continuing for some time to build their public halls on the old lines, and on the other the clergy erecting Gothic churches well into the sixteenth century, and retaining the structural dispositions of ogival architecture even after the outer forms of the Renaissance had been accepted for sacred buildings. It is, indeed, not a little curious to see so logical a people, while holding firmly to their old methods of construction, consenting to abandon forms which had grown out of those methods, and were, in fact, the emphasised expression of that construction. We see with amazement edifices constructed on the basis of a predominance of the vertical line piled up painfully with tier upon tier of parts taken from a style based on the opposite principle. No talent can redeem so deliberate a violation of every fitness. As might be expected in the first efforts of Renaissance building in France, the Classic orders were used in no very scholarly fashion; they were, however, it must be owned, handled and applied with a delightful sense of the picturesque, and, if severity and simplicity are often wanting, an altogether surprising alertness of idea and fertility of resource are manifest on every hand. In the case of secular buildings the transition from the later Gothic was facilitated by the fact that squareheaded openings prevailed already in that style, of which, too, the incontinence in ornament was acceptable to the exuberant spirit of the new art. The character of that ornament, however, was entirely changed; fantastic, foreign arabesque took the place of the floral decoration which had been one of the glories of the French school. Meanwhile the love for aspiring forms lived on, and the tendency to complexity died hard. The wealth of skyline produced by spires and pinnacles was perpetuated in high-pitched roofs, turrets and tall buttressed dormer windows. The skyline of Chambord could have been conceived only by an architect having Gothic tradition in his blood. In other matters, too, we find the Gothic habit surviving. The external winding staircase, for instance, was long preserved, and you may see on a dainty façade of the time of Francis I. the survival of the grouped shaft in a fanciful colonnette engaged on the face of a pilaster. But most interesting to observe is the tenacious struggle of the vertical line throughout French Renaissance architecture. "The Orders," with their bold entablatures, did, it is true, compel some stress on horizontal lines, though we shall see later how this restraint was in part evaded, but their effect was at once balanced by an emphasised vertical grouping and uniting of the openings in the different storeys, and by projecting wings, towers and pavilions, which marked with perpendicular lines of shadow the elevation of the French buildings.

Of the first period of the style the finest example is undoubtedly the south-west angle of the court of the Louvre, by Pierre Lescot—a great artist, though he may not wholly justify Ronsard's hyperbolic eulogy—a building made doubly stately by the fact that the reliefs which so richly clothe it are due to the hand of Jean Goujon, who, with Germain Pilon, marks the highest level of French plastic art in the sixteenth century. These reliefs display, like those from the same hand on the Fontaine des Innocents, in a marked degree that conspicuously French quality, the sense of the decorative properties of line and form. By this time the knowledge of Classic art was becoming more thorough and the application of its features more correct, and with a more Romanising spirit, if I may so call it, a tendency to larger forms grew up; so, at Ecouen first and later at Chantilly we find Jean Bullant introducing what was called the *ordre colossal*, an order, that is, embracing the whole height of a façade. A greater aspect of strength and stateliness no doubt attached to this new disposition, and the dying out of Gothic traditions of common sense blinded him to its inherent incongruity. But even in adopting this purely Roman device his Gallic blood prompts him irresistibly to a flouting of the horizontal line. He does so with curious thoroughness in the pavilion which bears his name at Chantilly. Not only does he here omit any line hinting even at a division into floors, but of the windows in the upper and lower storeys, which are compacted into groups of vertical designs; the lower plunge downwards through the base which carries the order, and the upper, breaking audaciously through the broad entablature of that order, lifts itself bodily and to nearly half its height into the roof. A most corrupting spectacle, my young friends, I fear, for justice bids me add that the effect is very pleasing. Thus genius, but genius only, redeems what in mediocrity would seem a sin. But Bullant was yet to be outdone, for in the design of the inner court of Charleval, a work begun under Charles IX., but never carried out, and known to us only through Du Cerceau, who speaks of

it with extravagant praise (Lübke suggests that he may have designed it himself), we see not only the same omission of floor-line, but actually niches with statues so introduced that they cut across the exact spot where the floor lies, so that an effort of reflection is required to assure us that a floor can exist there. Philibert de l'Orme, the learned and courtly engineer, architect and writer, was, as far as we can judge from the fragments of his work which survive and the knowledge we have from Du Cerceau of his designs for Anet and the Tuileries, an artist of well-balanced mind and scholarly training, whose conceptions are marked by dignity and refinement, but in whom the stamp of genius is not so evident as in the less cultured Bullant. Anet, with its wide courts, its palatial distribution and its rather frigid triumphal archway must have been impressive and stately; of the design for the Tuileries, on the other hand, I am unable to form a favourable opinion. On either side of a pavilion, not itself, I think, very happy in design, abuts without evident connection a low building in which a crowded attic of unfortunate proportions rests immediately, nothing intervening, upon an arcade, very handsome and dignified in itself, but calculated to carry a palace and not a highly decorated garret. It is as if you should place a hat on a pair of legs and offer the result as a man. To De l'Orme is due the introduction of what is called the *ordre français*—a column of which the fluted drums are divided by ornamented bands.

But the days were near when the light of creative genius in art was to burn low. The days of civil strife and butchery in which so many noble lives were quenched in blood, the dark days of the Huguenot persecution were not auspicious for the growth of art, and with the close of the century we find life and spontaneity at a low ebb—little production, a tendency now to heavy monotony and now to baroque redundancy, and a lack of sense of fitness which admitted of masking with a ponderous Classic façade churches built on the scheme of, if not with the forms of, ogival architecture. Officialism, too, in artistic matters was at hand, and soon that implacable organiser Colbert was to regulate the arts, also by royal decree, and to found an Academy which admitted only one saving creed. The frigid pomp, the artificial graces of the structures inspired by the "Roi Soleil"—majestic in the many-storeyed wig which encircled his retreating brow—how far are they from the radiant daintiness, the joyous freedom of the palaces and pleasances which sprang up in the days and at the beck of that truly sunny sovereign Francis I.?

How architecture fared in the following century, "the Grand Siècle," I have already suggested. The same taint of inflated monotony which prevailed in the works of the builders spread also to painting. Dull already in the hands of Simon Vouet and Sebastien Bourdon, it reaches the height of turgid pomposity with Charles le Brun, a mighty personage in his day, who controlled autocratically nearly all the artistic production of the France of Louis XIV., and whose magnificent energies, be it owned, seem in these punier days to border on the fabulous. Let us not forget, however, that the gentle Lesueur worked also in those days, and that during the epoch of which the towering wig seems the symbol and the epitome, an artist like Nicolas Poussin found in the large, sad silences of the Roman Campagna the inspiration of his grave and noble works, and that, far from Paris, Claude Lorrain enshrined on canvases that will die not the poem of the setting sun. In the sculpture of the great reign the mannerism caught from Bernini prevailed, but it cannot veil from us, though it sorely mars, the fiery genius of the Provençal, Pierre Puget.

Time suffers me to do no more than glance at the revulsion which followed the death of Louis XIV. The reign of his successor is not one of great architectural activity; it is best mirrored in the minor arts that minister to the comforts of life. The doctrine of discipline and restraint yields now to a new gospel—the gospel of indulgence and ease. A sprightly daintiness presides over all artistic production. The difference between the two reigns is the difference between Madame de Maintenon and Madame du Barry; and the utter relaxation of all restraint in life is curiously featured in the forms imparted throughout to every inanimate thing which is capable of receiving shape. The sinuous curves which already in the days of the Flamboyant style had pushed aside the severer and more noble lines of the perfect Gothic, and had in their turn been held in check by the Latin spirit in the earlier days of the Renaissance, broke bonds when the grave closed over the solemn monarch, and first in France, and then throughout the width of a mimicking Europe, ran riot in the domain of the applied arts. A senseless writhing of unmeaning curves held carnival from that date over every object of use or ornament, and so identified have these forms become with a certain elegance of social *ton* that the most favoured classes all the world over see in them to this day the last word of elegance and taste. You could have no better proof of the lack of all sense of the congruous in decoration than this adoption by society in our time of a style which is the exact mirror of a time so widely different. Yet even in those days of rapid mannerism there were men who escaped the general taint. In architecture a noble severity commends the works of Soufflot and Servandoni, and in painting Chardin employed his delicate gift in the rendering of simple scenes of homely life. But the truest interpreter of whatever was gracious and dainty in this artificial epoch was that greater painter, though not truer artist, J. B. Watteau, whose name is the last I shall bring before you to-night. We find in his work, indeed, no high ideal, no strong imaginative fire—how should we find them seeing what he portrayed?—but in the vivacity and grace of his drawing, in the fascination of his harmonies, rich and suave at once, in the fidelity with which he reflected his times without hinting at their coarseness, this wizard of the brush remains one of the most interesting as he is one of the most fascinating masters of his country's art.

Is there any lesson that we may draw from this hurried survey of artistic evolution among the French? I have dwelt with emphasis on the genius of their Mediæval builders; do I advocate—the young architects for whom I have mainly spoken to-night may ask—do I advocate the adoption of Gothic forms for the purposes of our own lives? I have spoken to little effect if my answer can be doubtful. Artistic forms are the vesture of ideas and the expression of mental conditions; the ideas and mental conditions of our day are widely removed from those of the Middle Ages; the modern mind cannot with fitness put on the garb which was moulded on the mind of a day long past. But if we may not fitly adopt those forms, we cannot too reverently note the spirit which presided over their development, for a like spirit brought to bear on other material and under other conditions may yet bear new and noble fruit. And the characteristics of that spirit are—a masculine independence, a tenacious grasp of central principles, a fearless sincerity in expression, a scorn of shams and trust on truth.

ELECTRIC LIGHTING OF HOUSES.

At the second ordinary meeting of the Dundee Institute of Architecture, Science and Art, Mr. F. Grant Ogilvie, principal of Heriot-Watt College, Edinburgh, delivered a lecture on "Electric Lighting of Houses." Mr. Charles Ower presided. Mr. Ogilvie began by referring to the nature of electric light, and detailed some of the principal facts in relation to electricity which would have to be dealt with in its distribution in houses. He explained how the wire, heated by the electric current, gave off light, but at the same time, when made of certain metals, would melt. The lecturer then demonstrated the manner in which an electric lamp gave out light. The filament in the lamp, being made of carbon, glowed when the current was passing through, and during the process particles of carbon were thrown off, and in time the filament became thinner and thinner until it broke. The average life of a lamp was about 1,000 hours burning. The lecturer then explained the uses of the electric battery, and the signification of the electrical terms ampère and volts, which signified the strength of the current and the difference of electric pressure. By means of diagrams shown on the blackboard with coloured chalks, Mr. Ogilvie represented how electricity could be distributed in houses. The two wires were brought into the house, the one being at an electrical pressure of 100 volts above the other. These two wires were connected by another passing through the lamp, which glowed when the electric current was passed. The fittings for the distribution of the electricity were, he said, of importance. The conductor of the electric current was of copper or an alloy of copper, and to prevent electricity escaping from one wire to another, or into the material of the wall, the copper wire was entirely surrounded by some substance which offered great resistance to the flow of electricity. The way in which wires could be carried over a house was then detailed, and the use of the switch for turning on and off the current minutely explained, a switch being handed round among the audience to clearly show how it acted. It was usual also to have a wire not copper, which formed part of the circuit, and which was of a substance easily fused. The object of this was to prevent any accident occurring in the event of some unforeseen contact between the two wires. This fusible piece of wire prevented the possibility of such an accident, as should such a mishap come to pass the wire fuse and the whole connection were rendered useless. A number of electric lamps suitable for fixing in different positions were exhibited to the audience, and Mr. Ogilvie remarked that it was the exception now to find an ugly electrical fitting. The lecturer at the close referred to the cost of electric light, especially as compared with the cost of gas, and by means of calculations demonstrated how the different prices might be arrived at and compared. Though gas was cheaper than electricity the waste of the latter was very much less, as more gas was used than was actually required. A switch provided in a convenient place at the door of each room would enable one to turn the electric light on or off as desired. The great qualification of electric light, how-

ever, as compared with gas, was that it did not in any way alter the chemical condition of the air. Electricity heated the air, but did not burn it to vitiate it in any way, and the vitiation of the air by gas was the very thing which was to be counterbalanced in the additional price of electric lighting.

THE ANTONINE WALL.

THE monthly meeting of the Glasgow Archæological Society was held on the 17th inst. The subject before the Society was the Antonine Wall, on which four papers were prepared to be delivered as the result of the recent investigations. Mr. William Jolly read the first paper, on "The Exploration of the Antonine Wall: Third Report." He said that a very large number of cuttings had been made, rewarding them with new and valuable insight into the problems involved. The most of the excavations had been made right through from the military way, through the vallum, across the ditch, and through the northern mounds. In the course of his lecture he explained the results obtained at the various points. The chief work was the excavation of the vallum. It became a very important question what was the purpose of the stone structure in its centre. It was suggested that it represented a roadway, but he proved that it was only the basis of the vallum, and consisted of one layer of stone. According to former explorers the vallum was composed of the *débris* taken out of the ditch. He claimed that the chief result of their inquiries was that they had proved that it was built of turf, which was as well laid as the stones of the Hadrian murus. The rubbish from the ditch had been thrown on the northern side to compose the mounds. The breadth of the vallum was 14 feet, but in the course of ages the material had fallen over each side to the extent of 5 feet, making the breadth appear to be 24 feet. As regards the height of the vallum they could only conjecture, but he pointed out that the sentry on the top of the vallum must necessarily have seen the foot of the ditch, otherwise the ditch would have acted as an ambush. The height might have thus been 12½ feet. The second paper in relation to the wa l was "The Vallum, Berm and Fosse—their correlation," by Mr. P. Macgregor Chalmers. He showed that the Roman fortification was designed in strict accordance with the principles of construction. The outline of the fosse was determined by the natural slope of earth. It was shown that the berm, or platform between the vallum and the fosse, was a serious defect, but that it was a necessary feature in an earthwork, and was designed to support the vallum. The relation of the southern slope of fosse to the height of the vallum was also described. The third paper was on "The Theory of a Berm between a Rampart and its Fosse," by Mr. James Lang, and explained the military purposes which were served by a berm. It was a necessary provision in those days from the military point of view, when it was important to keep the attacking force as far from the wall as possible. Mr. George Neilson's paper was the fourth prepared on the subject, and it was on "The Purpose of the Periodic Expansion on the Antonine Wall." At frequent intervals there occurred short circular bulges of the same extraordinary appearances as the vallum. These had now been proved to be of the same substance as the vallum—that was to say, made of sods, as the dark lines running through them indicated. His belief was they had been the stances for the *ballistæ*, which, according to a Roman historian which he quoted, threw a round projectile, and he referred to the fact that round projectiles had been found in the vicinity of the wall.

MYTHE BRIDGE.

IN the list of iron bridges by Thomas Telford will be found one that is described as "Tewkesbury Bridge," which was completed in April 1826. It consists of a single arched span of 170 feet, the rise being 17 feet and the width 27 feet. There are six cast-iron curved ribs, each being 3 feet deep, which were cast in lengths of 22 feet. The iron used was Shropshire No. 2. The ribs are connected by a lattice framing that forms spandrels with the roadway bearers.

The bridge is known in the district as Mythe Bridge, and since November 1 it has been opened free of toll. Last week there was a celebration of the event in Tewkesbury. From a history of the bridge by Mr. Papps it appears that in 1823 an Act of Parliament was obtained which granted powers for raising money for the purpose of bridging the Severn at the Mythe, and for making the necessary roads. The Severn at this point is the line of demarcation between the counties of Worcester and Gloucester. Mr. George Moneypenny was appointed as engineer. After considerable progress had been made with the work it was discovered that the foundations were not sufficiently substantial, and the trustees were prevailed upon to dispense with the services of the engineer. They afterwards sought the services of Mr. Telford, who quickly came to the conclusion that the site for the proposed bridge had been judiciously selected, and after having ascertained by boring that the river bottom and its approaches was of soft alluvial matter, decided that it would be best to span the river with a single cast-iron arch of 170 feet, and so leave the entire waterway free of all impediment. This scheme was approved of by the trustees, and under Mr. Telford's supervision the work was immediately proceeded with. In 1825, however, it was found that erroneous estimates had been made through defective knowledge of the bed of the river, and the subscriptions obtained were inadequate. It was therefore determined in 1825 to go to Parliament for additional powers, but owing to the non-observance of Standing Orders this was delayed. In this emergency Mr. Thomas Taylor, of the Mythe, agreed to advance the whole of the money which was required to complete the bridge and roads on condition that the subscribers would consent to his having a priority of payment both of principal and interest, and that the trustees would apply to Parliament in the ensuing session for an Act to confirm the guarantee thus to be given to him by the subscribers. This was done, and on April 8, 1826, Telford signed a certificate that the contractor, Mr. M'Intosh, had carried out his undertaking, and that the work was complete. The total cost of the bridge with its approaches and roads was upwards of 35,000*l.*, though the original estimate was only 20,700*l.*, which was the amount allowed to be raised by subscription under the powers of the first Act of Parliament. More than 5,500*l.* was expended in procuring Acts of Parliament and in legal proceedings; 1,650*l.* was paid for the Upper Lode Ferry, and 1,031*l.* 17*s.* for the purchase of land; Mr. M'Intosh's contract for masonry, embankments, fencing and extra work amounted to 15,297*l.* 13*s.*; Mr. Hazeldine's for iron, &c., to 4,539*l.* 10*s.*; and Mr. Marson's for the roads, &c., to 5,872*l.* 12*s.* 11*d.*; Mr. Moneypenny's account, as engineer, was 750*l.*; and Mr. Telford's 250*l.*

TRAINING OF ARCHITECTS.

(*Concluded from page* 385.)

REMEMBER that your calling, as I said before, is to design for craftsmen, and this you will not do successfully unless you have a practical knowledge of craftsmanship yourself, which is not to be gained from books or in the office, without resort to the building-sheds, the scaffolding and the workshop. What can be more absurd than to sit all your days indoors designing things which you never see made? You are safe only on the condition of copying accurately what has been done before, because, knowing nothing practically of the working of materials, you may, if you quit the strict path of precedent, be using your material improperly, wastefully, and at the same time ineffectively. Take, for instance, the very common error into which architects have fallen in their use of marble. You have been used to stone, and when an opportunity occurs of using marble, you think you have only to go to work in the same way and your work will be as much finer than masonry as marble is finer than stone. You know, indeed, that marble was not treated in this way of old; but you think, perhaps, you can improve on the flat surfaces, the shallow sinkings and the superficial mouldings of the old men, and do something bolder and better, and so you proceed to work it into the roll mouldings and deep under-cuttings to which you are accustomed in stone. The result, if you have any of the artist in you, will disappoint yourself. One has seen too often examples of marble spoiled in this way with extravagant waste of labour, and an effect, after all, inferior to that of stone. They have failed because the architect has misused his material, and this most likely because he has never practically studied the way of working it. Had he accustomed himself to watch carvers and masons working marble laboriously with drill and chisel, he would have seen why marble was always treated by the masters of old with shallow sinkings and square returns, without under-cutting, and he would have learned that the plain surface treatment he despised was needed to give due effect to the colour and texture of the material. He might even have risen to the notion that Classic architecture itself, which is largely of a marble style, derived its peculiar details from the convenience of the masons who had to work this stubborn material.

Take, again, the case of wrought-iron work. You know from old examples and from drawings that ironwork can be twisted and hammered into certain forms and welded together while hot; but you have never seen a weld made or a scroll beat or hammered into shape. As long as you keep to designs that have been done already you may escape disaster, but if you have the right stuff in you that makes an artist, you will soon grow tired of that, and want to design something original. You make your design and write your instructions with a light heart—"Weld these together"—and so on. As a matter of fact, perhaps the smith cannot weld them, for reasons unknown

to you, but he puts the work together in some other way, as like your drawing as he can, and very likely you are satisfied. But the work nevertheless is a sham; you designed it for welding, and the smith has made it look like welding, when it is really nothing of the kind. Now had you gone and seen him with your drawing, and watched him hammering the iron, you would have understood his difficulty at once, and if you were really an artist you would there and then have taken out your pencil and altered your design to suit and express the methods to which the smith was obliged to have recourse.

I might go on with examples from all the other trades—how, for instance, the work of carpenters and joiners is often doubled uselessly, and the expense also doubled uselessly, by framing being contrived so as to force the craftsman to do by chisel what with a little management you might just as well have enabled him to do by plane. This would be obvious to you at once if you were familiar with the workshop and saw how tools were used, and how labour might be economised. But time forbids me to dwell longer on this subject; you will easily extend to all branches of construction and design the lesson I have tried to point in the foregoing instances. The sum of the matter is that there is no such thing as successful design without the legitimate use of materials; in this lies the secret of good and economical construction and of expressive design. Without it you may sit all day in your office inventing fresh designs, but they will one and all be worthless. And the knowledge necessary to enable you to design sensibly, so as to make the best use of the means at your command, is not to be had from books, but from actual study of good work, both ancient and modern, and from actual contact with handicraft and handicraftsmen. I trust therefore that your educational scheme, which is now in process of elaboration, will include some mode of bringing your students into the workshop among the workmen, not of one or two only, but of all the trades in their turn which it concerns an architect to deal with in the course of his practice. I believe there would be no difficulty in this, so far as the craftsmen are concerned. Nothing would do more to help their work than to have a body of architects to deal with in the future who knew something practically of the trades for which they made designs and specifications, instead of men who, for want of knowledge, frequently set them unnecessary tasks and lay upon them unprofitable labour. I would even go further, and say that it would be extremely desirable that every architect should actually learn some handicraft, so as to understand its difficulties and its possibilities; and by learning these in the case of one craft, he would be better able to appreciate them in the case of the others. But, even if you stop short of this, you may at least approach yourselves to the handicrafts in the way I have suggested by shutting your books and flying off to the workshops, and so learning how to design in a way that gives the workman no unnecessary trouble, makes the most economical and reasonable use of the materials, and satisfies the canon of art which requires that design shall be based upon construction, and be the outward expression of it.

This brings us back to what I said some time ago, that the main thing an architect had to learn was to construct well with an artistic motive. Let us compare this definition with that lately put forth from an authoritative source, and see how they agree. The President of the Royal Institute of British Architects, in his opening address on November 2, defines the ideal architect as "the man who unites the qualities of an artist, a constructor and a man of business." Against this, so far as it goes, I have not a word to say. The inseparable connection—I do not say between architecture and construction, because architecture includes construction—but between design and construction, is the text on which I have been enlarging to-night. If I have said nothing yet about business qualifications, it is not because I undervalue their necessity, but because I have been talking solely of architecture; and business qualifications, though as necessary to an architect as they are to all who mix in the affairs of life, are not architecture, and, moreover, cannot to any very great extent be taught.

But the President goes on to say:—"It is given to few to excel in all [these three qualifications], though there are many who, possessing a general knowledge of each, are proficient in one or the other. And is one who is distinguished by artistic taste to regard with indifference, or a species of contempt, others who may be less artists and more scientists? Or is one whose genius is construction to look askance at others who are more purely artists?" He does not go on to put a similar question with regard to those whose genius is more for business than for art or construction, whose claims to be considered architects he apparently did not find defensible.

Now here I venture, with all respect to the President, to think he is wrong. As Mr. Norman Shaw points out in his letter to the *Times*, "He divides those who practise architecture into three classes—first, those whose proclivities are artistic; second, those whose genius is constructive; and third, those who, *par excellence*, are men of business. We also make this distinction and are fully alive to the necessity of good construction, but we think that the men forming the two last divisions are, as such, not architects at all. The scientific constructor already exists in the engineer, the business man in the surveyor and commission agent."

Now, if it is possible to take an engineer or a surveyor and by endowing him, to use the President's words, with a "general knowledge" of art, thereby to make him an architect, then good-bye to architecture as an art. I have in that case been merely wasting words to-night in trying to explain that architecture is not the result of adding more or less of art to sweeten the bitterness of construction or enliven the dryness of business, but a ruling motive, which must be present from the very beginning, and inspire and govern the construction itself. This view is totally irreconcilable with the officially-pronounced view of the Institute, that a "general knowledge of art" superadded to sound business habits or skill in construction will suffice to make a man an architect.

This definition occurs in the course of the President's defence of the system of examinations conducted by the Institute, and imposed as tests on all who seek to become members of that body. And as our subject to-night is architectural education, it is time to say something on this matter of examination, about which there is, as you know, great difference of opinion, not only between the Institute and outsiders but even within the Institute itself. Examination is the contribution of the Institute to the cause of architectural education. "We do not teach," they say, "but we examine." Their theory is that the necessity of preparing for examination will direct the student in the course of his studies and give him system in his reading. I hope to show you that so far from these examinations being a help to the education of the beginner, they are in fact only a hindrance and distraction.

In the first place, they put before him a wrong motive. He learns, not in order to know but to pass, and he will get no solid good from study pursued with such an object as that. Looking to examination as his goal, he will not—dare not—work in any direction that does not lead that way. He may have a special bias to some particular branch of architecture, and desire for a time to give himself to it exclusively, but he cannot linger; the examination awaits him, and he tears himself away and dilutes his attention to spread it over the whole field of architecture. He may know himself to be ignorant of some other branch of his subject, and wish to work it out thoroughly and master it, but he knows it will not pay with the examiners, and he is forced to content himself with that superficial knowledge which is all he can hope to master in the time and over so large an area of subjects. The system which was promised him for a guide and help proves only a clog to his progress. Let me quote the admirable remarks of Professor Aitchison on this subject:—

"System is an excellent thing, and if it only means the inclusion of what an architect must know, nothing can be said against it. But a man must take care that system does not prevent him learning anything. I have been through examinations, and when I started to prepare myself I spent several days in laying out a systematic course of study, and I endeavoured to follow it, but I found there were subjects that I could not master in the time set down for them. If I had stuck to this systematic system I should have learned nothing, and what I had to do was to learn the subjects and ignore the system."

But, we are told, the examination has the inestimable advantage of enabling the students to test "the extent and accuracy of their knowledge." I believe it does nothing of the kind. On the contrary, it enables them to play off their shallow knowledge or perhaps that of their crammer—for that worthy has, I hear, already appeared on the scene—against the wits of the examiners. In order to pass, the candidate must answer a certain number of questions on a wide range of subjects. It is a pure chance what he will be asked, and he loads his mind with a general superficial knowledge—a kind of mental dust-shot—which spreads so wide as to be sure of hitting something, though it will not penetrate very deep. This is not the kind of examination that enables the student to test his own knowledge. It is not like the examinations of pupils by the tutors under whom they have been working during the term, the object of which is to ascertain whether the lessons have been properly understood. It is not like the examinations at the universities of Oxford and Cambridge, where, again, the subjects are clearly defined and have been all taught during the collegiate course by the same men who examine. The Institute examinations are totally different, for though it examines it does not teach, and has no students.

But the most fatal deception practised upon the innocence of the student is the pretence that it is an examination in architecture at all as an art. It is an examination of what can be learned from books and drawings, but contains no test that the student has ever carried his knowledge afield and tried it in the actualities of life. Accepting for the moment the President of the Institute's threefold division of architecture into art, construction and business habits, it is evident that only one of the

three can really be brought to the test. You may examine a man in construction no doubt—that is to say, in construction apart from art, but how are you to examine him in his business qualifications? I acquit the President of including among these the extraneous pursuits which many men follow besides architecture, such as belong to the land surveyor and estate agent, the lawyer and the speculator in building schemes—a class of pursuits so foreign to architecture that no man who follows the two can hope to succeed in both. I assume him to mean such a faculty for keeping expenditure within bounds, and insuring that his employer gets his money's worth, and of controlling the builder and workman with tact and good temper, as is necessary if things are to go smoothly and well. But who is to examine the student in that? In the first place, it is a matter of habit which can only be acquired by actual experience, which the young architect can only learn as he goes on, for assuredly no one can teach it him, and in the second place it is largely a matter of natural tact and temperament, which may be improved but cannot be supplied if it is absent.

Still less is it possible to bring his artistic qualifications to the test of examination, if there is any truth in the picture I have to-night attempted to draw of what they should be. You may ask him questions in the history of the art: he may satisfy you as to dates and names, periods and examples, but, as I have already said, he may have all that at his fingers' ends, and yet be incapable of architecture. He may be a good antiquary, and yet remain totally devoid of imagination and sense of beauty, without which he can never be an artist. You will never invent any test which you can safely apply to qualifications of this kind; if you try to exercise it you will infallibly fail to keep out those who are unworthy, and probably also shut your door in the face of some heaven-descended genius whose originality you may fail to appreciate.

Observe, I entreat you, that this is not a question of examining for a prize, when you compare one design with others and give the reward to the best. That is easy enough and fair enough, and in its prize funds and scholarships the Institute has a grand opportunity for stimulating and distinguishing art students. But we are now considering a totally different kind of examination—a qualifying one—one for excluding or admitting a student primarily to the ranks of the Institute, and, secondarily, to those of the profession. For though the Institute at present disclaims any ambition to make architecture a close profession under their presidency, still it comes to the same thing, for they aspire to sweep us all into their net, and their dream of the final state of architecture is that every architect shall perforce have passed into the Institute through the gates of examination.

The illustrations by which the President tried to defend examination are altogether irrelevant. "Is not life," he seems to say, "one long examination? Do not artists submit to examination when they send their pictures to the Academy? Does not everyone who is employed practically submit to examination by his employer?" and so on. Now all this is really trailing a red-herring across the path. One might as well ask whether it was not by examination that butcher Jones secured my custom instead of butcher Smith. The examination we protest against is a qualifying one, one which you must pass in order to get your bread in a certain calling; and it is obvious that this is not the case with the President's illustrations. Painters who are rejected at the Academy are not debarred from selling their works to anyone who will buy them, and there is nothing in my dealing with Jones which prevents Smith from selling his mutton to other people.

I do not say that in theory it is absolutely impossible to construct a system of examination so rigid that every incompetent pretender to architecture shall be excluded. But who is to be trusted to keep the door? How many in a generation would be found worthy to pass it? For instance, if it were tried to-morrow, would all the present members of the Institute be found on the inside of the door, or would a good many be left gnashing their teeth on the outside? Such a system of selection is impossible, and yet anything short of it is a mere imposture and a sham. The majority of candidates are and must be mediocrities, and you will have to admit them with their middling gifts, and to suit your standard to their capacities. If you argue that they will at least be no worse for being examined, I reply that they will certainly be no better, and that at all events it would have been something not to have set your seal on them by way of recommending mediocrity to the public.

However, examination is now the banner under which the Institute sails, and the next step is to be the extension of this test to the different grades of that society. The President asks why the Fellows are not to enjoy the same blessings as the Associates, and suggests that they, too, should be required to pass an examination for the higher degree. And so we go on till, if I may be forgiven for trifling with so serious a subject, one may imagine the presidential chair thrown open to competition in order that its occupant may not be excluded from advantages of examination enjoyed by the inferior members.

I have dwelt at some length on this matter of examinations because at the beginning of your new educational system it is all-important that your students should make up their minds what they are trying for, and because, if your schools become mere places for training or cramming architectural students for passing examinations, you are, in my humble opinion, going the safe way to reduce them to uselessness, and to alienate the interest of all who look upon the study of art with different eyes. The note of alarm has already been sounded; when the Institute was considering the question of a grant of money to your schools, one speaker proposed that the grant should be given at the rate of so much a head for every one of your students who passed the Institute examinations. How this was settled I know not, but I do know that the idea that this would be the main motive of your teaching has prevented several architects from aiding you whose advice and experience would have been of infinite service.

Believe me, that if you propose to your students such an end as this, you will be putting before them an unworthy motive, and your schools are predestined to barrenness. On the other hand, tell your students that they come here simply to learn to be architects, without any secondary aim; teach them architecture in all its aspects, constructive and utilitarian, but always in conjunction with good design; make them learn a few things at a time thoroughly rather than many things lightly; insist on their having a reason for what they do, and hold them back from a fresh step till they have mastered the first; bring them as soon as possible into touch with the craftsmen, and make them craftsmen themselves if you can; let them learn from things rather than from books, enlarging their knowledge by experience of technical methods, which is the readiest way of sowing in their minds the seeds of fresh elements of design; above all, teach them to keep bright by constant use such strains of originality as their nature possesses, and you will make your schools true nurseries of architects, though I think it very likely your students would be plucked in the Institute examination.

When I reflect that it is with you, gentlemen, the younger members of our craft, and with those students whom you are now undertaking to train, that the hope of English architecture lies, it seems impossible to overrate the seriousness of the crisis. Your new schools may do much to help our art onwards, or they may aid in stifling it under the dull weight of professionalism. I put before you good and evil, artistic life and artistic slumber; it is for you to make your choice.

THE WORKSHOPS ACT IN LIVERPOOL.

THE Town Clerk of Liverpool has drawn up a report with reference to the Factory and Workshop Act, 1891, which comes into operation on January 1, 1892. He points out that "the principal change effected by the statute is the placing of the sanitary regulation of workshops under the direct control of the sanitary authority instead of under that of the inspector of factories. On receiving notice of the occupation of a workshop the inspector of factories is required to forward the notice forthwith to the sanitary authority. Should the sanitary authority neglect to carry out the provisions of the Act, the factory inspector may, after notice to the authority, take the requisite proceedings and recover the expenses from the sanitary authority. The Secretary of State is also empowered to direct, in case of default, the factory inspector to take action at the expense of the sanitary authority. It will be the duty of the sanitary authority to take action in cases where any workshop or workplace is not kept in a cleanly state or not ventilated in such a manner as to render harmless, as far as practicable, any gases, dust or other impurities generated in the course of the work carried on therein that are a nuisance or injurious to health, or is so overcrowded while work is carried on as to be dangerous or injurious to health, and with regard to other matters of a like character. The sanitary authority and their officers are invested with the same powers with regard to entry, inspection, taking proceedings, &c., as an inspector of factories. The Act applies for the first time the sanitary provisions as to workshops to laundries. A commentator upon the Act says, "The inclusion of laundries is new, and establishes a new principle, for hitherto the factory Acts have been confined to places where things are produced, not where work alone is done." Section 2, subsection 3, enacts that "if any child, young person or woman is employed in a workshop, and the medical officer of the sanitary authority becomes aware thereof, he shall forthwith give written notice thereof to the factory inspector of the district." By section 96 of the Act of 1878 the term "child" is defined as meaning a person under fourteen years, a "young person" as meaning a person of the age of fourteen years and under the age of eighteen years, and a "woman" as a woman of eighteen years or upwards. Section 4, subsections 1 and 2, enact as follows:—1. "Every workshop as defined by the principal Act (including any work-

shop conducted on the system of not employing any child, young person or woman therein) and every workplace within the meaning of the Public Health Act, 1875, shall be kept free from effluvia arising from any drain, water-closet, earth-closet, privy, urinal or other nuisance, and unless so kept shall be deemed to be a nuisance liable to be dealt with summarily under the law relating to public health. 2. Where, on the certificate of a medical officer of health or inspector of nuisances, it appears to any sanitary authority that the limewashing, cleansing or purifying of any such workshop, or of any part thereof, is necessary for the health of the persons employed therein, the sanitary authority shall give notice in writing to the owner or occupier of the workshop to limewash, cleanse or purify the same or part thereof, as the case may require." The important subject of the means of escape in case of fire is also dealt with by the new Act. Section 7 requires with respect to every factory of which the construction is commenced after January 1 next, and in which more than forty persons are employed, that a certificate shall be obtained from the sanitary authority stating that the factory is provided, on the storeys above the ground-floor, with such means of escape in case of fire for the persons employed therein as can reasonably be required under the circumstances of the case. The section makes it the duty of the sanitary authority to examine every such factory, and on being satisfied that the factory is so provided they must give the required certificate.

As regards all factories which are already in existence, or which may be begun to be erected before January 1 next, and in which more than forty persons are employed, the section imposes upon the sanitary authority the duty as soon as may be after the passing of the Act, and afterwards from time to time, of ascertaining whether all such factories within their district are provided with the means of escape in the case of fire already referred to, and, if not, of serving on the owner within the meaning of the Public Health Act 1875 (see section 4 of that Act), a notice in writing specifying the measures necessary for providing such means, and requiring him to carry them out before a specified date. The owner will thereupon, notwithstanding any agreement with the occupier, have power to take the steps necessary for complying with these requirements, and unless they are duly complied with, the owner will be liable to a fine not exceeding 1*l.* for every day that the non-compliance continues. In the event of a difference of opinion arising between the owner and the sanitary authority, it may be referred to arbitration, and provisions with regard to the appointment of arbitrators are contained in the first schedule of the Act. The costs of the arbitration and award are to be paid by such of the parties as the award may direct. The Act of 1891 contains a novel provision intended, no doubt, to have some bearing upon what is known as the "sweating system." The provision is contained in the 27th section, which enacts that the occupier of every factory and workshop (including any workshop conducted on the system of not employing any child, young person or woman therein), and every contractor employed by any such occupier in the business of factory or workshop must, if required to do so by order of the Secretary of State, keep in a form and with particulars prescribed by the Secretary of State, lists showing the names of all persons directly employed by him, either as workman or contractor, in the business of the factory or workshop outside the factory or workshop, and the places where they are employed, and the list is to be open to inspection by any officer of the sanitary authority. If this section is contravened, the occupier or contractor will be liable to a fine not exceeding 40*s.* The definition given in the Acts of a factory and a workshop respectively is too lengthy and complicated to be conveniently included in this report. It may, however, be stated in very general terms, and subject to many extensions and limitations of meaning, that a factory is a place wherein, or within the close or curtilage of which, steam, water, or other mechanical power is used to move or work any machinery employed in preparing, manufacturing and finishing certain classes of articles referred to in the 93rd section of the Factory and Workshop Act, 1878; and that a workshop is any premises, room or place where manual labour is exercised by way of trade or for purposes of gain in or incidental to the making of any article, or of part of any article, or in or incidental to the altering, repairing, ornamenting or finishing of any article, or in or incidental to the adapting for sale of any article, and to which or over which premises, room or place the employer of the persons working therein has the right of access or control. The duties of the sanitary authority under the Acts are, with the exception of the requirements as to means of escape in cases of fire, almost exclusively confined to workshops.

The Newbury Town Council having considered the report of Mr. Baldwin Latham on the three schemes submitted for the drainage scheme, have decided to appoint Mr. Baldwin Latham their engineer, and to instruct him to formulate a scheme for the drainage of the district.

PROPOSED MARKET IMPROVEMENT IN LEEDS.
